SELECTED WATER RESOURCES ABSTRACTS

THE LIBRARY OF THE
DEC 3 1971
UNIVERSITY OF ILLINOIS
AT URBANA-CHAMPAIGN

VOLUME 4, NUMBER 13
JULY 1, 1971

W71-06456 -- W71-07058

SELECTED WATER RESOURCES ABSTRACTS is published semimonthly for the Water Resources Scientific Information Center (WRSIC) by the National Technical Information Service (NTIS), U.S. Department of Commerce. NTIS was established September 2, 1970, as a new primary operating unit under the Assistant Secretary of Commerce for Science and Technology to improve public access to the many products and services of the Department. Information services for Federal scientific and technical report literature previously provided by the Clearinghouse for Federal Scientific and Technical Information will now be provided by NTIS.

SELECTED WATER RESOURCES ABSTRACTS is available to Federal agencies, contractors, or grantees in water resources upon request to: Manager, Water Resources Scientific Information Center, Office of Water Resources Research, U.S. Department of the Interior, Washington, D. C. 20240.

SELECTED WATER RESOURCES ABSTRACTS is also available on subscription from the National Technical Information Service. Annual subscription is $22 (domestic), $27.50 (foreign), single copy price $3. Certain documents abstracted in this journal can be purchased from the NTIS at prices indicated in the entry. Prepayment is required.

SELECTED
WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center,
Office of Water Resources Research, U.S. Department of the Interior

VOLUME 4, NUMBER 13
JULY 1, 1971

W71-06456 -- W71-07058

Use of funds for printing this publication approved by the Director of the Bureau of the Budget, September 4, 1968.

As the Nation's principal conservation agency, the Department of the Interior has basic responsibilities for water, fish, wildlife, mineral, land, park, and recreational resources. Indian and Territorial affairs are other major concerns of America's "Department of Natural Resources."

The Department works to assure the wisest choice in managing all our resources so each will make its full contribution to a better United States—now and in the future.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifiers which are listed in the **Water Resources Thesaurus** (November 1966 edition). Each abstract entry is classified into ten fields and sixty groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

WRSIC IS NOT PRESENTLY IN A POSITION TO PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas.

Additional "centers of competence" have been established in cooperation with the Environmental Protection Agency, Water Quality Office. A directory of the Centers appears on inside back cover.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Resources Research and other Federal water resources agencies with which the Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangements of this bulletin are welcome.

CONTENTS

FOREWORD_____iii

SUBJECT FIELDS AND GROUPS

(Use Edge Index on back cover to Locate Subject Fields and Indexes in the journal.)

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Non-Water Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

METHODS FOR COLLECTION AND ANALYSIS OF WATER SAMPLES FOR DISSOLVED MINERALS AND GASES,
Geological Survey, Washington, D.C.
Eugene Brown, M. W. Skougstad, and M. J. Fishman.
For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, DC -- $2.00. Geological Survey Techniques of Water-Resources Investigations, Book 5, Chapter A1, 1970. 160 p, 14 fig, 3 tab.

Descriptors: *Water chemistry, *Water analysis, *Surface waters, *Groundwater, *Sampling, Methodology, Chemical analysis, Test procedures, Physical properties, Biological properties, Gases, Laboratory tests, On-site tests, Instrumentation, Dissolved solids.
Identifiers: *Water samples.

Methods used by the U.S. Geological Survey to collect, preserve, and analyze water samples for their content of dissolved minerals and gases are described. Among the topics discussed are selection of sampling sites, frequency of sampling, sampling equipment, sample preservation, laboratory equipment and instrumental techniques, accuracy and precision of analysis, and reporting of results. Seventy-six analytical procedures are given for determining 55 water properties. (Woodard-USGS)

HEAT AND WATER REGIME OF SOME SIBERIAN REGIONS (Russian: Teplovoy i Vodnyy Rezhim Nekotorykh Rayonov Sibiri).
Institute of Geography of Siberia and the Far East, Irkutsk (USSR).

Leningrad, 'Nauka', 1970. 113 p.

Descriptors: *Hydrologic aspects, *Heat balance, *Water balance, *Permafrost, Streamflow forecasting, Soil water, Ice-Water interfaces, Snow surveys, Climatic data, Cold regions, Hydrologic data, Heat budget, Meteorological data, Soils, Hydrogeology, Geomorphology, Land reclamation.
Identifiers: *Siberian regions, Hydrologic areas, Amur Oblast, Transbaykal, Irkutsk Oblast, Yakutsk ASSR, Seasonal fluctuations.

This is a seven-paper collection concerned with the climatic and hydrologic conditions of various regions of Siberia, for the purpose of calculating water and heat balances and dividing the area into regions according to character of runoff, moisture and heat supply. A brief assessment is made of rural hydrologic resources and of the results of studying hydrologic properties of snow cover on taiga landscapes. Of particular interest is the breakdown of vast areas of Siberia into regions according to streamflow, moisture content (soils, snow, groundwater), and heat supply. Subjects covered include a hydrologic description of the Transbaykal and the West Siberian Plain, calculation of heat and water balances in the Irkutsk Oblast, discussion of moisture types in the Amur Oblast, and properties of snow crystals in the central taiga of Western Siberia, study of orographic temperature inversion of air in Eastern Siberia, and ice formation in the southern Yakutsk ASSR. W71-06707

ELEMENTAL AND HYDROLOGIC BUDGETS OF THE PANAMANIAN TROPICAL MOIST FOREST,
Georgia Univ., Athens. Inst. of Ecology.
J. T. McGinnis, and F. B. Golley.
In: Symposium on Sea-Level Canal Bioenvironmental Studies, Proceedings of the 19th Annual Meeting of American Institute of Biological Sciences, September 4-5, 1968, Ohio State University, Columbus. Battelle Memorial Institute, Columbus Laboratories, Paper 14, April 21, 1969. 10 p, 2 fig, 2 tab, 22 ref.

Descriptors: *Rain forests, *Hydrologic cycle, *Ecology, *Food chains, Distribution patterns, Ions, Stable isotopes, Environmental effects, Productivity, Forests.
Identifiers: *Panama.

The tropical moist forest is characterized by a 3-month dry period and occurs extensively in the east-central area of the Republic of Panama and portions of northwestern Colombia. It is the primary region of the interior inhabited by man. Eight one-eighth hectare plots were harvested and analyzed for 13 elements. Movement and storage characteristics and potential inputs to man for nine elemental compartments and seven hydrologic compartments are presented. This report describes some aspects of the movement and storage of stable elements through hydrologic and elemental functions of the tropical moist forest ecosystem. (See also W71-06714) (Knapp-USGS)

WATER RESEARCH.

Allen V Kneese and Stephen C Smith, editors. Papers presented at Seminars in Water Resources Research, sponsored by Resources for the future and the Western Resources Conference, at Colorado State University, July 1965. The John Hopkins Press, Baltimore, Md, 1966. 526 p.

Descriptors: *Water resources, *Water resources development, *Planning, *Water Resources Research Act, Water management (Applied), Evaluation.

These conference papers reflect years of research activity on problems of planning and managing water resources. The following developments over the past decade are highlighted in the papers: (1) clarification and far-reaching applications of economic concepts to water development and use; (2) emphasis on cross-disciplinary research; (3) use of high-speed electronic computers in water management research; (4) emphasis on problems of recreation, water quality, and management of water-associated land used; (5) more research on political, administrative, and institutional factors; (6) the new role of federal agencies in water management research; and (7) the impact of the Water Resources Research Act of 1964. The papers are divided into areas including: (1) issues in theoretical economic analysis; (2) case studies of water management; (3) research on evaluation problems; (4) studies of water reallocation; (5) political and administrative studies; (6) research on hydrology and engineering; and (7) major research programs and needs. (See W71-06760 and W71-06761)
W71-06759

MAJOR RESEARCH PROBLEMS IN HYDROLOGY AND ENGINEERING,
William Ackermann.
In: Water Research, The Johns Hopkins Press, Baltimore, Maryland, p 495-501, 1966. 11 ref.

Descriptors: *Information retrieval, *Planning, *Water resources, Engineering geology, Dams.
Identifiers: *Water resources information, Urban hydrology.

Sources of information on water resources problems in general are discussed, such as government publications and publications of activities of professional organizations like the American Geophysical Union. Research problems on hydrology and engineering cited as needing special attention are: river forecasting for water resource mangement, urban hydrology, the engineering and geology of dams, evaporation and transpiration, and prime water resources. (See also W71-06759)
W71-06760

SOME OBSERVATIONS ON RAINFALL AND RUNOFF,
Norman H. Crawford.
In: Water Research The Johns Hopkins Press, Baltimore, Maryland, p 343-353, 1966. 10 fig.

Descriptors: *Runoff, *Runoff forecasting, *Rainfall-runoff relationships, Synthetic hydrology, Volumetric analysis.
Identifiers: *Volume-time distribution.

This paper's purpose is to explain the complex processes involved in finding the volume and time distributuon of runoff; two factors basic to the study of the rainfall-runoff relationship. Illustrations of the role of various basic hydrologic processes are made using digital synthesis models (Standford Watershed Model IV). A schematic description of a watershed, presented in the first section, provides background for concepts and terms which follow. The second section discusses volume of runoff, and the third illustrates timing and runoff distribution. The conclusion comments on education in the response of watersheds to rainfall and on the application of synthesis methods of investigation to water resources studies in general. (See also W71-06759)
W71-06761

THE YEARLY DISTRIBUTION OF RAINFALL INTENSITIES,
For primary bibliographic entry see Field 02B.
W71-06965

AVERAGE INTENSITY OF RAINFALL FOR USE IN THE RATIONAL FORMULA,
H. M. Gifft, and George E. Symons.
Water Wastes Eng, Vol 5, No 12, p 44-45, Dec 1968.

Descriptors: *Hydraulics, *Storm runoff, *Rational formula, *Rainfall intensity.
Identifiers: *Nomograms.

For convenience in design problems concerned with storm flow runoff where climatological data are not available, a monogram is provided and the map of iso intensities are applicable to the following formula, R—5.5 times H5 F (point 2)T (point 5) where: R—rainfall intensity (in./hr.), H5—rainfall intensity (in./hr., 5-year frequency), F—frequency of storms (years), and T—time of concentration (min.).
W71-06966

AVERAGE ANTECEDENT TEMPERATURES AS A FACTOR IN PREDICTING RUNOFF FROM STORM RAINFALL,
Charles D. Hopkins, Jr., and Dale O. Hackett.
J Geophys Res, Vol 66, No 10, p 3313-3318, Oct 1961.

Descriptors: *Rainfall-runoff relationships, *New York, *New England, *Basins, *Storms, Rainfall, Storm runoff, Runoff forecasting.
Identifiers: *Elevation-temperature relationships.

Rainfall-runoff relations in New England and New York have been shown to vary widely from basin to basin in a manner related to average basin latitudes and elevations. Station elevations and latitudes have been shown to be related to average temperatures. Average monthly and annual temperatures were computed for each basin sampled and average weekly basin temperatures estimated. These weekly temperatures were used to derive an index of average antecedent basin temperature based on a logarithmic recession. Two rainfall-runoff relationships were derived in which the index of antecedent basin precipitation, the index of average antecedent basin temperatures corresponding to the season of the storm, the average annual basin temperature, storm rainfall, and storm runoff were used. One of these relations applied to the spring and summer, the other to the fall and winter. Testing showed that a large part of the variation in the rainfall-runoff relationship had been removed. It was concluded that average basin temperatures can be used with profit in computing runoff in New England and New York.

California Univ., Davis.
J. Amorocho, and A. Brandstetter.
Journal of Geophysical Research, Vol 72, No 4, p 1145-1164, February 15, 1967. 20 p, 12 fig, 3 tab, 12 ref. OWRR Project B-005-CAL (5).

Descriptors: *Precipitation (Atmospheric), *Distribution patterns, *Rain gages, *Statistical models, Mathematical models, Network design, Rainfall disposition, Mathematical studies, Statistics, Probability, Rainfall-runoff relationships.
Identifiers: Rain gage networks.

The patterns of precipitation near the ground surface during a storm can be described by a filtered input field, which is amenable to mathematical statement and analysis. The filtered input field is generated by a process of smoothing of recording rain gage data, and it reveals the trends of the storm that are significant from the hydrological standpoint. For this purpose, techniques of curve and surface fitting based on the use of the three-parameter gamma distribution and low-order nonorthogonal polynomials were developed and applied to the analysis of precipitation events over a California watershed. These methods can be used for the establishment of criteria for precipitation network design and for the analysis of watersheds as nonlinear systems with distributed input fields. (Knapp-USGS)

A HYDROLOGIC-CLIMATIC DESCRIPTION OF THE WEST SIBERIAN PLAIN (Russian: Gidrologo-Klimaticheskaya Kharakteristika Zapadno-Sibirskoy Ravniny),
V. S. Mezentsev, and I. V. Karnatsevich.
In: Teplovoy i Vodnyy Rezhim Nekotorykh Rayonov Sibiri, Leningrad, 'Nauka', p 23-42, 1970. 20 p, 25 fig, 10 tab, 32 ref.

Descriptors: *Hydrologic data, *Heat balance, *Water balance, *Land reclamation, *Meteorological data, Moisture content, Moisture deficit, Seasonal, Precipitation (Atmospheric), Evaporation, Drainage, Irrigation, Runoff.
Identifiers: *Western Siberia, Moisture surplus.

The natural heat and water balances and resources of Western Siberia are discussed in connection with required norms for hydrologic reclamation of the area. Results are presented in the form of tables and isogram maps showing heat and water balances along with various moisture and heat supply characteristics of the area. A detailed method for refining precipitation totals and for determining moisture content is accompanied by average long-term monthly, seasonal and annual precipitation maps and by maps depicting the annual runoff layer and total evaporation. Heat, precipitation and evaporation surpluses and deficiencies in various physico-geographic zones of the plain are calculated and serve as valid zonal specifications for hydrologic reclamations. Analysis and summarization of the calculations have established that a moisture excess and heat deficiency in the northern part of Western Siberia call for drainage measures, while the southern part of the plain requires irrigation to counter a severe moisture shortage. (See also W71-06707) (Josefson-USGS)
W71-06712

OBSERVATIONS OF RAIN AND HAIL GUSHES AFTER LIGHTNING,
Little (Arthur D.), Inc., Cambridge, Mass.
C. B. Moore, B. Vonnegut, E. A. Vrablik, and D. A. McCaig.
Available from NTIS as AD-713 255, $3.00 in paper copy, $0.95 in microfiche. Paper, 10th Weather Radar Conference, Wash, D.C., April 22, 1963. 16 p, 26 ref.

Descriptors: *Thunderstorms, Correlation analysis, *Rainfall, *Precipitation intensity, Telemetry, Instrumentation, *Hail, Clouds, *Radar, Lightning, New Mexico.
Identifiers: Correlation techniques, Meteorological radar, Radar echo areas.

Observations of thunderstorms in New Mexico were made with a vertically-scanning, 3 cm radar on a mountain-top. Prior to a lightning stroke the radar echo was usually quite weak indicating precipitation echoes of 5 mm hr-1 or less. Following the lightning stroke it was observed that in the region of the cloud where the stroke took place the radar echo intensity rapidly increased and a gush of rain or hail fell nearby. In some cases after the lightning stroke there were regions in the cloud where the low radar reflectivity decreased instead of increased. These measurements confirm earlier radar observations, made by the authors at Grand Bahama Island B.W.I., which showed that lightning strokes are often followed by the detection of a rapidly-intensifying echo and then by a gush of rain at the ground. The increases and decreases in radar reflectivity in small volumes of the cloud following lightning suggest that the electric discharge is influencing the nature of particles in the cloud.

RAIN-GAUGING PROGRAM TO PROVIDE GUIDE TO STORM SEWER DESIGN,
For primary bibliographic entry see Field 08B.
W71-06964

THE YEARLY DISTRIBUTION OF RAINFALL INTENSITIES,
A. L. H. Gameson, and R. D. Quaife.
Meteorol Mag, Vol 94, No 1115, p 173-180, 1965.

Descriptors: *Rain gages, *Rainfall-runoff relationships, *Hydrologic data.
Identifiers: *Storm sewage, *Great Britain.

Autographic rain-gages were installed at Bradford and Brighouse, Yorks., and Northampton during investigations of the flow and composition of storm sewage. The Northampton data were studied in detail in an attempt to compare the observed runoff distribution from an impermeable area of 115 acres with that calculated from the rainfall pattern. An equation used in the calculation of the probable yearly duration of rainfall intensities exceeding any particular value in inches per hour at a station with a given annual rainfall is presented.

MESOSCALE SPATIAL VARIABILITY IN MIDWESTERN PRECIPITATION,
F. A. Huff, and W. L. Shipp.
J Appl Meteorol, Vol 7, No 5, p 886-891, Oct 1968.

Descriptors: *Rain gages, *Precipitation (Atmospheric), Illinois.
Identifiers: *Variability analysis.

Data from four dense rain gage networks operated for periods of 7 to 12 years on areas of 10 to 550 sq mi in Illinois were used to determine spatial relative variability of monthly and extended period precipitation of storms in continental climate typical of midwestern United States. The relation of storm variability to areal mean precipitation, storm duration, precipitation type, synoptic weather type, season, and size of sampling area was investigated.

FORMATION OF ANTARCTIC BOTTOM WATER IN THE WEDDELL SEA,
Coast Guard, Washington, D.C. Oceanographic Unit.
James M. Seabrooke, Gary L. Hufford, and Robert B. Elder.
Journal of Geophysical Research, Vol 76, No 9, p 2164-2178, March 20, 1971. 15 p, 15 fig, 1 tab, 19 ref.

Descriptors: *Sea water, *Salinity, *Water temperature, *Antarctic, Water circulation, Ocean currents, Ocean circulation, Oceanography.
Identifiers: *Weddell Sea.

During the austral summers of 1968 and 1969, the USCGS Glacier penetrated the pack ice of the Weddell Sea to over 75 deg S. A total of 83 hydrographic stations were conducted during the two expenditions for analysis of temperature, salinity, sissolved oxygen, and nutrients. The data revealed a cold saline layer of water on the continental shelf below a depth of 200 meters in the southwestern Weddell Sea. This water mass is formed by alteration of coastal current water as it flows along and beneath the vast ice shelves in the southern Weddell Sea. The altered coastal current water then mixes with warm deep water along the continental slope in approximately 1:2 to form antarctic bottom water. The mixing ratio is confirmed by using core values of preformed phosphate and performed nitrate concentrations as conservative properties. Antarctic bottom water then flows out of the Weddell Sea between 50 and 15 deg W longitudes and 60 and 65 deg S latitudes. Bottom water flows into the Weddell Sea from the east near the Coats Land coast and is entrained into the antarctic bottom water flowing out. (Knapp-USGS)

MEASURING ILLUMINATION WITHIN SNOW COVER WITH CADMIUM SULFIDE PHOTO RESISTORS,
Forest Service (USDA), Fort Collins, Colo. Rocky Mountain Forest and Range Experiment Station.
James D. Bergen.
USDA Forest Service Research Note RM-181, 1970. 4 p, 3 fig, 6 ref.

Descriptors: *Photometry, *Snowpacks, *Solar radiation, *Telemetry, Instrumentation, Remote sensing, Snow surveys, Water equivalent, Albedo, Ice.
Identifiers: *Photometers.

Light-sensitive cadmium sulfide resistors can measure the downward flux of sunlight in the snow cover. When the variation of sensor response and the absorptivity of ice are considered together with the approximate distribution of energy in the solar spectrum, the variation of cell resistance may be used to estimate light attenuation. (Knapp-USGS)
W71-06495

GRAVIMETRIC ICE THICKNESS DETERMINATION, SOUTH CASCADE GLACIER, WASHINGTON,
Geological Survey, Tacoma, Wash.
Robert M. Krimmel.
Northwest Science, Vol 44, No 3, p 147-153, 1970. 7 p, 3 fig, 3 ref.

Descriptors: *Glaciers, *Gravity studies, *Surveys, Sounding, Washington, Gravimeters, Data collections, Density, Geophysics, Depth.
Identifiers: *Glacier surveys, *Ice thickness (Glaciers).

The vertical dimension of a glacier is the most difficult to measure directly, requiring a large number of expensive bore holes. Of the indirect methods, gravimetric seems most practical because of the large density contrast between ice and rock, known upper surface, and simple field procedure. A gravimetric analysis was carried out on the South Cascade Glacier. This is a small valley glacier (approximately 1 km wide and 3 km long) in the North Cascades of Washington. A Worden model no. 358 gravimeter was used. A bedrock base station was established, and all readings were tied to it in loops not exceeding three hours. Instrument drift was corrected by using this base as a standard and assuming a linear time relationship. A bedrock map based on crevasse patterns and surface velocities agrees fairly well with the gravimetric determination. Combined with other estimations, gravity data can be very useful for determining the bedrock topography. (Knapp-USGS)

DYNAMICS OF ICE-LENS FORMATION IN THE VALLEY OF THE ULAKHAN LEGLIYER RIVER, SOUTHERN YAKUTSK, ASSR (Russian: Dinamika Naledi v Doline R. Ulakhan Legliyer),
V. R. Alekseyev, Yu. A. Gladkiy, and Z. G. Ustinova.
In: Teplovoy i Vodnyy Rezhim Nekotorykh Rayonov Sibiria, Leningrad, 'Nauka', p 108-111, 1970. 4 p, 3 fig, 1 tab.

Descriptors: *Ice, *Discharge (Water), *Permafrost, Surface waters, Frozen ground, Thawing, Rainfall intensity, Freezing, Groundwater, Base flow, Geomorphology, Seasonal, Permafrost.
Identifiers: Yakutsk, ASSR.

The purpose of this paper is to examine ice-lens formation of subpermafrost waters in the valley of one of the Timpton River tributaries (Aldan shield). The ice-lens regimen is closely related to that of ice-forming sources. Three types of water participate in the ice-lens formation during the initial period (November and December): surface, superpermafrost and subpermafrost. Increase in the ice-lens area and thickness is greatest at this time, followed by an uneven development of ice-forming processes, i.e., intensive outflow of ice-forming waters (mainly subpermafrost) alternating with gradual decrease in source discharges. It is assumed that such rhythmic character is due to periodic freezing of the upper parts of outcropping unfrozen spots. Thawing of the ice layer, which begins in May and ends by early August, is most intense during periods of prolonged heavy rain. (See also W71-06707) (Josefson-USGS)

In: Teplovoy i Vodnyy Rezhim Nekotorykh Rayonov Sibiri, Leningrad, 'Nauka', p 102-107, 1970. 6 p, 5 fig, 4 tab.

Descriptors: *Air temperature, *Heat budget, *Thermal stratification, *Permafrost, Orography, Mountains, Geomorphology, Climatic data, Regional analysis, Air-earth interfaces, Seasonal fluctuations.
Identifiers: *Eastern Siberia, Yakutsk ASSR, Temperature inversion.

Data from regimen observations of orographic temperature inversion of a mountain-taiga landscape in Eastern Siberia have established that an inversion layer is formed almost the year-round in areas with a severely dissected plateau relief. The magnitude of inversion, its continuance and the thickness of the inversion layer are considerably greater in winter than during other periods of the year. Orographic temperature inversion of the air has an appreciable effect on the temperature regimen of rocks by lowering the level of heat exchange between the atmosphere-soil and the lithosphere. In the mountain-taiga regions of southeastern Siberia where the average heat exchange level approaches 0 deg. C, inversion leads to a formation of a layer of perennially frozen rocks in valleys and to an increase in their thickness in other regions. The presence of inversion and its high average annual values in Eastern Siberia call for corrections to meteorological observation data used in the calculation of seasonal thawing and freezing depths and in the thermal melioration of soils and rocks. Numerical inversion values should also be considered in any hydrologic regionalization. (See also W71-06707) (Josefson-USGS)

ANNOTATED BIBLIOGRAPHY ON SNOW AND ICE PROBLEMS,
Toronto Univ., Ontario, Canada. Dept. of Geography.
E. C. Relph, and S. B. Goodwillie.
Natural Hazard Research Working Paper No 2, 1968. 13 p.

Descriptors: *Bibliographies, *Snow, *Ice, *Cities, *Snow removal, *Snow management, Melting, Snow cover, Hazards, Deicers, Equipment, Publications, Abstracts, Roads, Governments, Legal aspects, Social aspects, Warning systems.
Identifiers: *Urban snow control.

This paper, a bibliography of 126 references on snow and ice problems, is one in a series on research in progress in the field of human adjustments to natural hazards. It is intended that these papers will be used as working documents by the group of scholars directly involved in hazard research as well as inform a larger circle of interested persons. The annotated bibliography lists publications including bibliographies and general studies, meteorological and climatic studies, studies of the impact of snowfalls, perception of the snow hazard, methods and costs of snow removal and ice control, and methods of snow removal. (Knapp-USGS)

AREAL VARIABILITY OF SNOW COVER CHARACTERISTICS,
Cold Regions Research and Engineering Lab., Hanover, N.H.
T. S. Trifonova.
Available from NTIS as AD-711 868, $3.00 in paper copy, $0.95 in microfiche. Translation of Trudy Glavnoy Geofizicheskey Obserostorii meni A I Voyeykooa, No 130, p 29-37. CRREL Translation, 1970. 14 p.

Descriptors: *Snow cover, *Snow surveys, Density.
Identifiers: Density, USSR, Translations.

The article gives information on the variability in the height and density of snow cover, as well as on the accuracy of determining them in various physical-geographic regions.
W71-06785

THE PROBLEM OF FORMATIONS OF THE ION COMPOSITION AND MINERALIZATION OF FRESH WATER ICE UNDER VARIOUS CONDITIONS,
Cold Regions Research and Engineering Lab., Hanover, N.H.
I. M. Korenouskaya, and M. N. Tarasov.
Available from NTIS as AD-711 873, $3.00 in paper copy, $0.95 in microfiche. Translation of Gidrokhimicheskiy Materialy, Hydrochemical Institute, Novocherkassk, Vol 47, p 77-87, 1968. CRREL Translation, 1970. 20 p.

Descriptors: *Ice, *Salinity, *Sea ice, *Freezing, Chlorides, Sulfates, Carbonates.
Identifiers: USSR, Translations.

The research discussed pursued three main goals: Establishment of the nature of the dependence of the concentration of various ions (Cl (-), SO4 (-2), HCO3 (-)) in the ice on their concentration in the initial solution; Establishment of the nature of the dependence of the concentration of various ions in the ice on the freezing temperature (or, the equivalent, the ice formation rate); and Discovery of whether the standard natural water solutions of the corresponding chemical composition are subject to these relations.

A STUDY OF THE HARDNESS OF ICE,
Cold Regions Research and Engineering Lab., Hanover, N.H.
M. M. Khrushchov, and E. S. Berkovich.
Available from NTIS as AD-716 457, $3.00 in paper copy, $0.95 in microfiche. Translation of: Izvcheniye tverdosti l'da, USSR Academy of Sciences Publishing House. CRREL Translation, Hanover, NH, 1970. 47 p, 25 ref.

Descriptors: *Ice, *Permafrost, *Cold weather construction, *Frozen soils, Snow, Compressability, Loads.
Identifiers: *Ice, Cold weather tests, Brittleness, USSR, Translations.

The present monograph is intended as a systematic presentation of data collected on the hardness of ice by the present authors and other investigators using various methods. It is believed that the monograph will be of general interest to scientists and engineering technical workers concerned in any way with ice, frozen soil, or snow at low temperatures.
W71-06924

THE GENERATION OF ELECTROMOTIVE FORCES DURING THE FREEZING OF WATER,
Columbia Univ., New York. Stanley Thompson Labs.
E. J. Murphy.
Available from NTIS as AD-716 726, $3.00 in paper copy, $0.95 in microfiche. Journal of Colloidal and Interface Science, Vol 32, No 1, p 1-11, Jan 1970. 31 ref.

Descriptors: *Freezing, *Water properties, *Electrolytes.
Identifiers: Electrostatic fields, Molecular association, Electric potential, *Electromotive forces, *Hydrogen bonds.

The electromotive force generated by freezing degassed water in racuo is approximately the same as that generated in water containing dissolved air. The freezing potentials of dilute solutions were measured as a function of concentration. At the higher concentrations the potential is ice-negative, at lower concentrations ice-positive, with respect to the water. The freezing potential for all dilute solutions investigated (except NH4Cl) passes through zero at some concentration in the range 10 to -6 to 10 -5M. The ice-positive potentials are often as high as 120 volts, the ice-negetive ones usually less than 30 volts. The ice-negative potentials are attributed to the entrapment of anions in excess in the ice. To account for the fact that a wide range of chemically different anions are entrapped in excess, the discrimination between ions in the entrapment process is attributed to the hydration shells of the ions. For cations the dipoles are predominantly directed outward, for anions inward leading to an activation energy for capture which is different for oppositely oriented hydration shells.

RADAR SOUNDING OF ANTARCT GLACIERS IN THE SUMMER OF 1967/68,
Arkticheskii i Antarkticheskii Nauchno-I ledovatelskii Institut, Leningrad (USSR).
A. I. Kozlov, and B. A. Fedorov.
Translated from Informatsionnyi Byulleten' Sov skoi Antarticheskoi Ekspeditsii, No 71, p 53, 19 Soviet Antarctic Expedition Information Bullet Vol 7, No 3, p 208-212, January 1971. 5 p, 4 fig.

Descriptors: *Sounding, *Glaciers, *Antarct *Radar, Remote sensing, Profiles, Mapping, I Geomorphology, Surveys.
Identifiers: *Antarctica.

The radio physics group of the Thirteenth Sov Antarctic Expedition made radar soundings glaciers in the Molodezhnaya Station area betw December 1967 and March 1968. Ice thickn was determined seismically (vertical sounding) ten points along the traverse. The surface unde ing the ice is strongly dissected. The only except is the section from the coastline to the 35-km ma The bed has probably been smoothed here by glacier flowing to the sea. (Knapp-USGS)
W71-07014

AMOUNT OF PRECIPITATION AND SNO ACCUMULATION AT VOSTOK STATION,
Arkticheskii i Antarkticheskii Nauchno-I ledovatelskii Institut, Leningrad (USSR).
V. G. Aver'yanov.
Translated from Informatsionnyi Byulleten' Sov skoi Antarticheskoi Ekspeditsii, No 72, p 5, 19 Soviet Antarctic Expedition Information Bulle Vol 7, No 3, p 238-241, January 1971. 4 p, 2 fi tab, 3 ref.

Descriptors: *Snowfall, *Antarctic, Precipitat gages, Water equivalent, Precipitation (mospheric), Water balance, Climatolo Meteorology.
Identifiers: *Antarctica, *Vostok Station (Ant tica).

Vostok Station, Antarctica, conducted simulta ous precipitation and snow accumulation obse tions between 1958 and 1961, and 1963 and 19 The precipitation sum measured by the Tret'ya gage in 9 years of observation was 342 mm o average of 38 mm/year. Snow accumulation determined from systematic (once every 10 day once a month) measurements of the height of snow surface and the specific weight of the sn Snow cover depth was measured with a stake g uated in centimeters at every meter of a c stretched along a profile with sides each 20 m l Total snow accumulation in 9 years was 225.7 of water or an average of 25.1 mm/year. Thus, sum of precipitation exceeded accumulation

50%. This value (1/3) is probably the fraction of the total amount of measured precipitation due to snow blown into the gage. However, this does not take into account the evaporation of snow in summer. Most of the precipitation falls and accumulates during the cold period, from May to October. (Knapp-USGS)

STUDY OF ICE MOVEMENT IN ENDERBY LAND IN 1967,
Arkticheskii i Antarkticheskii Nauchno-Issledovatelskii Institut, Leningrad (USSR).
M. P. Koshelev, and M. V. Aleksandrov.
Translated from Informatsionnyi Byulleten' Sovetskoi Antarticheskoi Ekspeditsii, No 72, p 18, 1968. Soviet Antarctic Expedition Information Bulletin, Vol 7, No 3, p 242-246, January 1971. 5 p, 2 fig, 3 tab, 7 ref.

Descriptors: *Glaciers, *Antarctic, *Surveys, *Movement, Regimen, Icebergs, Rheology, Velocity.
Identifiers: *Antarctica, *Enderby Land (Antarctica).

The results are given of a study of a slow-moving section of ice, located between the Campbell and Hays outlet glaciers, Antarctica. The distance between these glaciers along the coastline is about 40 km, but the ice calves into the ocean across a section not exceeding 16 km in width because of the Thala Hills and other ice-free coastal areas. Ice velocity is small (1-4 m/year). At present, these speeds seem to be characteristic of areas of the Antarctic ice sheet blocked by oases. (Knapp-USGS)

PROBLEM OF THE AMOUNT OF SNOW ACCUMULATING IN CENTRAL ANTARCTICA,
Arkticheskii i Antarkticheskii Nauchno-Issledovatelskii Institut, Leningrad (USSR).
V. G. Aver'yanov.
Translated from Informatsionnyi Byulleten' Sovetskoi Antarticheskoi Ekspeditsii, No 73, p 5, 1969. Soviet Antarctic Expedition Information Bulletin, Vol 7, No 4, p 285-287, February 1971. 3 p, 1 tab, 8 ref.

Descriptors: *Snowfall, *Water equivalent, *Antarctic, *Precipitation gages, Precipitation (Atmospheric), Radioisotopes, Stable isotopes, Tracers, Snowpacks, Stratigraphy, Snow surveys.
Identifiers: *Antarctica, *Vostok Station (Antarctica).

Correct determination of the amount of snow accumulating in Central Antarctica is extremely important for computing the mass gain of the Antarctic ice sheet. The most reliable accumulation data can be obtained by using snow surveys in conjunction with the stratigraphic method (supplemented by the determination of the age of snow with natural and artificial radioisotopes) and comparison of stratigraphic data (including the results of isotope analyses) with snow survey data. The average accumulation rate at Vostok Station is 25-30 mm/year, as determined by three different methods. Accumulation at Vostok Station can be compared with observations at other points in Central Antarctica where the precipitation and deposition conditions are practically the same. (Knapp-USGS)
W71-07020

TEMPERATURE REGIME OF THE CONTINENTAL ICE SHEET IN ENDERBY LAND,
V. Ya. Freyfel'd.
Translated from Informatsionnyi Byulleten' Sovetskoi Antarticheskoi Ekspeditsii, No 73, p 10, 1969. Soviet Antarctic Expedition Information Bulletin, Vol 7, No 4, p 287-290, February 1971. 4 p, 2 fig, 3 tab.

Descriptors: *Ice, *Temperature, *Antarctic, *Seasonal, *Variability, *Heat flow, Heat transfer, Heat balance, Heat budget, Climates, Melting, Ablation.
Identifiers: *Antarctica, *Enderby Land (Antarctica).

Observations on the temperature of the firm-ice layer of the continental ice sheet near the shore of Alasheyev Bight (Enderby Land) Antarctica, were carried out from April 10 through November 21, 1967. The measurements were made in a snow-filled hole approximately 4 km from the shore at an elevation of 280 m above sea level. The hole was made on the ice slope in a region of prevailing snow removal. In the immediate vicinity of the hole were areas that were bare of snow throughout the year. Snow depth at the mouth of the hole was small (from 11 to 35 cm, averaging 18 cm) throughout the observation period and had no significant effect on the temperature regime of the firn-ice layer. The active layer extends to a depth of 17 m in the upper part of the firn-ice cover. The depth of penetration of brief (1-6 days) temperature fluctuations with a systematic reversal of the sign of the gradient does not exceed 0.5-0.6 m. Prolonged intraseasonal temperature fluctuations penetrate to a depth of 2 m in the firn-ice layer. The depth of penetration of seasonal temperature fluctuations, corresponding to the cold and warm periods, reaches 12-13 m. The temperature of the firn-ice layer at the level of attenuation of annual fluctuations is -13 deg C. (Knapp-USGS)
W71-07021

SNOW ACCUMULATION BETWEEN MOLODEZHNAYA STATION AND THE 200-KM MARK,
Arkticheskii i Antarkticheskii Nauchno-Issledovatelskii Institut, Leningrad (USSR).
S. S. Chikovskiy, N. A. Kornilov, and G. V. Konovalov.
Translated from Informatsionnyi Byulleten' Sovetskoi Antarticheskoi Ekspeditsii, No 73, p 62, 1969. Soviet Antarctic Expedition Information Bulletin, Vol 7, No 4, p 315-317, February 1971. 3 p, 1 fig, 3 ref.

Descriptors: *Snowfall, *Snowpacks, *Antarctica, *Snow surveys, Precipitation (Atmospheric), Regimen, Water balance, Climates, Weather, Temperature, Topography.
Identifiers: *Antarctica.

In March 1964 a marked course was laid out in Antarctica from Molodezhnaya Station to the 200-km mark on the continental ice plateau, the markers serving also as snow stakes. Ice thickness was determined by radar, and glaciological observations, including measurements of the increment of snow and its density and determination of the direction and shape of sastrugi, made in a traverse to the 140-km mark in January-February 1968. The profile begins 8 km from the station at an elevation of about 300 m and runs due south. It curves a bit only at 69 deg 00'S to bypass a crevasse zone, and terminates at 60 deg 30'S at an elevation of 2100 m. Repeated observations made it possible to determine total snow accumulation between March 1964 and January 1968.

Department of Energy, Mines and Resources, Ottawa (Ontario). Inland Waters Branch.
I. A. Reid, and J. Shastal.
Copies available from Director, Inland Wates Br., Dept. of Energy, Mines and Resources, 588 Booth St., Ottawa, Canada. Canada, Inland Waters Branch Water Survey, Department of Energy, Mines and Resources, Report Series No 10, 1970. 26 p, 6 fig, 5 map, 31 tab. Published as 2 volumes, under separate covers.

Descriptors: *Glaciers, *Surveys, *Mapping, *Water resources development, *Aerial photography, Regime, Ablation, Melting, Water yield, Streamflow forecasting, Runoff, Runoff forecasting, Snow surveys.
Identifiers: *Canada.

Because glaciers form part of Canada's water resources, some glaciers are surveyed on a continuing basis by the Water Survey of Canada in an effort to determine the extent and pattern of a glacier's influence on surface water runoff. This report summarizes the history of glacier surveys conducted in Canada by the Water Survey of Canada and describes present glacier survey practices. Tables of results for the period of record, some interpretation of these results and the most recent glacier maps are also included. During the summer of 1964, high-quality maps of five selected glaciers in British Columbia were prepared by stereoscopic terrestrial photogrammetric methods. In response to a Branch directive recommending greater use of the metric system, the Water Survey of Canada decided to change from the English to the Metric System in determination of biennial glacier variations. Because 1968 is the year of changeover, it was necessary to compile separate sets of maps using both the English and Metric Systems. (Knapp-USGS)
W71-07037

SNOW FORECASTING FOR SOUTHEASTERN WISCONSIN,
Weather Service Office, Milwaukee, Wis.
Rheinhart W. Harms.
Available from National Technical Information Service as COM-71-00119, $3.00 in paper copy, $0.95 in microfiche. National Oceanic and Atmospheric Administration Technical Memorandum NWSTM CR 38, November 1970. 13 p, 4 fig, 7 ref.

Descriptors: *Weather forecasting, *Snowfall, *Weather patterns, *Wisconsin, *Meteorology, Weather data, Data processing.
Identifiers: *Snow forecasting.

The accuracy of forecast snow accumulation for a particular area depends to a great extent upon the predictability of the track of the associated surface Low center. Of four basic track types which produce heavy snows in southeastern Wisconsin and the lower Great Lakes region, two can be readily recognized in their early stage of development and their deviations are less pronounced and less common. Models constructed of various types of storms indicate most precipitate their heaviest snow 120 to 140 nautical miles to the left of the track of the surface Low depending on the intensity of the storm and the precipitable water available along the storm track. Snow amounts in the heavy snow band correlate very well with the forecast precipitable water in advance of the storm along the storm track. (Knapp-USGS)

2D. Evaporation and Transpiration

ADSORPTION,
American Chemical Society, Washington, D.C.
Joseph H. S. Haggin.
Chemistry, Vol 44, No 4, p 6-9, April 1971. 4 p, 2 fig, 1 tab, 3 ref.

Descriptors: *Adsorption, *Gases, *Water vapor, Oceans, Molecular structure, Evaporation, Heat transfer, Hydrology, Diffusion, Surfaces, Surface tension.

Characteristics of the adsorption of gases to surfaces are described. If a surface is a good desiccant, adsorption of water vapor (drying of the wet material) must occur at a fantastic rate. In fact, for most purposes, adsorption is instantaneous. In most cases, drying of a material or evaporation of a liquid does not occur instantaneously but requires a relatively long time. For instance, the oceans don't dry up but remain at a fairly constant level. Why. Obviously something other than absorption must be involved. If only evaporation of water by desorption from the surface is involved, the maximum possible rate for pure water is about 235 grams per square cm per second. At this rate, the oceans would evaporate totally in a few days. The evaporation rate is controlled by the necessity for evaporated molecules to diffuse through a virtually stagnant layer of water vapor at the ocean's surface. Diffusion is a very slow process. A forest of trees evaporates much more water in a given time than an equal area of ocean surface. (Woodard-USGS)

CALCULATION OF CERTAIN ASPECTS OF THE HEAT AND WATER BALANCE FOR THE LAKE BAYKAL REGION (Russian: Raschet Nekotorykh Elementov Teplovogo i Vodnogo Balansov Dlya Territorii Pribaykal'ya),
N. S. Berkin.
In: Teplovoy i Vodnyy Rezhim Nekotorykh Rayonov Sibiri, Leningrad, 'Nauka', p 43-57, 1970. 15 p, 8 fig, 4 tab, 20 ref.

Descriptors: *Heat balance, *Water balance, *Hydrologic data, *Meteorological data, Evaporation, Moisture content, Runoff, Precipitation (Atmospheric), Meteorology.
Identifiers: Irkutsk Oblast.

Annual values for radiation balance, maximum possible evaporation, total evaporation and total moisture in the Irkutsk Oblast are examined on the basis of average long-term hydrometeorological indices. Particular attention is paid to the methodology and formulas used to determine these characteristics. To calculate annual radiation balance values, an empirical formula is used which associates radiation balance with latitude and height of a point. Maximum possible evaporation, total moisture and total evaporation are computed according to the method of V.S. Mezentsev and are represented on accompanying maps in the form of isograms. Although approximate, these maps show the relationship between water and heat balances and the landscape conditions of the area. Further study in this direction can provide a basis for hydrologic regionalization of the Irkutsk Oblast. (See also W71-06707) (Josefson-USGS)

MOVEMENT OF A MONOMOLECULAR FILM UNDER THE INFLUENCE OF A STEADY WIND,
Bureau of Reclamation, Denver, Colo.
L. A. Dayan.
Available from the National Technical Information Service as PB-193 638T, $3.00 in paper copy, $0.95 in microfiche. Translated from Akademii Nauk Armianskoi SSR Izvestiia, Seriia Tekhnickeskikh Nauk, Vol 16, No 2-3, p 133-168, 1963. Bureau of Reclamation Translation No 529, Denver, Dec 1964. 12 p.

Descriptors: *Monomolecular films, *Evaporation, *Winds, *Evaporation control, Alcohols, Boundry layers, Films.
Identifiers: Coriolis force, USSR, Hexadecanois, *Water conservation, Translations, *Evaporation retarding films.

Using standard equations of motion for the wind near the water and for the water near the lake surface, a formula was derived which was used to predict the velocity with which a monomolecular film is driven across a lake by a uniform wind of a given velocity. The differential equations of motion show that the velocity of movement of the monomolecular film is proportional to the wind velocity. However, the direction of motion of the film does not coincide with the wind direction, due to the effect of the Coriolis force. According to this theoretical derivation, the ratio of wind speed to film speed is equal to 32; whereas field observations show that this ratio is approximately equal to 20. This discrepancy is attributed to the effect of various simplifying assumptions; e.g., the simplification of the equations of motion of the atmosphere, the assumption that the wind velocity is uniform, and the disregard for the effect of temperature differences between various points in the atmosphere.

EVAPORATION AND CLIMATE - A STUDY IN CAUSE AND EFFECT,
Department of Energy, Mines and Resources, Ottawa (Ontario). Inland Waters Branch.
F. I. Morton.
Canada, Inland Waters Branch, Department of Energy, Mines and Resources, Scientific Series No 4, 1968. 32 p , 13 fig, 22 ref.

Descriptors: *Evaporation, *Evapotranspiration, *Climatology, Water balance, Energy budget, Solar radiation, Soil moisture, Weather data, Meteorological data, Synoptic analysis, Evaporation pans, Hydrologic cycle.
Identifiers: *Ireland.

Evaporation from the soil and vegetation surfaces of a region depends on the availability of both water and energy. Water supply variations, by changing the amount of energy used for evaporation and the amount of heat and vapor convected to the air, have substantial effects on the weather and hence on the energy available for evaporation. As the evaporation also has an effect on the water supply there is a problem of feedback and of distinguishing cause from effect. Consideration of energy and vapor transfers suggests that the regional evaporation is equal to the absorbed insolation less the evaporation from a small continuously moist surface, that is, to the absorbed insolation less the potential evaporation, and that the potential evaporation can be calculated from several well known climatological techniques. Such a model permits the regional evaporation, a product of climatic, soil moisture and vegetative processes, to be estimated by use of evaporimeters and weather observations. Differences between annual rainfall and annual runoff for river catchments in Ireland provide reasonable confirmation of the model when compared with predicted values. Analysis of records of evaporation pans and grass evaporimeters located in various parts of Ireland provides further verification and a deeper insight into the implications of the model. (Knapp-USGS)

A STUDY OF THE WATER BALANCE OF A NATURAL CATCHMENT USING A NEUTRON-SCATTERING MOISTURE METER,
Road Research Lab., Crowthorne (England).
J. Prudhoe.
Available from National Technical Information Service as PB-195 919, $3.00 in paper copy, $0.95 in microfiche. Ministry of Transport (Crowthorne, England), Road Research Laboratory Report LR 361, 1970. 12 p, 12 fig, 2 plate, 9 ref.

Descriptors: *Rainfall-runoff relationships, *Water balance, *Soil moisture, *Nuclear moisture meters, Evapotranspiration, Hydrologic budget, Surface-groundwater relationships, Flood forecasting, Runoff forecasting, Streamflow forecasting.
Identifiers: *England.

The water balance of a natural catchment was studied by measuring change in soil moisture with a neutron-scattering moisture meter. The complete water balance was developed for both annual and monthly periods, using soil moisture and their

change in magnitude with the season. The relation between the water balances of monthly duration and of individual storms throughout the year was found; the two water balances show similar seasonal characteristics. The evapotranspiration losses and changes in soil moisture throughout the year were considered from the point of view of flood flow estimation for a given catchment. (K-napp-USGS)

GAMMA-RADIATION DETECTION OF WATER CONTENT IN TWO-DIMENSIONAL EVAPORATION PREVENTION EXPERIMENTS,
Iowa State Univ., Ames. Dept. of Agronomy.
D. Kirkham, D. E. Rolston, and D. D. Fritton.
In: Isotope and Radiation Techniques in Soil Physics and Irrigation Studies, Proceedings Symposium of International Atomic Energy Agency and the Food and Agriculture Organization of the United Nations, Istanbul, June 12-16, 1967: Vienna, IAEA--STI/PUB/158, Paper SM-94/21, p 3-16, 1967. 14 p, 6 fig, 9 ref. OWRR Project A-003-IA (12).

Descriptors: *Evaporation control, *Hydraulic models, *Instrumentation, *Nuclear moisture meters, Gamma rays, Mulching, Evaporation.
Identifiers: Evaporation models.

A gamma scintillation detector system was used to measure water contents in a two-dimensional soil model. The gamma apparatus was built into a lifting apparatus, which accommodates both vertical and horizontal 150 cm long soil columns and 150 by 35 cm two-dimensional soil models. Vertical movement of the gamma apparatus and horizontal movement of the model allow two-dimensional scanning. Water contents in two dimensions were determined for 2 cm simulated rainfall applications for the three treatments. When a subsurface-sand mulch was used, the mulch acted as a barrier to infiltration. Surface-sand mulches conserved more water than did the subsurface-sand mulch, but both the surface and the subsurface sand mulches conserved water as compared with no sand mulch layers. In addition, soil columns, 6.9 cm in diam. and 33 cm tall, were used to study the effectiveness of various thicknesses of surface-sand mulches in preventing evaporation. Thickness of sand mulches did not greatly influence the amount of water conserved if the sand layer was 1 cm or more thick. (K-napp-USGS)

FINITE DIFFERENCE SOLUTION OF THE FLOOD DIFFUSION EQUATION,
Birmingham Univ. (England). Graduate School of Water Resources Technology; Birmingham Univ. (England). Dept. of Civil Engineering; and Essex River Authority (England).
I. E. Thomas, and P. R. Wormleaton.
Journal of Hydrology, Vol 12, No 3, p 211-220, February 1971. 10 p, 4 fig, 7 ref.

Descriptors: *Floods, *Mathematical models, *Water level fluctuations, *Routing, Computer programs, Diffusion, Waves (Water), Theoretical analysis, Numerical analysis, Profiles, Hydrographs, Hydrograph analysis.
Identifiers: Finite difference method.

Application of the flood wave diffusion equation to routing arbitrary input hydrographs involves step computations. The finite difference solutions of the basic equation may be obtained using iteration or matrix inversion techniques. The errors in the different procedures and the digital computational times involved are compared. The Hayami method, which utilizes the closed form solution of the equation for a constant input, is reviewed. Solution of the flood diffusion equation by finite difference methods give results of very high accuracy. The highest accuracies are obtained when the sets of algebraic equations are solved by matrix inversion and the digital computer running time is simultaneously minimized. The maximum node spacing in a particular problem will be controlled by the extent of lateral inflows and in the locations of tributaries but the minimum spacing can then be decided on the basis of the error analysis. WATER RESOURCES OF SPARTANBURG COUNTY, SOUTH CAROLINA,
Geological Survey, Columbia, S.C.
W. M. Bloxham, George E. Siple, and T. Ray Cummings.
South Carolina Water Resources Commission Report No 3, 1970. 112 p, 33 fig, 1 plate, 16 tab, 24 ref.

Descriptors: *Water resources, *Surface waters, *Groundwater, *South Carolina, *Hydrologic data, Data collections, Hydrogeology, Evaluation, Streamflow, Gaging stations, Flow rates, Discharge measurement, Runoff, Stream gages, Geology, Aquifers, Aquifer characteristics, Water yield, Water utilization, Water quality, Chemical analysis, Consumptive use, Meteorology, Hydrology, Water resources development.
Identifiers: *Spartanburg County (S.C.).

The results of a 3-year study of the water resources of Spartanburg County, South Carolina are presented. About 40 percent of the average rainfall in Spartanburg County becomes streamflow. The mean annual discharge of the drainage system is about 1,250 cfs or 1.5 cfs per square mile. However, streamflow is less than this amount more than 70 percent of the time, being sustained by groundwater inflow. Most streams in Spartanburg County contain water having excellent quality for domestic, industrial, and agricultural uses. The dissolved-solids content, is less than 100 mg/l at most locations. Groundwater occurs in the fractured hard rock and mantle of weathered rock throughout Spartanburg County. Well yields range from 1 to 250 gpm and average 20 gpm. The highest average yields of wells in Spartanburg County are obtained from wells drilled in the biotite gneiss and migmatite and the lowest average yields from wells in the quartz monzonite. Analyses of Glenn Springs showed the highest concentration of dissolved solids and the hardest groundwater in the county. (Woodard-USGS)

LOW-FLOW CHARACTERISTICS OF IOWA STREAMS THROUGH 1966,
Geological Survey, Iowa City, Iowa.
Albert J. Heinitz.
Iowa Natural Resources Council Bulletin No 10, 1970. 176 p, 6 fig, 2 plate, 2 tab, 4 ref.

Descriptors: *Streamflow, *Low flow, *Hydrologic data, *Water resources, *Iowa, Gaging stations, Flow rates, Data collections, Stream gages, Discharge measurement, Duration curves, Hydrographs, Flow characteristics, Average flow, Frequency analysis, Maps, Precipitation (Atmospheric), Runoff.
Identifiers: Streamflow characteristics, Historical data.

This report contains information on average discharge, low-flow magnitude and frequency, duration of flow, storage requirements, and regional draft-storage relations for interior streams in the State of Iowa. Data on the duration of flow are given for 113 gaging stations and on low-flow frequency for 77 gaging stations. Storage requirements for selected draft rates are given for 65 gaging stations. Annual 7-day low flows having a recurrence interval of 2 years were computed for 431 low-flow partial-record stations. For some partial-record stations, the 7-day low flow having a recurrence interval of 10 years is also given. These discharges were determined from correlations of periodic low-flow discharge measurements made at the partial-record sites and concurrent discharges at stream-gaging stations. Gaging-station records for the 26-year period 1941-66 were used to define a relationship in which average discharge is a function of size of drainage area and normal annual precipitation for the period 1931-60. The relation can be used to compute the average flow for any location on Iowa streams not significantly affected by regulation. (Woodard-USGS)

STREAMFLOW IN THE UPPER SANTA CRUZ RIVER BASIN, SANTA CRUZ AND PIMA COUNTIES, ARIZONA,
Geological Survey, Washington, D.C.
Alberto Condes de la Torre.
Available from SOD, Washington, DC 20402 - $1.50. Geological Survey Water-Supply Paper 1939-A, 1970. 26 p, 14 fig, 6 plate, 8 tab, 13 ref.

Descriptors: *Streamflow, *Flow measurement, *Hydrologic data, *Arizona, Flooding, Peak discharge, Low flow, Gaging stations, Precipitation (Atmospheric), Data collections, Surface-groundwater relationships, Ephemeral streams, Hydrographs, Frequency analysis, Water resources, Statistical methods.

Identifiers: *Santa Cruz River basin (Ariz).

Streamflow records obtained in the upper Santa Cruz River basin of southern Arizona, United States, and northern Sonora, Mexico, have been analyzed to aid in the appraisal of the surface-water resources of the area. Records are available for 15 sites, and the period of record ranges from 60 yr for the gaging station on the Santa Cruz River at Tucson to 6 yr for Pantano Wash near Vail. The analysis provides information on flow duration, low-flow frequency and magnitude, flood-volume frequency and magnitude, and storage requirements to maintain selected draft rates. Flood-peak information has been projected on a regional basis from which estimates of flood magnitude and frequency may be made for any site in the basin. Most streams in the 3,503 sq-mi basin are ephemeral. Groundwater sustains low flows only at Santa Cruz River near Nogales, Sonoita Creek near Patagonia, and Pantano Wash near Vail. Elsewhere, flow occurs only in direct response to precipitation. The median number of days per year in which there is no flow ranges from 4 at Sonoita Creek near Patagonia to 335 at Rillito Creek near Tucson. The streamflow is extremely variable from year to year, and annual flows have a coefficient of variation close to or exceeding unity at most stations. Most floods result from high-intensity precipitation caused by thunderstorms during the period July to September. Occasionally, when snowfall at the lower altitudes is followed by rain, winter floods produce large volumes of flow. (Woodard-USGS)

STOCHASTIC SIMULATION OF MONTHLY STREAMFLOW BY A MULTIPLE REGRESSION MODEL UTILIZING PRECIPITATION DATA,
Nevada Univ., Reno.
Jochanan Bonne.
Nevada Center for Water Resources Research Report, Reno, July 1970. 48 p, 12 fig, 4 tab, 13 ref. OWRR Project B-024-NEV (1).

Descriptors: *Streamflow, *Model studies, *Stochastic processes, *Simulation analysis, *Regression analysis, Watersheds (Basins), Precipitation (Atmospheric), Mathematical models, Equations, Computers, Computer programs, Evaluation, Synthetic hydrology, Streamflow forecasting.
Identifiers: Stochastic models.

A model for simulation of monthly streamflow series was developed by a multiple regression approach which includes both precipitation and flow. The variables in the regression function represent the previous month's flow, current precipitation, as independent variables, while the dependent variable is the current streamflow. A procedure is suggested for generating precipitation data which can be used in the multiple regression. The frequency distribution of the flow record in each month is determined by statistical analysis. These monthly distributions are later imposed on the model in order to reproduce data with the same statistical parameters and distributions. For each month the optimal combination of variables for the regression model is selected according to least variance, largest coefficient of determination, and the results of significance tests for the regression coefficients. Three watersheds with different physiographic characteristics were selected. Streamflows were simulated for each basin and the results agreed with the historic records of statistical parameters and frequency distribution. (Woodard-USGS)

ANNUAL PEAK DISCHARGES FROM SMALL DRAINAGE AREAS IN MONTANA THROUGH SEPTEMBER 1970,
Geological Survey, Helena, Mont.
M. V. Johnson, and R. J. Omang.
Geological Survey Report, March 1971. 139 p, 1 fig.

Descriptors: *Floods, *Small watersheds, *Streamflow, *Peak discharge, *Montana, Hydrologic data, Gaging stations, Stream gages, Precipitation (Atmospheric), Runoff, Flooding, Frequency analysis, Flood forecasting, Data collections, Discharge measurement, Flood control.

A program to investigate the magnitude and frequency of floods from small drainage areas in Montana was begun July 1, 1955. Originally 45 crest-stage gaging stations were established. The program was expanded to 138 gaging stations in 1959, and to 202 gaging stations in 1963. About 200 stations were in operation from 1963 to 1967, and 185 were in operation in 1968, 1969, and part of 1970. This is the sixteenth annual report prepared to inform the cooperators, and other interested parties, of the status of the program. The report is primarily a tabulation, by water year, of the annual peak stage and discharge at each crest-stage gaging station. Also, it summarizes the activities and progress made during the 1970 water year. The ultimate objective is to obtain enough information on the magnitude and frequency of floods in various sizes and types of drainage basins to help design adequate highway drainage structures throughout the state. (Woodard-USGS)

DRAINAGE AREA STATISTICS FOR THE CHESAPEAKE BAY FRESH-WATER DRAINAGE BASIN,
Johns Hopkins Univ., Baltimore, Md., Chesapeake Bay Inst.
R. C. Seitz.
Chesapeake Bay Institute Special Report 19, Reference 71-1, Johns Hopkins University, February 1971. 21 p, 1 map, 1 graph, 3 tab, 8 ref.

Descriptors: *Watersheds (Basins), *Streams, *Hydrologic data, *Bays, *Statistics, Gaging stations, Rivers, Tributaries, Runoff, Streamflow, Water yield.
Identifiers: *Drainage areas, *Chesapeake Bay inflow.

To sum the tributary inputs into Chesapeake Bay, the fresh-water drainage basin was divided up into 5-nautical mile long segment intervals beginning at the Bay entrance and river mouth locations and extending up to the limit of the tidal effects. Then additional segments, which were less than 5-nautical miles in length, were employed until either a dam or a gaging station was encountered, or until the entire drainage basin of the tributary head waters was defined. All areas in the tables are in square statute miles. The areas are set out in the tables according to rank. The main portion of the Chesapeake Bay is rank 1, a tributary entering the main Bay region is rank 2, etc. There are a total of 5 ranks. All accumulations are started anew with each rank. Fresh-water gaging stations are tabulated. Gaging stations which can be used for the segment under consideration are also given. Flow rates of drainage areas can be obtained at the gaging stations and then this factor can be applied to the segment involved to determine the fresh-water discharge for that drainage area. SUMMARY OF FLOODS IN THE UNITED STATES DURING 1965,
Geological Survey, Washington, D.C.
J. O. Rostvedt.
For sale by Superintendent of Documents, US Government Printing Office, Washington, DC 20402, 60 cents. Geological Survey Water-Supply Paper 1850-E, 1970. 110 p, 52 fig, 34 tab, 26 ref.

Descriptors: *Floods, *Flood damage, *Hydrologic data, *United States, *Rainfall-runoff relationships, Streamflow, Flow measurement, Data collections, Stream gages, Runoff, Peak discharge, Hydrographs, Flood plains, Reviews.
Identifiers: *Flood summary (USA 1965).

This report describes the most outstanding floods in the United States during 1965. The four most damaging floods during the year, by order of decreasing magnitude, were in the South Platte River basin, Colorado (June), the upper Mississippi River basin (March-May), the Arkansas River basin in Colorado, Kansas, and New Mexico (June), and northwestern Missouri (July). The floods in the South Platte River basin were the most damaging in the history of the area. Floods in two separate periods in the upper Mississippi River basin were the most devastating in the history of an area which comprises parts of Minnesota, Wisconsin, Iowa, Illinois, and Missouri. Flood discharges in the Arkansas River basin in Colorado, Kansas, and New Mexico were many times greater than previous maximum discharges. Torrential rains on the Missouri River tributaries caused outstanding floods in a large area extending from the Iowa-Missouri State line on the north to the Blackwater River basin on the south and to the Grand River basin on the east. In addition to these floods, 23 others of lesser magnitude are included in this annual summary. (Woodard-USGS)

WATER RESOURCES OF RACINE AND KENOSHA COUNTIES, SOUTHEASTERN WISCONSIN,
Geological Survey, Washington, D.C.
Richard D. Hutchinson.
For sale by SOD, US Government Printing Office, Washington, DC 20402, $1.25. Geological Survey Water-Supply Paper 1878, 1970. 63 p, 20 fig, 4 plate, 11 tab, 89 ref.

Descriptors: *Wisconsin, *Water resources, *Groundwater, *Aquifers, *Surface waters, Lake Michigan, Streams, Streamflow, Lakes, Water level fluctuations, Wetlands, Hydrologic budget, Water utilization, Groundwater recharge, Groundwater

movement, Floods, Water quality, Urbanization, Surveys, Water resources development.
Identifiers: Inland lakes, Groundwater discharge.

Urbanization and changes in regional development in Racine and Kenosha Counties are increasing the need for water-resources information useful for planning and management. Lake Michigan assures the urbanized area in the eastern part of the two counties of a nearly inexhaustible water supply. In 1967 the cities of Racine and Kenosha pumped 32.6 mgd (million gallons per day) from the lake. Discharge from Racine and Kenosha Counties into Lake Michigan is low and has little effect on the lake. The Root and Pike Rivers and a number of smaller streams contribute a mean flow of about 125 cfs (cubic feet per second) to the lake. Groundwater, approximately 5 cfs, enters the lake as discharge from springs or as seeps. Thirty-five of the 43 lakes in the area are the visible parts of the groundwater table, and their stages fluctuate with changes in groundwater levels. The rest of the lakes are perched above the groundwater table. The sandstone aquifer, a major artesian reservoir underlying all of Racine and Kenosha Counties, is used as a water supply for industries, institutions, and three communities. Pumpage for these uses was about 3.3 mgd in 1967. The Niagara Dolomite is the principal shallow aquifer in the area. In 1967 pumpage from this aquifer for small community, domestic, stock, irrigation, and industrial uses was about 6.8 mgd. A water budget indicates that, of the 32 inches of precipitation that the area annually receives, about 7 inches runs off, and about 25 inches returns to the air as evapotranspiration. WATER WAVES GENERATED BY LANDSLIDES,
Asian Inst. of Tech., Bangkok (Thailand).
Edward Noda.
ASCE Proceedings, Journal of the Waterways, Harbors and Coastal Engineering Division, Vol 96, No WW 4, p 835-855, November 1970. 21 p, 12 fig, 2 tab, 9 ref, append. US Army Corps of Eng. Contract DACW-72-67-C-0002.

Descriptors: *Landslides, *Waves (Water), *Tsunamis, Earthquakes, Reservoir design, Coastal engineering, Shore protection, Model studies, Mathematical models, Hydraulic models.
Identifiers: Landslide effects (Water waves).

The problem of water waves generated by landslides was studied by considering two distinct types of landslide; vertical and horizontal. Vertical landslides were studied by assuming that the landslide is modeled by a two-dimensional box falling vertically. A horizontal landslide is one which enters and moves through the water horizontally and was modeled analytically by a two-dimensional wall which moves into the fluid domain. Theoretical solutions were obtained assuming that the geometric and dynamic parameters of the problem are known. Graphs are presented for motion with constant velocity. For the vertical landslide problem, experiments were performed to verify this theory and the results compare very favorably in the region where linearized theory is valid. An approximate method is developed to find the amplitude of the largest wave in the nonlinear region by utilizing the solutions obtained from linear theory for vertical landslides. This approximate method was applied to the Lituya Bay, Alaska landslide of July 9, 1958 in order to estimate the largest wave. (Knapp-USGS)

STREAMFLOW AND HYDROLOGIC REGIONS OF THE TRANSBAYKAL (Russian: Rechnoy Stok i Gidrologicheskiye Rayony Zabaykal'ya),
Institute of Geography of Siberia and the Far East, Irkutsk (USSR).
G. V. Bachurin.
In: Teplovoy i Vodnyy Rezhim Nekotorykh Rayonov Sibiri, 'Nauka', p 5-22, 1970. 18 p, 3 fig, 1 tab, 26 ref.

Descriptors: *Streamflow, *Hydrologic data, *Meteorological data, Runoff, Geomorphology, Precipitation (Atmospheric), Water balance, Water levels, Floods, Groundwater, Moisture content, Seasonal, Discharge (Water), Mathematical studies, Statistical methods.
Identifiers: *Transbaykal, Hydrologic regionalization.

Because of the great variety of natural conditions in the Transbaykal, average annual maximum and minimum runoff values for adjacent river basins vary widely. Regionalization is particularly important here for facilitating an objective determination of various river regimen indices, water balance and streamflow owing to poor hydrologic coverage of the area. A critical analysis of present plans for a hydrologic regionalization of the Transbaykal is accompanied by a number of fundamental premises for a geographic-hydrologic regionalization. A basic criterion for hydrologic regionalization is a river water regimen expressed quantitatively and qualitatively in annual distribution of runoff, character of high waters, floods, low waters and in maximum water levels and discharges. Analysis of these and other river hydrologic data and an area study of a number of physico-geographic factors, especially relief, have led to the separation of the Transbaykal into 18 hydrologic regions. The new hydrologic regionalization is supported by quantitative descriptions of streamflow that take into consideration average annual runoff, maximum runoff of spring high water and summer-fall floods, minimum runoff in summer and fall and during the winter low-water period. TIDES OFF-SHORE: TRANSITION FROM CALIFORNIA COASTAL TO DEEP-SEA WATERS,
California Univ., San Diego, La Jolla. Inst. of Geophysics and Planetary Physics; and Scripps Institution of Oceanography, La Jolla, Calif.
Walter Munk, Frank Snodgrass, and Mark Wimbush.
Available from National Technical Information Service as AD-716 130, $3.00 in paper copy, $0.95 in microfiche. Geophysical Fluid Dynamics, Vol 1, p 161-235, 1970. 75 p, 21 fig, 2 tab, 43 ref, 2 append. ONR Contract Nonr-2216 (12), Project No 083-502/8-25-69.

Descriptors: *Tides, *California, *Water level fluctuations, *Mathematical models, *Currents (Water), Water circulation, Coasts, Data collections, Data processing, Waves (Water), Ocean currents.
Identifiers: *Tidal currents.

Tidal pressures and currents were measured with self-contained capsules dropped to the sea floor for one month at distances of 175,190, and 500 nautical miles from San Diego. These observations, together with a one-week bottom pressure record at intermediary distances, were analyzed for tidal components by cross-correlation with a noise-free reference time series. Tidal currents turn counterclockwise, and are polarized with maximum flow parallel to shore in the direction of tidal propagation at local high tide. The current amplitude is roughly 2 cm/sec for the semidiurnal component, 1 cm/sec for the diurnal component. To interpret these diverse observations, the dispersion laws were modeled for all possible rotationally-gravitationally trapped waves against a straight coast with shelf. The mathematical model can account for the main features of the observed tidal heights, and gives relative amplitudes at the coast. Tidal currents are not well fitted by the model, and there are problems associated with the separation of barotropic and baroclinic modes, and with the benthic boundary layer. Coastal energy dissipation is small in the sea under investigation, but a 'capacitive' phase delay appears to be associated with Northern California harbors and inland waters. (Knapp-USGS)

ON THE SOLUTION OF TRANSIENT FREE-SURFACE FLOW PROBLEMS IN POROUS MEDIA BY FINITE-DIFFERENCE METHODS,
Oslo Univ. (Norway). Inst. of Geophysics.
Marius Todsen.
Journal of Hydrology, Vol 12, No 3, p 177-210, February 1971. 34 p, 18 fig, 22 ref, 2 append.

Descriptors: *Groundwater movement, *Numerical analysis, *Drainage systems, *Mathematical studies, Theoretical analysis, Computers, Darcys law, Computer programs, Flow, Porous media, Hydraulic conductivity.
Identifiers: *Finite difference method.

Numerical solutions are obtained for a few initial-boundary-value problems in free-surface, saturated liquid flow through porous media. The exact differential equations governing the problems are approximated by finite-difference equations, and the resulting system of algebraic equations is solved by using an automatic digital computer. Only two-dimensional, homogeneous and isotropic flow models - including infiltration - are dealt with, but in principle there is little difficulty in extending the models to nonhomogeneous and anisotropic media. Though also possible in principle, an extension to three dimensions demands a drastic increase in the necessary storage space of the computer. The question of computational stability of the difference schemes adopted is considered. Good agreement with some results of other calculations is found for the two distinct models, one ditch drainage and one earth dam model. (Knapp-USGS)

GROUNDWATER FLOW IN HETEROGENEOUS, ANISOTROPIC FRACTURED MEDIA: A SIMPLE TWO-DIMENSIONAL ELECTRIC ANALOG,
Centre d'Hydrogeologie, Neuchatel, Switzerland. Geological Institute.
L. Kiraly.
Journal of Hydrology, Vol 12, No 3, p 255-261, February 1971. 7 p, 3 fig, 8 ref.

Descriptors: *Analog models, *Groundwater movement, *Anisotropy, *Fractures (Geology), *Aquifer characteristics, Permeability, Transmissivity, Model studies, Simulation analysis, Analog computers, Water levels.
Identifiers: *Permeability tensor.

If two sets of fractures are orthogonal, the principal directions of the permeability tensor are always parallel to the normals of the two sets. Consequently, any desired orientation of the principal directions can be obtained by simple rotation of the two mutually orthogonal sets of fractures. Any permeability tensor can be simulated by two mutually orthogonal sets of fractures (or by three mutually orthogonal sets, in a three-dimensional space). Simulation of a heterogeneous, anisotropic permeability field may be accomplished by dividing the groundwater basin into regions with different permeability tensors. Each fracture geometry can be simulated by a very simple electric analog using conducting stripes painted on nonconducting paper. Consequently groundwater flow can be simulated in a heterogeneous, anisotropic permeability field by the means of a very simple electric analog. This electric analog permits study of the effect of irregularly developed and irregularly connected fractures on the potential field, on the permeability field, and on the folow systems. (Knapp-USGS)

Descriptors: *Groundwater, *Withdrawal, *Water resources development, *Hydrogeology, *Idaho, Water wells, Aquifers, Aquifer characteristics, Water yield, Drawdown, Geology, Water utilization, Water table, Water levels, Streams, Surface-groundwater relationships, Alluvium, Basalts, Water level fluctuations.
Identifiers: *Groundwater hydrology, *Henrys Fork region (Idaho), Volcanic rocks.

The lower Henrys Fork region in eastern Idaho includes the plains and low benches between Ashton and the junction of Henrys Fork and Snake River. The northwestern and western parts of the area are part of the Snake River basalt plain. The central part of the area is occupied by alluvial plains of the Snake, Teton, and Falls Rivers and of Henrys Fork. The alluvial deposits are underlain by basalt. The southeastern part of the area is a bench (Rexburg Bench), chiefly on silicic and basaltic volcanic rocks, which rises gradually to mountain peaks (Big Hole Mountains) southeast of the area. Total withdrawals of groundwater for irrigation in 1962, principally in the Rexburg Bench, were estimated to be 25,000 acre-feet. About 10,000 acre-feet was withdrawn for domestic, municipal, and stock supplies. These withdrawals caused no significant decline in the water table. In the Ashton area, surface-water irrigation has caused water to be perched in basalt above the silicic volcanic rocks, and much of this perched water contributes to streamflow. Some groundwater can be pumped from the basalt for irrigation and other uses. If groundwater were pumped for irrigation, the flow of Henrys Fork would be decreased by the amount of pumped water consumed by crops. Groundwater prospects for irrigation in the Falls River area are not encouraging. (Woodard-USGS)

GEOLOGY AND WATER RESOURCES OF CLAY COUNTY, SOUTH DAKOTA, PART III - BASIC DATA,
South Dakota Geological Survey, Vermillion; and Geological Survey, Washington, D.C.
Cleo M. Christensen, and Jerry C. Stephens.
South Dakota Geological Survey Bulletin 19, 1970. 107 p, 3 fig, 3 tab.

Descriptors: *Water resources, *Groundwater, *Geology, *South Dakota, *Hydrologic data, Data collections, Water wells, Drill holes, Water yield, Water quality, Aquifers, Aquifer characteristics, Water level, Water table, Springs, Hydrogeology, Logging (Recording), Chemical analysis, Pumping, Specific capacity.
Identifiers: *Well data, *Test holes.

This report is a compilation of basic data gathered during a geological and hydrological investigation of groundwater in Clay County, South Dakota in 1963 and 1964. Purpose of the report is twofold: (1) to make basic geologic and hydrologic data available for future planning and study, and (2) as a supplement to related reports already published. The data include logs of wells and test holes, chemical analyses of water from selected wells, records for springs, and maps showing locations of investigations. Each well record also includes owner or use, year completed, depth of well, casing diameter, land-surface altitude, principal aquifer, type of pump, use, water level, date of measurement or visit, specific conductance of water, hardness, and remarks. (Woodard-USGS)

GEOHYDROLOGY OF THE SHALLOW AQUIFERS OF BATON ROUGE, LOUISIANA,
Louisiana State Univ., Baton Rouge. Water Resources Research Inst.
Charles G. Smith, Jr.
Louisiana Water Resources Research Institute Bulletin GT-4, Louisiana State University, October 1969. 31 p, 14 fig, 1 tab, 19 ref. OWRR Projects A-004-LA (4) and B-002-LA (2).

Descriptors: *Hydrogeology, *Aquifers, *Groundwater, *Saline water intrusion, *Louisiana, Water pollution sources, Aquifer characteristics, Pumping, Water yield, Water quality, Hydrologic data, Hydrology, Water wells, Chemical analysis, Chlorides, Industrial water, Drawdown, Groundwater recharge.
Identifiers: *Baton Rouge (La).

The geohydrology of the 10 major aquifers in the Baton Rouge, Louisiana area was studied in order to determine the threat of salt-water intrusion to industrial water supplies. The '400-ft' and '600-ft' sands furnish 22% of the annual groundwater withdrawal from the aquifers. Salt water has been advancing northward toward the industrial center in the '600-ft' sand as a result of hydraulic gradients created by industrial groundwater pumpage. Three miles south of this area, the Baton Rouge fault obstructs the flow of water from the south side of the fault. Apparently the salt water intruding the industrial wells was trapped in the '600-ft' sand north of the fault and an unknown distance west of the Mississippi River. The '400-600 ft' aquifer complex was not affected to any extent by the Denham Springs fault immediately north of the city. Local pinchouts of the two aquifers obstruct flow north and southwest of the industrial area. The Mississippi River indirectly replenishes the '400-600 ft' complex west of the river through the 'University Sand.' Removal of the salt water north of the fault will result in natural replenishment with fresh water. (Woodard-USGS)

METHODS AND APPLICATIONS OF ELECTRICAL SIMULATION IN GROUNDWATER STUDIES IN THE LOWER ARKANSAS AND VERDIGRIS RIVER VALLEYS, ARKANSAS AND OKLAHOMA,
Geological Survey, Washington, D.C.
M. S. Bedinger, J. E. Reed, C. J. Wells, and B. F. Swafford.
Available from SOD, Washington, DC 20402, $1.00. Geological Survey, Water-Supply Paper 1971, 1970. 71 p, 36 fig, 4 plate, 3 tab, 27 ref.

Descriptors: *Analog models, *Surface-groundwater relationship, *Alluvial aquifers, *Arkansas, *Oklahoma, Groundwater, Rivers, Valleys, River training, Hydrogeology, Water levels, Pumping, Water level fluctuations, Model studies, Methodology, Reservoirs, Streamflow, Aquifer characteristics, Evaluation.
Identifiers: *Arkansas River Valley, *Verdigris River Valley.

The Arkansas River Multiple-Purpose Plan will provide year-round navigation on the Arkansas River from near its mouth to Muskogee, Okla., and on the Verdigris River from Muskogee to Catoosa, Okla. The altered regimen in the Arkansas and Verdigris Rivers will affect groundwater conditions in the adjacent alluvial aquifers. Analysis and projections of groundwater conditions were made by use of electrical analog models. These models use the analogy between the flow of electricity in a resistance-capacitance circuit an the flow of a liquid in a porous and permeable medium. A test of the validity of the analog to perform as the aquifer would, within the range of historic forces was verified. The verification process consisted of simulating the action of historic forces which had acted upon the aquifer and of duplicating the aquifer response with the analog. Dams on the Arkansas and Verdigris Rivers will impose a direct change in water levels in the aquifers adjacent to the rivers. This change will be attenuated by the resultant change in accretion to the aquifer. The analogs of aquifers in the valleys were used to determine the change in groundwater level from preconstruction to postconstruction conditions. (Woodard-USGS)

POTENTIAL DEVELOPMENT AND RECHARGE OF GROUNDWATER IN MILL CREEK VALLEY, BUTLER AND HAMILTON COUNTIES, OHIO, BASED ON ANALOG MODEL ANALYSIS,
Geological Survey, Washington, D.C.
Richard E. Fidler.

Available from SOD, Washington DC 20402, $1.00. Geological Survey Water-Supply Paper 1893, 1970. 37 p, 12 fig, 4 plate, 2 tab, 14 ref.

Descriptors: *Withdrawal, *Water level fluctuations, *Drawdown, *Groundwater recharge, *Analog models, Ohio, Hydrogeology, Water wells, Aquifers, Aquifer characteristics, Precipitation (Atmospheric), Water utilization, Artificial recharge, Water yield, Water table, Water levels, Model studies, Water resources development, Water supply.
Identifiers: *Groundwater development.

Mill Creek valley is part of the greater Cincinnati industrial area in southwestern Ohio. In 1964, nearly 30 percent of the water supply in the study area of about 27 square miles was obtained from wells in the glacial-outwash aquifer underlying the valley. Groundwater demand has increased steadily since the late 1800's, and excessive pumpage during the years of World War II caused water levels to decline to critical levels. Natural recharge to the aquifer, from precipitation, is about 8.5 mgd. In 1964, the total water use was about 30 mgd, of which 8.1 mgd was obtained from wells in Mill Creek valley, and the remainder was imported from outside the basin. By the year 2000 groundwater pumpage is expected to exceed 25 mgd. Three hypothetical pumping plans were developed by projecting past pumpage data to the years 1980 and 2000. Various combinations of injection wells were tested on the model under different hypothetical conditions of pumpage. Based on analog model analysis, from three to eight injection wells, with an approximate input of 2 mgd each, would reverse the trend in declining groundwater levels and provide adequate water to meet anticipated demands. (Woodard-USGS)

HYDROLOGY OF LIMESTONE TERRANES - GEOLOGIC INVESTIGATIONS,
Geological Survey of Alabama, University.
John L. Sonderegger, and James C. Kelley.
Available from the National Technical Information Service as PB-198 277, $3.00 in paper copy, $0.95 in microfiche. Alabama Geological Survey Bulletin 94, Part B, 1970. 146 p, 19 fig, 6 plate, 2 tab, 44 ref, 4 append. OWRR Project B-007-ALA (3).

Descriptors: *Hydrogeology, *Karst, *Alabama, Limestones, Groundwater movement, Geology, Mapping, Maps, Geologic investigations, Geologic mapping, Geological surveys, Structural geology.
Identifiers: Athens (Ala).

Limestone hydrology was studied in the Athens and Elkmont 7 1/2-minute quadrangles, an area of about 117 square miles in north-central Limestone County near the center of the northernmost tier of counties in Alabama. Solution activity is shown to be the major factor causing 'deformation' structures in the northern Highland Rim section of the area. Tectonic structure has been modified by groundwater solution. Basic data in the form of measured geologic sections, and well cutting descriptions are provided. In addition, location orientation and number of joints measured in the area are shown on the geologic and contour maps. (Knapp-USGS)

GEOHYDROLOGIC SIGNIFICANCE OF LITHOFACIES OF THE COCKFIELD FORMATION OF LOUISIANA AND MISSISSIPPI AND OF THE YEGUA FORMATION OF TEXAS,
Geological Survey, Washington, D.C.
J. N. Payne.
Available from Superintendent of Documents, Washington, D.C. 20402 - $6.25 (including plates in separate case). Geological Survey Professional Paper 569-B, 1970. 14 p, 2 fig, 8 plate, 1 tab, 63 ref. (Plates under separate cover).

Descriptors: *Hydrogeology, *Gulf Coastal Plain, *Mississippi River basin, *Sandstones, *Aquifers, Louisiana, Mississippi, Texas, Permeability, Groundwater movement, Water quality, Water yield, Stratigraphy, Structural geology, Hydraulics, Sedimentation, Subsurface investigations, Borehole geophysics, Electrical well logging.
Identifiers: Aquifer testing, Pumping tests, Cockfield Formation, Yegua Formation.

Sand-percentage and maximum sand-unit thickness maps show that the Cockfield and Yegua Formations in Louisiana, Mississippi, and eastern Texas consists of sediments deposited in a deltaic-fluvial-lain environment. An interlacing channel system was well developed in the area during Cockfield and Yegua time that is thought to be the record of the ancestral Mississippi and Trinity River systems. Sand percentage and maximum sand-unit thickness suggest that an alongshore and nearshore environment of deposition was predominant. The coefficient of permeability increases with increase in thickness of the sand body. As a consequence of this relation between permeability and thickness, the areas of greater transmissibility are found along channel paths where thick sand units were deposited. The direction of flow of water is toward the gulf coast geosyncline and the Mississippi River alluvial valley, the two principal areas of discharge. The water in and near outcrops contains appreciable amounts of calcium and magnesium. Differences in lithologic distribution and of altitude of the piezometric surfaces are vividly reflected in the regional distribution of the dissolved-solids content of waters. (Knapp-USGS)
W71-06519

AVAILABILITY OF WATER IN THE MISSISSIPPI EMBAYMENT,
Geological Survey, Washington, D.C.
E. M. Cushing, E. H. Boswell, P. R. Speer, and R. L. Hosman.
Available from Superintendent of Documents, Washington, D.C. 20402 - $5.50 (paper cover). Geological Survey Professional Paper 448-A, 1970. 13 p, 7 fig, 7 plate, 3 tab, 86 ref. (Plates published under separate cover.)

Descriptors: *Runoff, *Gulf Coastal Plain, *Groundwater, *Aquifers, *Mississippi River basin, Water resources development, Streamflow, Water yield, Water supply, Transmissivity, Stratigraphy, Climates, Precipitation (Atmospheric), Surface waters, Water levels, Water quality.
Identifiers: *Mississippi embayment, *Water availability.

Most of the Mississippi embayment region is underlain by aquifers that will yield large quantities of water to wells, so that groundwater is the most readily available source of fresh water. Groundwater having a dissolved-solids content of less than 500 ppm is generally available at depths of less than 1,000 feet, and water having a dissolved-solids content of less than 1,000 ppm is available in some places to depths of more than 2,000 feet. Iron is the most common troublesome chemical constituent in the groundwater. The potential yield of the aquifers that underlie the region is estimated to be about 30,000 mgd, of which about 3,000 mgd is presently being withdrawn. Water in varying amounts is also available from streams within the region. The amount of water which originates within the region and which leaves it as streamflow during a year averages about 80,000 mgd. An additional 360,000 mgd leaves the region as streamflow during an average year, this amount having originated outside the region. The 1965 withdrawals from streams within the region were about 1,700 mgd. (Knapp-USGS)

COMBINED KARST AND WATER RESEARCH IN THE DANUBE RIVER SEEPAGE REGION (BADENWURTTEMBERG) IN THE YEARS 1967-1969 (GERMAN),
H. Batsche, F. Bauer, H. Behrens, K. Buchtela, and H. J. Dombrowski.
Steirische Beitrage zur Hydrogeologie, Graz, 1970. 165 p, 72 fig, 5 plate, 15 tab, 87 ref.

Descriptors: *Groundwater movement, *Surface-groundwater relationships, *Tracers, *Karst, Methodology, Geomorphology, Drainage effects, Sinks, Carbonate rocks, Hydrogeology, Rivers, Leakage, Water loss, River beds.
Identifiers: *Danube River (Southwestern Germany).

After two years of preparatory work (hydrogeological detailed mapping and investigation of the contents of environmental isotopes of the waters) a large-scale combined tracing experiment was carried out in the area of the upper Danube (Baden-Wurttemberg, Southwestern Germany) in autumn 1969. In this area the Danube crosses the Jurassic limestone of the Schwabische Alb and loses water into the karstic carbonate rocks. The labelling materials injected in various sinkholes were: 1000 kg KCl, 105 l Dipenten, 8 kg Sulphorhodamine G extra, 250 kg Ammonbromide, 4 l Chrome-51, 20 kg Lanthaninstrate, 400 kg detergents, 75 kg Isobornylacetate, 50 kg sodium-fluorescine, Serratia marcenses, 50 t sodium chloride, and 28 kg brown and green dyed Lycopodium spores. The cooperative experiment of institutions of Austria, Germany and Yugoslavia showed, besides the successful trying out of new labelling materials, that the Danube waters reappear in the Aach waters, and influence the groundwater conditions in the entire area between Engen, Beuren and Eigeltingen, even in places where the Jurassic limestones dip below the tertiary sediments (marl and sandstone) towards the South. GEOHYDROLOGIC INVESTIGATIONS IN THE MESILLA VALLEY, NEW MEXICO,
New Mexico State Univ., University Park. Dept. of Civil Engineering.
Andrew M. Taylor.
M Sc Thesis, New Mexico State University, September 1967. 130 p, 5 fig, 1 tab, 24 ref, 8 append. OWRR Project A-008-N MEX (2).

Descriptors: *Groundwater, *Hydrogeology, *Hydrologic data, *New Mexico, Water resources, Geology, Aquifers, Aquifer characteristics, Water sources, Water yield, Water levels, Specific capacity, Water wells, Water quality, Withdrawal, Recharge, Glacial drift, Drawdown, Mathematical model, Evaluation, Water utilization, Hydrographs.
Identifiers: *Mesilla Valley (New Mex).

Well logs, gravity data and static water levels are analyzed to develop a generalized concept of groundwater aquifers of the Mesilla Valley and adjacent areas, New Mexico. The primary source of recharge to the Mesilla Valley aquifer is from excess water applied to the farmlands. During periods of normal surface-water supply, an amount of water approximately equal to the annual recharge is discharged by seepage to a network of drains located throughout the valley. The mean of the normal drain return flow therefore appears to be an approximation of the normal annual recharge. Specific capacities of 23.1 gpm/ft and 8.8 gpm/ft are obtained for Southern Pacific Railroad Company for Lizard Well No. 1 and New Mexico State University Well No. 8, respectively. A safe annual withdrawal of 105,208 acre-feet/year is predicted by estimation of withdrawals from agricultural records versus the corresponding drawdowns of water levels in the aquifer. A formula to predict drawdown from withdrawals of groundwater from the aquifer of the Mesilla Valley was evaluated. The correlation between the mathematical model and observed groundwater changes tested for the drought of 1951 to 1958 is reasonable. (See also W70-04399) (Woodard-USGS)

GROUNDWATER IN THE ADEN SECTOR OF SOUTHERN ARABIA,
Geological Survey, Arlington, Va.
D. J. Cederstrom.
Groundwater, Vol 9, No 2, p 29-34, March-April 1971. 6 p, 2 fig, 10 ref.

Descriptors: *Water resources development, *Water wells, *Deserts, Water supply, Groundwater, Recharge, Water balance, Alluvium, Aquifers, Water table, Hydrogeology.
Identifiers: *Aden, *Arabia.

A reconnaissance of parts of the former West Aden Protectorate, Arabia, enables a characterization of the dominant hydrologic elements. In this desert environment, intermittent streams from the east-west range of mountains provide considerable water for flood irrigation and groundwater recharge of alluvial fans along the Gulf of Aden. High yield wells are developed in the coastal area and in alluvial areas on the back slope facing the Empty Quarter. Groundwater in the interior is generally restricted to areas where wadi flow provides occasional recharge. Relatively few rock wells have been drilled in the area. Many wells in the alluvium yield silty water leading to clogging of the wells and undue pump wear. (Knapp-USGS)

GROUNDWATER FLUCTUATIONS IN RESPONSE TO ARBITRARY PUMPAGE,
Illinois State Water Survey, Urbana.
Allen Moench.
Groundwater, Vol 9, No 2, p 4-8, March-April 1971. 5 p, 6 fig, 10 ref.

Descriptors: *Water level fluctuations, *Unsteady flow, *Groundwater movement, *Withdrawal, *Computer programs, Water table, Aquifers, Drawdown, Hydrogeology, Mathematical studies, Confined water, Artesian wells, Mathematical models, Theis equation, Analog models, Illinois, Simulation analysis.
Identifiers: Artesian aquifers.

The problem of predicting water level changes in an aquifer due to variable pumpage is approached by using the convolution integral. Equations are given for a nonleaky artesian aquifer and a leaky artesian aquifer with negligible storage in the confining layer. Computational results compare favorably with type curves for hypothetical cases with constant pumping. A practical example using variable pumpage from pumping centers shows the applicability of the technique and its value in interpreting water level variations. (Knapp-USGS)

HYDROTHERMAL EXPLOSION CRATERS IN YELLOWSTONE NATIONAL PARK,
Geological Survey, Menlo Park, Calif.
L. J. P. Muffler, D. E. White, and A. H. Truesdell.
Geological Society of America Bulletin, Vol 82, No 3, p 723-740, March 1971. 18 p, 10 fig, 38 ref.

Descriptors: *Craters, *Explosions, *Thermal water, *Steam, National parks, Wyoming, Thermal springs, Subsurface waters, Geothermal studies, Groundwater movement, Surface-groundwater relationships.
Identifiers: *Hydrothermal explosions, *Steam explosions, Yellowstone National Park.

Hydrothermal explosions are produced when water contained in near-surface rock at temperatures as high as perhaps 250 deg C flashes to steam and violently disrupts the confining rock. These explosions are due to the same instability and chain reaction mechanism as geyser eruptions but are so violent that a large proportion of solid debris is expelled along with water and stream. At least ten hydrothermal explosion craters, ranging in diameter from a few tens of feet to about 5000 ft, are in Yellowstone National Park. Eight of these craters are in hydrothermally cemented glacial deposits; two are in Pleistocene ash-flow tuff. Each is surrounded by a rim composed of debris derived from the crater. Geologic relations at the Pocket Basin crater establish that the explosion there took place during the waning stages of early Pinedale Glaciation. An ice-dammed lake may have existed over a hydrothermal system at the Pocket Basin site; the hydrothermal explosion was triggered by the abrupt decrease in confining pressure consequent in sudden draining of the lake. Most of the other explosion craters in Yellowstone Park could have been triggered in the same manner. (Knapp-USGS)

NOTE ON HYDROLOGICAL RESEARCH IN BOTSWANA WITH SPECIAL EMPHASIS ON RESEARCH IN THE HYDROGEOLOGICAL FIELD,
Botswana Geological Survey, Lobatsi.
C. M. H. Jennings.
South Africa Journal of Science, Vol 67, No 1, p 12-21, January 1971. 10 p, 13 ref.

Descriptors: *Surveys, *Hydrogeology, *Water resources development, Aquifers, Borehole geophysics, Water wells, Aquifer characteristics, Transmissivity, Storage coefficient, Safe yield, Infiltration, Water balance, Radioactive dating, Reviews, Foreign research.
Identifiers: *Botswana.

Climatically Botswana is a semi-arid country with a variable and uncertain rainfall. Some rivers in northwestern Botswana are perennial, but all other rivers are ephemeral in nature. Emphasis has been placed for many years on the development and utilization of underground water resources. As a result a considerable body of hydrogeological data has been built up. Research work is also being carried out and this has included the establishment of observation boreholes in selected areas, where by taking daily, weekly or monthly water rest level measurements related to statistics of underground water use and rainfall data, information is being compiled which will lead eventually to determinations on transmissibility, storage capacity, safe yields and infiltration rates for certain important aquifers. As an adjunct to this work systematic chemical analyses and temperature measurements of all groundwaters are carried out. Carbon-14 and tritium dating of groundwaters is in progress. Additional information is being obtained or is planned from resistivity and spontaneous-potential logging of boreholes. (Knapp-USGS)

USE OF GROUNDWATER FOR IRRIGATION IN HAMILTON AND YORK COUNTIES, NEBRASKA,
Geological Survey, Lincoln, Nebr.
Eugene K. Steele, Jr.
Nebraska Water Survey Paper No 27, February 1971. 43 p, 18 fig, 4 tab, 13 ref.

Descriptors: *Groundwater, *Water wells, *Irrigation, *Water level fluctuations, *Nebraska, Withdrawal, Drawdown, Hydrographs, Aquifers, Water yield, Precipitation (Atmospheric), Pumping, Discharge measurement, Hydrologic data, Data collections.
Identifiers: Hamilton and York Counties (Nebr).

About 317,000 acres, or 45 percent of the land in Hamilton and York Counties, Nebraska, is irrigated with water pumped from wells. Beginning in 1961, a downward trend of water levels in wells indicated that the groundwater supply was being depleted progressively in a large part of the two counties. Comparison of water levels in the spring of 1970 with estimated water levels prior to irrigation development indicates a net decrease of nearly 1 million acre-feet in the stored supply. Withdrawal during the 1969 irrigation season (about 400,000 acre-feet) apparently did not contribute significantly to the long-term net decrease; the weighted water-level change (1969 to 1970) corresponded to only a very small change in storage. Hydrographs of water-level changes since 1958 in 10 wells in-

dicate that 1969 pumpage was much less than pumpage in the years 1963-67, when the downward trend of water levels was the steepest. (Woodard-USGS)

SEASONAL VARIATIONS, SULPHUR MOUNTAIN HOT SPRINGS, BANFF, ALBERTA,
Department of Energy, Mines and Resources, Ottawa (Ontario). Inland Waters Branch.
R. O. Van Everdingen.
Canada Dept of Energy, Mines and Resources, Inland Waters Branch Technical Bulletin No 33, 1970. 11 p, 5 fig, 2 tab, 3 ref.

Descriptors: *Water chemistry, *Spring waters, *Hot springs, *Hydrologic data, *Water properties, Fluctuation, Seasonal, Water temperature, Flow, Chemical properties, Chemical analysis, Dissolved solids, Dissolved oxygen, Data collections, Geochemistry, Thermal water, Mineral water, Thermal springs, Hydrogen sulfide.
Identifiers: *Hot Springs (Banff, Alberta), Canada.

Seasonal variations in the physical and chemical parameters of the sulfurous hot springs on Sulphur Mountain near Banff, Alberta, occur between late April and early August as a result of the influx of varying quantities of water having temperatures and dissolved-solids concentrations lower than the sulfurous thermal water. In the absence of accurate discharge measurements, only a 'minimum required' mixing ratio could be calculated, leading to minimum ion concentrations and a minimum temperature for the cooler water. The Kidney Spring just below the Upper Hot Spring, and the Cave Spring behind the Cave-and-Basin Aquacourt were selected as subjects for this program because of their accessibility and the limited amount of human interference with their free flow. The variations in water temperatures and dissolved-solids concentrations for the Kidney Spring and the Cave Spring are shown. The graphical representation of the chemical analyses for the Kidney Spring shows that the low-temperature period is characterized by a decrease in the concentrations of all dissolved components except alkalinity. GEOLOGY AND WATER RESOURCES OF CAMPBELL COUNTY, SOUTH DAKOTA--PART II: WATER RESOURCES,
Geological Survey, Huron, S. Dak.
Neil C. Koch.
South Dakota Geological Survey Bulletin 20, 1970. 38 p, 18 fig, 5 tab, 17 ref.

Descriptors: *Groundwater, *Hydrogeology, *Hydrologic data, *Water resources development, *South Dakota, Aquifers, Aquifer characteristics, Glacial drift, Water sources, Water yield, Water levels, Specific capacity, Water wells, Water quality, Withdrawal, Consumptive use, Irrigation, Domestic water, Recharge, Surface-groundwater relationships, Hydrographs.
Identifiers: *Campbell County (S. Dak.).

Campbell County, an area of 763 square miles, is in the north-central part of South Dakota, is bounded on the west by the Missouri River and on the north by North Dakota. The county is nearly covered by glacial drift and lake deposits of Pleistocene age, and alluvium and colluvium of Holocene age. These sediments range in thickness from a thin veneer to more than 475 feet and overlie the Pierre Shale and Fox Hills Formations of Cretaceous age. A deep-glacial aquifer, composed mostly of outwash, underlies about 20 percent of the county, averages 100 feet in thickness, and contains about 2 1/2 million acre-feet of water in transient storage. This aquifer supplies about 11 percent of the water used in the county. Shallow-glacial aquifers cover 40 percent of the county and yield as much as 500 gpm to wells. There is about 1 million acre-feet of water in transient storage. Shallow aquifer water is more suitable for irrigation than deep aquifer water. Both aquifers contain water that is high in bicarbonate and sulfate. The shallow-glacial water is generally high in calcium, whereas the deep-glacial water is always high in sodium. The artesian Dakota and Fall River aquifers underlie all of Campbell County at a depth of about 2,000 feet. These aquifers furnish water of sufficient quantity for domestic and farm needs by flowing wells. Because of excessive mineralization this water is not suitable for irrigation. (Woodard-USGS)

EFFECT OF STRAIN HISTORY ON LIQUEFACTION OF SAND,
British Columbia Univ., Vancouver. Dept. of Applied Science; British Columbia Univ., Vancouver. Dept. of Civil Engineering; and Partner, Cook, Pickering and Doyle Ltd., Vancouver.
W. D. Liam Finn, Peter L. Bransby, and Dennison J. Pickering.
ASCE Proceedings, Journal of the Soil Mechanics and Foundations Division, Vol 96, No SM 6, p 1917-1934, November 1970. 18 p, 12 fig, 4 ref, append. Nat Res Council of Canada Grant No 1498.

Descriptors: *Soil mechanics, *Sands, *Quicksand, *Shear stress, Soil water, Strain, Earth materials, Seepage, Soil engineering, Soil physical properties, Soil strength.
Identifiers: Liquefaction (Sands).

The resistance of a saturated sand to liquefaction under cyclic loading depends on the void ratio, effective stress system and intensity of cyclic loading. The effect of strain history on the resistance to liquefaction was investigated by means of triaxial and simple shear tests. The resistance of a saturated sand to liquefaction is influenced strongly by the previous strain history. Partial liquefaction, which occurs at small shear strains, greatly increases the resistance to liquefaction in subsequent tests. Cycles of large shear strains, or quasi-static shear strains greater than 7.5%, reduces the resistance to liquefaction. The increase in resistance to liquefaction created by a very small shear strain may result from the elimination of small local instabilities in the original sand structure. The loss of resistance caused by larger shear strains is thought to be due to either the creation of a uniform metastable structure or the development of a non-uniform structure. (Knapp-USGS)

SOIL MOISTURE TYPES OF THE AMUR OBLAST (Russian: Tipy Uvlazhennosti Landshaftov Amurskoy Oblasti),
L. F. Nasulich.
In: Teplovoy i Vodnyy Rezhim Nekotorykh Rayonov Sibiri, Leningrad, 'Nauka', p 58-81, 1970. 24 p, 1 map, 14 ref.

Descriptors: *Soil water, *Soils, *Soil moisture, *Hydrogeology, Geomorphology, Streamflow, Land reclamation, Saturated soils, Soil properties, Flooding, Hydrologic aspects, Drainage, Surface-groundwater relationships, Erosion control, Forest management, Water management (Applied).
Identifiers: *Amur Oblast (USSR).

Natural landscapes of the Amur Oblast are examined from the standpoint of soil water and moisture types. Field studies have established 11 soil moisture types, of which 6 are in the forest zone and 5 in the forest-steppe zone. Landscapes described include waterlogged, forested and meadow high plains, forested and scrub flood plains, water logged and forested high flood plains, forested mountains, meadow low and high flood plains, meadow-steppe, forest-steppe and cultivated high plains. Standard correlations are established for constructing various aspects of the winter hydrothermal regimen of the landscape on the basis of snow gage survey data. Reclamation practices aimed at controlling flooding, waterlogging and excess moisture are required for successful land management of reclaimed and recently meliorated soils of varying moisture. To implement these practices, the causes and extent of waterlogging, characteristics of the relief, and the genesis of physical, chemical and other soil properties must be known. THE NUCLEAR METHOD OF SOIL-MOISTURE DETERMINATION AT DEPTH,
Texas Univ., Austin. Center for Highway Research.
Clarence J. Ehlers, Lymon C. Reese, and James N. Anagnos.
Available from NTIS as PB-194 749, $3.00 in paper copy, $0.95 in microfiche. Research Report 89-4, June 1969. 66 p, 29 fig, 1 tab, 14 ref. DOT supported.

Descriptors: Soil moisture.
Identifiers: *Radiation measuring instruments, *Soil water, *Moisture content, Soils, Performance tests, Neutron absorption, Soil mechanics.

The results are presented of an investigation conducted for the primary purpose of studying the capabilities, limitations, and problems associated with the nuclear method of moisture determination at depth. Nuclear equipment manufactured by Troxler Electronic Laboratories, Inc., was used to measure moisture changes at depth at three different test sites. Moisture contents were obtained using the manufacturer's calibration curve, with the accuracy of the manufacturer's curve being checked in the field by comparing nuclear and gravimetric results. The effect of air gap, the reproducibility of a neutron count, and time and temperature effects were also investigated. The major problem associated with the nuclear method during the investigation was concerned with access-tube installation; a possible solution of the problem in soil containing gravel is discussed. Results showed that the nuclear method of soil-moisture determination was fast and efficient. The accuracy of the nuclear method was found to be satisfactory when compared to gravimetric results, and recalibration of the nuclear equipment was not

necessary. The nuclear method is recommended for studies concerned with the measurement of soil-moisture changes at depth.

SEEPAGE CHARACTERISTICS OF EXPLOSIVELY PRODUCED CRATERS IN SOIL AND ROCK,
Army Engineer Nuclear Cratering Group, Livermore, Calif.; and Army Engineer Waterways Experiment Station, Vicksburg, Miss.
Walter C. Sherman, and Don C. Banks.
Available from NTIS as AD-715 727, $3.00 in paper copy, $0.95 in microfiche. Nuclear Cratering Group Technical Report No 27, Livermore, Calif, Aug 1970. 72 p.

Descriptors: *Soil physical properties, *Permeability, *Seepage, *Rock properties, Groundwater, Porosity, Craters, Excavation, Nuclear explosions, Laminar flow, Mathematical models, Drainage.

This report contains a review of the permeability characteristics of soil and rock formations in both disturbed and undisturbed conditions which are likely to occur in the zones surrounding craters. The report presents methods of determining permeability and tabulates typical values of permeability in a variety of materials. Factors which affect the seepage characteristics of craters are discussed, and a few examples are presented to illustrate the influence of seepage on stability calculations. The data indicate that laminar-flow conditions will prevail in soil and rock formations, dependent upon the size of the pore opening and hydraulic gradient. For a given pore opening, a critical gradient exists above which the flow is found to be turbulent; the technique of constructing flow nets for turbulent flow is illustrated in the report. The correct assessment of seepage conditions in the zones surrounding a crater will depend to a large extent upon the correct evaluation of boundary conditions, such as geological discontinuities and sources of seepage.

AN IRREVERSIBLE THERMODYNAMIC APPROACH TO SIMULTANEOUS MOVEMENT OF WATER, HEAT, AND SALT THROUGH UNSATURATED SOILS,
Battelle-Northwest, Richland, Wash. Pacific Northwest Lab.
C. G. Enfield.
Available from NTIS as BNWL-1429, $3.00 in paper copy, $0.95 in microfiche. Report BNWL-1429, August 1970. 42 p, 2 fig, 48 ref.

Descriptors: Flow, *Thermodynamics, *Heat, *Soil water, Soil moisture, Diffusion, Hydraulic conductivity, Osmotic pressure, *Salts.

Literature was reviewed to obtain the basis for the simultaneous flow of water, heat, and salt through unsaturated soils. Flow theories were developed from the general theory of water flow in saturated soil under isothermal conditions to the analysis of simultaneous solution flow caused by two driving forces, such as water and heat, using irreversible thermodynamics. Based on this review, conclusions were made that the theory of irreversible thermodynamics is the most applicable approach for modeling when both liquid and vapor transport are to be considered.

SOME LIMNOLOGICAL OBSERVATIONS FROM ENDERBY LAND, ANTARCTICA,
Lehigh Univ., Bethlehem, Pa. Center for Marine and Environmental Studies.
E. E. MacNamara.
Translated from Informatsionnyi Byulleten' Sovetskoi Antarticheskoi Ekspeditsii, No 72, 1968. Soviet Antarctic Expedition Information Bulletin, Vol 7, No 3, p 246-255, January 1971. 10 p, 3 fig, 3 tab, 46 ref.

Descriptors: *Limnology, *Antarctic, *Lakes, Ice, Melt water, Water quality, Water chemistry, Primary productivity, Climates, Water balance, Temperature, Thermal stratification.
Identifiers: *Antarctica, *Enderby Land (Antarctica).

The physical and chemical properties and seasonal dynamics of freshwater lakes, ponds, and meltpools of coastal ice-free areas of Enderby Land, Antarctica are discussed. The waters are significantly less mineralized than has been reported in other ice-free areas of the Antarctic. Tentative explanations are location with respect to strom tracks, and true meltwater nature of the lakes. Primary production was variable dependent on many factors. Seasonal temperature cycles in water bodies are factors to be considered in primary production studies. (Knapp-USGS)

STUDY OF LAKES IN THE VICINITY OF MOLODEZHNAYA STATION,
Arkticheskii i Antarkticheskii Nauchno-Issledovatelskii Institut, Leningrad (USSR).
M. V. Aleksandrov, and A. M. Kozlovskiy.
Translated from Informatsionnyi Byulleten' Sovetskoi Antarticheskoi Ekspeditsii, No 72, p 34, 1968. Soviet Antarctic Expedition Information Bulletin, Vol 7, No 3, p 256-259, January 1971. 4 p, 2 fig, 1 tab, 8 ref.

Descriptors: *Limnology, *Antarctic, *Lakes, Ice, Melt water, Water quality, Water chemistry, Primary productivity, Climates, Water balance, Temperature, Thermal stratification.
Identifiers: *Antarctica, *Enderby Land (Antarctica).

In 1967, the glaciological-hydrographic party of the Soviet Antarctic expedition studied the lakes in the coastal area of the western part of Enderby Land. All the lakes encountered are confined to Molodezhnaya Oasis, Vecherniy Oasis, and other small, ice-free land areas. Some shallow and small lakes that lose their ice cover in summer warm up very strongly in summer. Their heat content is quite high. For example, water temperature measurements performed jointly with Japanese scientists on August 25, 1967, in Lake Teploye (provisional name) showed its temperature to be 3.8 deg C in the bottom layer at a depth of 4.8 m, even in the presence of an ice cover 1.6 m thick. All the lakes investigated are fresh, belong to the high-latitude category of lakes, and are fed by snow and ice. They can be divided into two groups according to their ice and thermal regimes: lakes with a persistent ice cover, and lakes that clear of ice in summer. (Knapp-USGS)

CHEMISTRY OF WATER, ICE, AND SNOW IN THE SCHIRMACHER PONDS,
Arkticheskii i Antarkticheskii Nauchno-Issledovatelskii Institut, Leningrad (USSR).
I. M. Simonov, and K. S. Bonch-Osmolovskaya.
Translated from Informatsionnyi Byulleten' Sovetskoi Antarticheskoi Ekspeditsii, No 72, p 41, 1968. Soviet Antarctic Expedition Information Bulletin, Vol 7, No 3, p 260-264, January 1971. 5 p, 2 fig, 1 tab, 8 ref.

Descriptors: *Limnology, *Antarctic, *Lakes, *Water chemistry, Weathering, Saline water intrusion, Melt water, Water quality, Water chemistry, Climates, Water balance, Temperature.
Identifiers: *Antarctica, *Schirmacher Ponds (Antarctica).

The presence of numerous lakes is a characteristic feature of the landscape of the Schirmacher Ponds, Antarctica. There are more than 50 lakes of various sizes in the area. Glacial lakes predominate according to the origin of the water masses and lake basins. The basins were formed by ice excavation. There are also relicit lakes, formed as a result of isolation of sea inlets and lagoons. Most lakes are either drainless or have intermittent drainage. The lakes are fed by meltwater that flows into them only during the short summer, when there is intense melting of numerous snow beds and of the ice slope. In the first five samples, the not readily soluble salts are represented almost exclusively by calcium carbonate, whose content ranges from 0.16 to 0.22 meq/liter. The content of these salts is higher in the waters of Lakes Rozovoye and Krasnoye. In the water sample from Lake Rozvoye, these salts are represented mainly by calcium sulfate (6.38 meq/liter), and in that from Lake Krasnoye, by calcium carbonate (0.54 meq/liter). The water samples from the other lakes do not contain calcium sulfate and their calcium carbonate content is about 0.10 meq/liter; and the content of magnesium carbonate increases gradually from 0.06 to 0.18 meq/liter. All the lakes of the Schirmacher Ponds are fresh. Salts of sea water may penetrate into epishelf lakes because of their contact with the ocean. Sea salts are also brought to the coastal zone of the continent as aerosol by cyclonic winds together with precipitation. Salts are also brought by fresh waters from weathering zones on lakes located in the southern and southeastern parts of Ponds. In the course of weathering, the fresh waters from the continent are enriched with alkali bicarbonates. The freshening effect of snow and ice meltwaters is manifested through an increase of the amount of sulfate, then chloride, and finally, bicarbonate of alkali elements in the Lake waters. PROBLEMS OF THROUGHFALL AND INTERCEPTION ASSESSMENT UNDER TROPICAL FOREST,
University Coll., Dar-es-Salaam (Tanzania).
I. J. Jackson.
Journal of Hydrology, Vol 12, No 3, p 234-254, February 1971. 21 p, 7 fig, 8 tab, 18 ref.

Descriptors: *Tropical regions, *Interception, *Throughfall, *Precipitation (Atmospheric), Statistical methods, Variability, Regression analysis, Evaporation, Forest, Rain forests, Wet climates, Storms.
Identifiers: *Tropical forests.

A rain gaging experiment in a highland area of northern Tanzania showed the influence of skewness and great variability of throughfall data. For heavy storms, large standard errors make interception estimates unreliable. The techniques of analysis used have a considerable influence on throughfall and interception estimates. Since most previous detailed studies were carried out in temperate latitudes, the effect of tropical foliage upon

interception was poorly known. The graph of interception (median values) against gross rainfall indicates a non-linear relationship and also illustrates the considerable scatter of the data. Attempts to fit a polynomial curve and a logarithmic polynomial curve to storms of under 20 mm proved of little value. Interception values range widely both for individual storms and periods in response to climatic and vegetation factors. This study suggests that interception in tropical forests is fairly low compared to that in temperate forests. (Knapp-USGS)

GRAIN SIZE, MINERALOGY AND CHEMISTRY OF A QUICK-CLAY SAMPLE FROM THE ULLENSAKER SLIDE, NORWAY,
San Diego State Coll., Calif.; and Oslow Univ. (Norway). Inst. of Geology.
Richard W. Berry, and Per Jorgensen.
Engineering Geology, Vol 5, No 1, p 73-84, February 1971. 12 p, 7 fig, 5 tab, 13 ref.

Descriptors: *Clays, *Glacial drift, *Quick clays, X-ray diffraction, Differential thermal analysis, Particle size, Clay minerals, Mineralogy, Soil mechanics, Mass wasting, Mechanical properties.
Identifiers: *Norway.

A detailed laboratory study was made of a quick-clay from a recent quick-clay slide at Ullensaker in Romerike, approximately 40 km northeast of Oslo, Norway. The material is a Quaternary glacial clay, deposited in a marine basin. The clay was studied by fractionation according to grain size, and by mineralogical chemical analyses. Water content is 44.2%; plastic limit is 28.5%; content of particles less than 2 microns is 42%; liquid limit is 43.3%; plasticity index is 14.8; and its activity is 0.35. The median size shows that this is a coarse clay, nearly a silt. The clay is poorly sorted. The dominant mineral in the over 4 micron fraction is quartz. The abundance of quartz fell sharply between 4 and 2 microns to a minor constituent in the smaller size ranges. Feldspar follows the same pattern. The 0.2-0.1 micron fraction shows X-ray peak intensities for illite and chlorite far greater than can be explained by the removal of the quartz dilutant. (Knapp-USGS)

GEOCHEMICAL AND GEOLOGICAL RECONNAISSANCE IN THE SEVENTYMILE RIVER AREA, ALASKA,
Geological Survey, Washington, D.C.
Sandra H. B. Clark, and Helen L. Foster.
For sale by Superintendent of Documents, U.S. Government Print Office, Washington, D.C. 20402 - Price $0.25. Geological Survey Bulletin 1315, 1971. 21 p, 9 fig, 1 tab, 14 ref.

Descriptors: *Geology, *Hydrogeology, *Geochemistry, *Alaska, *Mineralogy, Sampling, Streams, Sediments, Rocks, Soils, Metals, Physical properties, Chemical analysis.
Identifiers: *Seventymile River (Alaska).

Geochemical data were secured from 322 stream-sediment samples, 207 rock samples, and 76 soil samples collected in the Seventymile River area. Geochemical anomalies occur in the Flume Creek-Alder Creek, Crooked Creek, American Creek, and Eagle Bluff areas. Gold in the Flume Creek-Alder Creek area south of the Seventymile River is believed to be associated with ultramafic bodies in a fault zone. Placer gold and other metals in anomalous amounts in stream sediments north of the Seventymile River in the Crooked Creek area may be related to dikes and faults that cut Tertiary and Tertiary sedimentary rocks. Geochemical sampling in the American Creek and Eagle Bluff areas did not define any new mineral deposits, but several anomalies of unknown origin are worthy of further investigation. (Woodard-USGS)

DISSOLVED, SUSPENDED AND BED LOAD MOVEMENT PATTERNS IN TWO O'CLOCK CREEK, ROCKY MOUNTAINS, CANADA, SUMMER, 1969,
Alberta Univ., Edmonton.
H. J. McPherson.
Journal of Hydrology, Vol 12, No 3, p 221-233, February 1971. 13 p, 7 fig, 2 tab, 11 ref. NRC of Canada Grant A 4241.

Descriptors: *Sediment yield, *Sediment load, *Small watersheds, *Rocky Mountain Region, Suspended load, Bed load, Aqueous solutions, Sedimentation, Erosion, Sediment transport, Provenance, Sediment discharge.
Identifiers: *Canada, *Alberta (Canada).

During the summer of 1969, 12850 tons of material were removed as suspended sediment load, 440 tons as dissolved load and 65 tons as bed load from Two O'Clock Creek Basin in the Canadian Rockies. This is equivalent to a surface lowering of the basin by 0.0195 inches per year, a figure which agrees very well with rates of denudation reported by researchers for other mountain areas. During the peak snow melt generated flood in early June, 87% of the total sediment load was exported. Most of the remainder was transported out of the basin by a secondary high flow resulting from rainfall and snow melt in early July. The single most intense rainstorm of the season on August 5 and 6 resulted in a minor increase in stream flow but no increase in sediment discharge. (Knapp-USGS)

SEDIMENT TRANSPORTATION MECHANICS: H. SEDIMENT DISCHARGE FORMULAS.

ASCE Proceedings, Journal of the Hydraulics Division, Vanoni, Vito A., Chairman, Task Committee on Sedimentation, Vol 97, No HY4, Paper 8076, p 523-567, April 1971. 45 p, 24 fig, 3 tab, 40 ref.

Descriptors: *Sediment transport, *Bed load, *Sediment load, Sedimentation, Alluvial channels, Discharge (Water), Sediment discharge, Streamflow, Stage discharge relations.
Identifiers: Sediment discharge formulas.

Thirteen well known sediment discharge formulas are presented with a view to making them convenient to use. The basis for each formula is outlined and results of measured bed sediment discharge on two sand bed streams are compared with values calculated with each of the 13 formulas. This is done on a graph of sediment discharge against water discharge for the two streams. In these calculations the relation between water depth, velocity and discharge was calculated by the Einstein-Barbarossa method. These comparisons of results calculated by formulas with measurements and with each other are interesting in that they bring out the great variability of the calculated sediment discharges. However they are of only limited value in determining the general reliability of each formula. (Knapp-USGS)

INITIATION OF RIPPLES ON FLAT SEDIMENT BEDS,
Bechtel Corp., San Francisco, Calif., Slurry Pipeline Development; and University Coll., London (England). Dept. of Civil Engineering.
Philip B. Williams, and Patrick H. Kemp.
ASCE Proceedings, Journal of the Hydraulics Division, Vol 97, No HY4, Paper 8042, p 505-522, April 1971. 18 p, 10 fig, 10 ref, append.

Descriptors: *Channel morphology, *Scour, *Ripple marks, *Sedimentary structures, *Hydraulic models, Alluvial channels, Sediment transport, Bed load, Turbulent flow, Turbulence, Vortices, Velocity, Reynolds number, Flumes, Open channel flow, Particle size.
Identifiers: Sediment transport models.

For natural sands under turbulent water flow, ripples were found in flume tests, to form on a flat bed from small deformations caused by the random action of high turbulent velocities close to the bed. The deformations affect the grain movement pattern so as to form a bed disturbance or collection of grains that induce a separation eddy to form. The height of such a disturbance was found to be of the order of two or three grain diameters, and the height-to-length ratio is of the order of 1 to 100. Sands with median diameters of 137 micron and 495 micron were used in the experiments. The definition of initial movement of fine sediment established by Grass was extended by these experiments to define the critical conditions for the initiation of ripples from a flat bed. Additional experiments were made in which the grain Reynolds Number was varied by varying the temperature and thus the viscosity of the water. The results suggested that the described mechanism of ripple formation does not operate for grains larger than 600 micron at normal temperatures. (Knapp-USGS)

Robert D. Ballard, and Elazar Uchupi.
Bulletin of Marine Science, Vol 20, No 3, p 547-559, 1970. 13 p, 2 fig, 35 ref.

Descriptors: *Continental shelf, *Gulf Coastal Plain, *Sea level, *Water level fluctuations, *Geomorphology, Sedimentation, Stratigraphy, Quaternary Period, Tidal effects, Topography,

Structural geology, Pleistocene Epoch, Paleohydrology.
Identifiers: Historical geology.

Sea-level fluctuations of the Quaternary have greatly influenced the surface morphology of the continental shelf off the gulf coast of the United States. Two prominent shorelines, at 60- and 160-meter depths, and other features found on the gulf shelf can be related to the relatively recent events of the Quaternary, particularly those of the Holocene transgression. Landward of the 40-meter contour, the slow rise of the sea surface and modern sedimentation have produced a complex mixture of topographic expressions. Diapiric structures, which are abundant from De Soto Canyon westward, appear to be of secondary importance in contributing to the shelf's surface relief. (Knapp-USGS)

PHYSICAL PROCESSES OF SEDIMENTATION,
Reading Univ. (England). Sedimentology Research Lab.
John R. L. Allen.
New York, American Elsevier Publishing Company, Inc, $8.50, Earth Science Series No 1, 1970. 248 p.

Descriptors: *Sedimentation, *Sediment transport, *Geomorphology, Sediments, Stratigraphy, Provenance, Sedimentary structures, Deposition (Sediments), Hydraulics, Open channel flow, Alluvial channels, Fluid mechanics, Hydrodynamics, Waves (Water), Winds, Dunes, Tides, Turbidity currents, Glaciers, Glacial drift, Sedimentology.

The properties of sedimentary deposits as related to the physical behavior of the moving fluids encountered naturally in the form of winds, rivers, tides and waves are examined. The material is intended for undergraduates in their second and third years who are relating geology to the physical background of sedimentation, particularly of clastic and bioclastic deposits. The book also serves as a springboard for graduate students who are beginning a training in research in sedimentology. Professional scientists outside the geological field will find the book a guide to fluid dynamics and loose-boundary hydraulics in both industrial and academic applications. Included is a sketch of the physical principles and concepts relevant to the application of fluid dynamics and loose-boundary hydraulics to sedimentation problems of geological interest. This sketch is followed by a more detailed treatment of sedimentation by the wind, in rivers, by waves and tides in shallow water, by turbidity currents at great depth, and by glacier ice. In every case an attempt is made to view the processes quantitatively and to relate as closely as possible the sedimentary products with the processes. (Knapp-USGS)

GEOLOGY, HYDROLOGY, AND GEOPHYSICS OF COLUMBIA SEDIMENTS IN THE MIDDLETOWN-ODESSA AREA, DELAWARE,
Delaware Geological Survey, Newark.
Nenad Spoljaric, and Kenneth D. Woodruff.
Available from NTIS as PB-198 345, $3.00 in paper copy, $0.95 in microfiche. Delaware Geological Survey Bulletin 13, August 1970. 156 p, 23 fig, 10 plate, 13 tab, 15 ref, 4 append. OWRR Project B-002-DEL (2).

Descriptors: *Hydrogeology, *Aquifers, *Delaware, *Alluvial channels, Alluvium, Stratigraphy, Transmissivity, Surveys, Geophysics, Electrical studies, Sediments, Water table, Water yield, Water levels, Water quality, Water sources, Channel morphology, Sedimentation.
Identifiers: Columbia aquifer (Del).

Columbia Formation sediments in the Middletown-Odessa area, Delaware, are composed of boulders, gravels, sands, silts and clays. Subsurface geology was interpreted on the basis of well-log data. The sediments were deposited in channels, flood plains, cut-off meanders, and levees. Twenty-two electrical resistivity soundings and two traverses were made in an attempt to determine the usefulness of the resistivity method in predicting Columbia thickness. Resistivity techniques appear to be useful in determining gross lithologies, but accurate depth solutions are not always possible. The Columbia Formation is the water-table aquifer in the Middletown-Odessa area and in most other parts of the State. Saturated thickness and water levels were determined in the study area by temporary installation of piezometers. The water-table was found to average about 30 feet below land surface in the central part of the study area. The transmissivity of the main paleochannel east of Middletown is about 40,000 gpd/ft. High iron content (1-2 mg/l) and low pH are common, and may present treatment problems. Extrapolation of Columbia aquifer coefficients from one area to another is not reliable and may produce erroneous results. (Knapp-USGS)

SEDIMENT TRANSPORT IN RIVERS AND RESERVOIRS.
Corps of Engineers, Davis, Calif. Hydrologic Engineering Center.

Thomas, William A., Editor. Proceedings of a Seminar on Sediment Transport in Rivers and Reservoirs, Corps of Engineers Hydrologic Engineering Center, April 7-9, 1970, Davis, California, 1970. 145 p.

Descriptors: Conferences, *Sediment transport, *Sedimentation, *Sediment control, Erosion, River training, Sediment load, Computer programs, Model studies.

A U.S. Army Corps of Engineers Seminar was held to discuss sedimentation problems. Sediment problems encountered in water resource projects may be classified as either technical or institutional. Technical problems involve predicting the amount and location of sediment deposits and channel degradation, bed forms and their influence on flow depths, the effect of sediment on water quality, and the influence of sediment on the esthetic value of land surrounding reservoirs. Problems involving navigation requirements and bank stabilization structures require detailed knowledge of sediment movement and the resulting bed forms. In problems involving storage depletion in reservoirs and degradation downstream from dams, less detailed information is required. Because basic relationships governing the response of an alluvial stream to its water-sediment discharge are not clearly established, considerable engineering judgment is required to properly determine and solve sediment problems. Results from both analytical and hydraulic model studies should be interpreted only by experienced investigators. (See also W71-06676 thru W71-06686) (Knapp-USGS)
W71-06675

BASIC SEDIMENTATION PROBLEMS,
Corps of Engineers, St. Louis, Mo. Sediment Investigation Section.
D. C. Bondurant.
In: Proceedings of a Seminar on Sediment Transport in Rivers and Reservoirs, Corps of Engineers Hydrologic Engineering Center, April 7-9, 1970, Davis, California, Paper No 1, 1970. 6 p.

Descriptors: *Sedimentation, *Bed load, *Reservoir silting, *Reviews, *Sediment transport, Research and development, Projects, Research facilities, Programs.

Research in bed load sedimentation is briefly reviewed. Substantial progress has been made in: knowledge of bed forms and their general relationships with the flow; appreciation of the effect of a heavy sediment load near the bed upon the distribution of sediment and velocity in stream flow; appreciation of the fact that there are really two zones of turbulent transport in a stream rather than a single zone; and appreciation of the role of secondary currents in the formation of a channel. For progress to be made toward scientific appraisal of the sediment problems involved in channel and reservoir design, it is necessary to encourage a policy of a review of work being done, to plan investigations so that they will be well coordinated, and to encourage active support of the work. SEDIMENT YIELDS IN THE UPPER MISSISSIPPI RIVER BASIN,
Corps of Engineers, Rock Island, Ill.
Frank J. Mack.
In: Proceedings of a Seminar on Sediment Transport in Rivers and Reservoirs, Corps of Engineers Hydrologic Engineering Center, April 7-9, 1970, Davis, California, Paper No 4, 1970. 10 p, 6 fig, 1 tab, 7 ref.

Descriptors: *Sediment yield, *Mississippi River, *Mississippi River Basin, Sediment load, Provenance, Geomorphology, Sedimentation rates, Erosion.
Identifiers: *Upper Mississippi River Basin.

The Upper Mississippi River Basin drains an area of 18,000 square miles. The drainage system includes portions of seven states in north-central United States. The basin is relatively low-lying and gently to moderately rolling in character. This is the largest and most productive agricultural area in the United States. Sediment yield rates vary considerably throughout the basin. Generally the sediment yield is approximately 200 to 250 times greater in the extreme southern portion of the basin in comparison with the yields in the extreme northern part of the basin. As the size of the drainage area increases, the rate of sediment production per square mile decreases. This is the result of several factors. The chances that an intense storm will occur over the entire watershed become less and less as the watershed becomes larger. There is more variation in the rate of sediment production in smaller watersheds due to the fact that all physical factors vary more widely. The percentage of area of steep surface slopes with correspondingly high erosion rates decreases with the larger drainage area, which would tend to decrease the sediment yield per square mile of the larger basins. SEDIMENT PROBLEMS IN ST. LOUIS HARBOR,
Corps of Engineers, Vicksburg, Miss. Hydraulic and Reservoir Regulation Section.
James R. Tuttle.
In: Proceedings of a Seminar on Sediment Transport in Rivers and Reservoirs, Corps of Engineers Hydrologic Engineering Center, April 7-9, 1970, Davis, California, Paper No 7, 1970. 15 p, 4 fig, 3 tab, 4 ref, 2 map.

Descriptors: *Mississippi River, *Missouri River, *Sediment load, *Silting, *Harbors, Sedimentation, Deposition (Sediments), Hydraulic models, Model studies, Shallow water, Navigation.
Identifiers: *St. Louis Harbor.

The problem of inadequate depths at docks within the St. Louis Harbor apparently occurs infrequently but is quite troublesome. During high flow years bed-material samples indicate median diameters ranging from 0.6 to 1.1 mm as compared to median diameters of about 0.3 mm during years of low flow. Sand rating curves developed at Hermann and St. Louis indicate that the Mississippi River at St. Louis is not capable of carrying the sand load delivered by the Missouri River. The respective annual ratings are 30 million tons at Hermann and 22 million tons at St. Louis. Data are not available in sufficient detail to make reasonable numerical analyses; therefore, a model study is being conducted by the Waterways Experiment Station on the St. Louis Harbor. W71-06678

THE QUANTITY AND QUALITY OF SEDIMENTS DEPOSITED IN CLEVELAND HARBOR AT CLEVELAND, OHIO,
Corps of Engineers, Chicago, Ill.
David L. Sveum.
In: Proceedings of a Seminar on Sediment Transport in Rivers and Reservoirs, Corps of Engineers Hydrologic Engineering Center, April 7-9, 1970, Davis, California, Paper No 8, 1970. 16 p, 5 plate, 6 tab, 8 ref.

Descriptors: *Sedimentation, *Silting, *Water pollution sources, *Lake Erie, *Ohio, Harbors, Provenance, Sediments, Sediment load, Water pollution effects, Dredging, Waste disposal, Landfills.
Identifiers: Cleveland Harbor.

Erosion of the Cuyahoga River valley and its tributaries bring large quantities of sediment to the main stream, which are carried into Cleveland harbor. Erosion of areas disturbed by construction also produces sediment. Considerable quantities of municipal wastes, flue dust and other forms of industrial waste are deposited in the harbor. All of the materials which are deposited in the navigation channel must be removed by maintenance dredging. The materials so removed are considered to be grossly polluted, and continuation of the historical practice of disposing thereof by pumping in deep waters of Lake Erie, is considered to be inimical to the ecology of the lake. The average annual volume of the sediment inflow to Cleveland Harbor is about 1,242,000 cubic yards. The cheapest effective method of disposal, as an alternate to open lake disposal, is the use of diked containment areas near navigation projects. Disposal by loading the material from the settling basin into trucks for transportation to landfill sites appears to have merit for this location and is being given further consideration. A pilot program included construction of pilot scale diked disposal areas at a few locations. (See also W71-06675) (Knapp-USGS)

THE ROLE SEDIMENTS PLAY IN DETERMINING THE QUALITY OF WATER,
Corps of Engineers, Omaha, Nebr. Hydro-Sediment Section.
Robert H. Livesey.
In: Proceedings of a Seminar on Sediment Transport in Rivers and Reservoirs, Corps of Engineers Hydrologic Engineering Center, April 7-9, 1970, Davis, California, Paper No 9, 1970. 7 p, 1 plate.

Descriptors: *Sedimentation, *Water pollution effects, *Water pollution control, *Reviews, Sediment transport, Path of pollutants, Eutrophication.
Identifiers: *Sedimentation-water quality relations.

Sediment-related pollution problems are reviewed by discussing some examples. In the waste assimilation capability of both suspended and streambed sediment, exchange processes play the key role, assisted by hydraulic conditions. Sedimentation affects the biological environment by changing the ability of the aquatic community to function adequately and vigorously. Sedimentation plays an important role in the eutrophication processes of lakes and reservoirs. Turbidity influences the depth of the photosynthetic region. Pollutants attached to sediment particles are not dispersed or transported as rapidly as dissolved pollutants; large concentrations may build up in bed deposits awaiting a significant change in water chemistry to release the concentration into solution, or such concentrations can be removed from the water environment by burial in delta deposits. W71-06680

THE INTERRELATIONSHIP BETWEEN WATER TEMPERATURE, BED CONFIGURATION, AND SEDIMENT CHARACTERISTICS IN THE MISSOURI RIVER,
Army Corps of Engineers, Omaha, Nebr.
Warren J. Mellema.
In: Proceedings of a Seminar on Sediment Transport in Rivers and Reservoirs, Corps of Engineers Hydrologic Engineering Center, April 7-9, 1970, Davis, California, Paper No 10, 1970. 7 p, 7 ref.

Descriptors: *Missouri River, *Sediment transport, *Suspended load, *Water temperature, *Viscosity, Turbidity, Deposition (Sediments), Stage-discharge relations, Discharge (Water), Suspension, Sedimentation.
Identifiers: Water temperature-sedimentation relations.

Research directed toward the development of prediction equations for the determination of sediment discharge in sand bed streams is reviewed. Most of the developments to date involve examination of results of detailed flume or laboratory investigations. Measurements obtained on streams where the discharge is held constant tend to dampen out many of the normal fluctuations found in most natural streams. Selected reaches of the Missouri River fit into this category, and field investigations are made on one of these reaches. A downward shift is observed in the stage-discharge relationship of about 1-1 1/2 to 2 feet in the fall months with little or no variation in discharge. Closely associated with this shift is a lower water temperature. A decrease in temperature increases viscosity and decreases particle fall velocity. If a sufficient number of particles in certain critical size ranges are available in the stream bed, a dramatic change in the total sediment load of the stream can occur. The presence of more fine sediment in the flow tends to further decrease the fall velocity of the coarser suspended particles. A major change in the water temperature can therefore have a very significant influence on a stream's ability to transport material in suspension. (See also W71-06675) (Knapp-USGS)
W71-06681

SEDIMENTATION STUDIES FOR ROBERT S. KERR LOCK AND DAM, ARKANSAS RIVER BASIN,
Corps of Engineers, Davis, Calif. Hydrologic Engineering Center.
Howard O. Reese.
In: Proceedings of a Seminar on Sediment Transport in Rivers and Reservoirs, Corps of Engineers Hydrologic Engineering Center, April 7-9, 1970, Davis, California, Paper No 12, 1970. 14 p, 5 tab, 4 ref, 6 plate.

Descriptors: *Hydraulic models, *River training, *Stream stabilization, *Sediment control, Channel improvement, Sedimentation, Sediment transport, Dam construction, Model studies.
Identifiers: *Sedimentation models.

The solution of major sedimentation problems played an important role in the planning, design, and construction of the Arkansas River multiple-purpose project. Investigations included the determination of natural and modified sediment loads, sediment deposits in channels and reservoirs and degradation below dams, and the prediction of modified channel regime. Sedimentation studies conducted for one individual reservoir project, Robert S. Kerr Lock and Dam, of the Arkansas River multiple-purpose project are reviewed. The presence of coarse gravel in the bed hinders the rate of degradation, and in certain areas coarse gravel combined with the relatively nonmoving very coarse gravel should armor the bed. In those areas where a gravel control or armoring might occur, selective dredging may be necessary to expose the bed to flow which can cause an increase in the rate of degradation. This may have to be repeated several times to lower the bed to desired levels that would correspond with the 50-year weighted tailwater rating curve. It is not anticipated that major dredging should be necessary to lower the tailwater rating curve to the design level. (See also W71-06675) (Knapp-USGS)

THE KANSAS CITY DISTRICT SUSPENDED SEDIMENT LOAD COMPUTER PROGRAM,
Corps of Engineers, Kansas City, Mo.
Charles H. Sullivan.
In: Proceedings of a Seminar on Sediment Transport in Rivers and Reservoirs, Corps of Engineers Hydrologic Engineering Center, April 7-9, 1970, Davis, California, Paper No 14, 1970. 6 p, 9 fig, 2 tab.

Descriptors: *Computer programs, *Sediment discharge, *Data processing, Data collections, Hydrologic data, Sediment yield, Sedimentation, Discharge (Water), Suspended load, Sampling.
Identifiers: *Suspended load computation.

A computer program was developed for computing daily suspended sediment loads. Lacking the intuition of the trained engineer, the computer results were found to be poor if daily average discharges were used. It was determined that much better accuracy could be developed by use of bihourly discharges. This suspended sediment program is operable and being used on a 301 RCA computer. The results available are within the reasonable range of accuracy. As additional stations are computed, possible additional analysis can be made for a predicting type of program. The operating time for computing stations for one year is 20 minutes. Normally, daily, monthly, and yearly suspended sediment loads are printed out. Bihourly load printout can be made when a specified c.f.s. value is exceeded during the day. This program is coded in Fortran II and can be obtained from the Kansas City District Office, Corps of Engineers. (See also W71-06675) (Knapp-USGS)

CURRENT DUTCH PRACTICE FOR EVALUATING RIVER SEDIMENT TRANSPORT PROCESSES,
Corps of Engineers, St. Paul, Minn. Reservoir and Hydrologic Engineering Section.
Helmer O. Johnson.
In: Proceedings of a Seminar on Sediment Transport in Rivers and Reservoirs, Corps of Engineers Hydrologic Engineering Center, April 7-9, 1970, Davis, California, Paper No 15, 1970. 11 p, 5 fig, 6 ref, 2 append.

Descriptors: *Sediment transport, *Sedimentation, *Reviews, *Scour, Discharge (Water), Suspended load, Bed load, Surveys, Data processing, Channel morphology, River training.
Identifiers: *Dominant discharge.

Man-made intervention in natural river systems will result in changes of sediment transport, scour and deposition. Knowledge of the mechanism of sediment transport will give insight into the expected

results of artificial intervention and will decrease the chance of failure. This paper surveys the procedures relative to river processes and sediment transport which are currently being used in Europe and particularly in the Netherlands. The dominant discharge procedure enables engineers to determine the bed forming discharge of a river and also can serve as a guide in the design of river groynes (wing dams). Dutch engineers recommend that the height of groynes be governed by the dominant water level (dominant discharge) so as not to interfere with flood discharges. (See also W71-06675) (Knapp-USGS)

DETERMINATION OF THE MANNING COEFFICIENT FROM MEASURED BED ROUGHNESS IN NATURAL CHANNELS,
Geological Survey, Washington, D.C.
J. T. Limerinos.
For sale by Superintendent of Documents, US Government Printing Office, Washington, DC. 20402, 35 cents. Geological Survey Water-Supply Paper 1898-B, 1970. 47 p, 9 fig, 5 tab, 27 ref.

Descriptors: *Sediments, *Streambeds, *Particle size, *Sediment distribution, *Mannings equation, Natural streams, Channel flow, Discharge coefficients, Roughness (Hydraulic), Mathematical studies, Streamflow, Flow measurement, Sediment transport, Alluvium, Alluvial channels, Hydraulics.
Identifiers: *Streambed roughness, Bed material.

This report presents the results of a study to test the hypothesis that basic values of the Manning roughness coefficient of stream channels may be related to (1) some characteristic size of the streambed particles and to (2) the distribution of particle size. Fifty current-meter measurements of discharge and appropriate field surveys were made at 11 sites on California streams for the purpose of computing the roughness coefficient by the Manning formula. The test sites were selected to give a wide range in average size of bed material, and the discharge measurements and surveys were made at such times as to provide data covering a suitable range in stream depth. The characteristic bed-particle sizes used in the analyses were the 16-, 50- and 84-percentiles sizes as obtained from a cumulative frequency distribution of the diameters of randomly sampled surficial bed material. Separate distributions were computed for the minimum and intermediate values of the three diameters of a particle. No significant difference in reliability was found between the results obtained using minimum diameters and those obtained using intermediate diameters. The relations best fitting the field data for this study were obtained by using either a characteristic particle diameter equal to the 84-percentile size or a diameter obtained by weighting three characteristic particle sizes. SLAMTRANSPORTUNDERSOKELSER I NORSKE BRE-ELVER 1969 (SEDIMENT TRANSPORT STUDIES AT SELECTED GLACIER STREAMS IN NORWAY 1969) (Norwegian),
Norwegian Water Resources and Electricity Board, Oslo.
G. Ostrem, T. Ziegler, and S. R. Ekman.
Norges Vassdrags-Og Elektrisitetsvesen Report 6/70, Vassdragsdirektoratet Hydrologisk Avdeling, September 1970. 68 p, 29 fig, 20 ref.

Descriptors: *Sediment transport, *Streams, *Glaciers, Streamflow, Geology, Meteorology, Sedimentation, Sediment load, Suspension, Bed load, Particle size, Melt water, Sampling, Methodology, Planning, Hydrologic data, Data collections, Water utilization, Hydroelectric power.
Identifiers: *Glacier streams (Norway), *Norway.

The sediment transport studies undertaken at Norwegian glacier streams is a joint venture between the Norwegian Water Resources and Electricity Board and the Department of Physical Geography at Stockholm University. The aim of the investigations is to gain knowledge about the magnitudes and variations of sediment transport in glacier streams including the study of deposition of such material. The data has an important bearing on the planning of the future hydro-electric projects utilizing glacier meltwater streams and also for studying glacier erosion which the transported sediments are a result of. In 1969 an attempt was made to determine the bed load transport from Nigardsbreen by trapping all the coarse material in a constructed steel-net. A description of this experiment is given. Water samples were collected 2-5 times daily at one or more observation sites along the glacier streams during a field period. During flood conditions samples were taken hourly. A synopsis of the results from the investigations in 1969 are presented together with the results of studies from previous years. The table demonstrates clearly the variations in the volumes of transported sediments that exist between the individual glaciers and fluctuations in the volumes of transport for one and the same glacier from year to year are revealed. RIVER-COAST INTERACTION: LABORATORY SIMULATION,
Florida Univ., Gainesville. Dept. of Coastal and Oceanographic Engineering.
Omar H. Shemdin.
ASCE Proceedings, Journal of the Waterways, Harbors and Coastal Engineering Division, Vol 96, No WW 4, p 755-766, November 1970. 12 p, 11 fig, 2 ref, append.

Descriptors: *Hydraulic models, *Sedimentation, *Sand bars, *Backwater, Coastal engineering, Deposition (Sediments), Water levels, Sedimentary structures, Erosion, Floods, Hydraulic similitude, Shoals.
Identifiers: *River coast interactions.

The flow of a river into the ocean is often obstructed by a sand bar at the river mouth. The interaction of a river with the coast can be simulated in a hydraulic model with a movable bed. Use was made of the equation of continuity of sediment flow to arrive at similarity relationships. The method was used successfully for the Yaquez River in Puerto Rico. Water surface elevation in the river rises because of the obstruction of the bar at the river mouth. The highest water elevation occurs before the peak flow arrives at the mouth. Coastal structures were tested to minimize the water elevation. The method offers a useful coastal engineering tool but work is needed to include the influence of waves. (Knapp-USGS)

BULK DENSITY OF SEDIMENTS IN RIVER RESERVOIRS,
V. Miloradov.
Transactions Institute for Development of Water Resources, 'Jaroslav Cerni,' Vol 14, No 45, p 5-12, 1969. 8 p, 4 fig, 3 tab, 8 ref.

Descriptors: *Bulk density, *Sedimentation, *Reservoir silting, Sediment yield, Silts, Sediment transport, Reviews, Sampling, Surveys.
Identifiers: *Yugoslavia, *Danube River.

For forecasting sedimentation in newly designed reservoirs, equations are given in terms of the bulk density of sediment. However, bulk density cannot be measured on sediments from the river for which the reservoir is designed because they usually do not correspond to the sediments that will be deposited once the reservoir is constructed. To assess some criteria for the choice of bulk density in calculations for the Derdap Power Plant on the Danube, data from the literature was reviewed and new data were collected in Yugoslav rivers and reservoirs. NOTES ON SEDIMENTATION ACTIVITIES, CALENDAR YEAR 1969.
Bureau of Reclamation, Washington, D.C.

Water Resources Council, Sedimentation Committee Annual Report, 1970. 207 p, 1 fig, 4 tab, append.

Descriptors: *Sedimentation, *Documentation, *Publications, *United States, Programs, Projects, Bibliographies, Sediment transport, Streams, Reservoirs, Lakes, Sediment yield, Sedimentation rates, Particle size, Erosion, Sedimentology.
Identifiers: *Sedimentation activities (USA), Suspended sediment.

This report is a digest of information furnished by all Federal agencies conducting sedimentation investigations on work in progress or planned, important findings, new methods, new publications, laboratory and other research activities, and other pertinent information. The material has been organized by major drainage regions in the conterminous United States, Alaska, Hawaii, Puerto Rico, and Okinawa. Other major headings include Foreign Acitivities and Laboratory and Other Research Activities. An excerpt from the Catalog of Information on Water Data, Index to Water Quality Stations, 1970 edition, compiled by the Geological Survey, Office of Water Data Coordination, is included as Appendix A. This excerpt is a list, as of January 1970, of long-term water quality sites at which sediment data have been collected. Appendix B is a listing of agency addresses by departments where additional information on agency activities can be obtained. (Woodard-USGS)

CONTINENTAL SHELF AND UPPER SLOPE SEDIMENTS OFF PORTUGESE GUINEA, GUINEA, AND SIERRA LEONE, WEST AFRICA,
Rhode Island Univ., Kingston. Graduate School of Oceanography; and Woods Hole Oceanographic Institution, Mass.
Robert L. McMaster, John D. Milliman, and Asaf Ashraf.
Journal of Sedimentary Petrology, Vol 41, No 1, March 1971, p 150-158. 9 p, 5 fig, 20 ref. ONR Contract N00014-68-A-0215-0003.

Descriptors: *Bottom sediments, *Provenance, *Continental shelf, *Continental slope, *Sedimentation, Stratigraphy, Deposition (Sediments), Sediment transport, Waves (Water), Tides, Tidal effects, Deltas.
Identifiers: *Africa.

Sediments on the continental shelf off Portuguese Guinea, Guinea, and Sierra Leone are mainly terrigenous, and have been stream derived. Except for

a lobe of terrigenous material extending seaward from the Orango Delta, most sediments on the outer shelf and upper slope are rich in shallow-water biogenic carbonate and weathered glauconite, suggesting severe restriction in the offshore transport of detrital sediments, both at present and during the last low stand of sea level. In general the surface sediments are medium to fine sands, moderately to moderately well sorted and negatively skewed. For the most part these sands accumulated during the Pleistocene. However, the Holocene transgression and accompanying environmental processes have modified these sediments so that distinctive grain size parameters that characterized their original depositional environments can no longer be detected. Silts and clays on the Bissagos Delta front, derived from the Cacheo and Geba Rivers and probably the Casamance River, are the only sediments presently accumulating on the middle or outer shelf in this area. Coastal and tidal currents may have moved some of this sediment toward the south, where it has been funneled locally into the deep sea. (Knapp-USGS)
W71-06988

PALEOFLOW CHARACTERISTICS OF A LATE CRETACEOUS RIVER IN UTAH FROM ANALYSIS OF SEDIMENTARY STRUCTURES IN THE FERRON SANDSTONE,
Bucknell Univ., Lewisburg, Pa. Dept. of Geology and Geography.
Edward Cotter.
Journal of Sedimentary Petrology, Vol 41, No 1, p 129-138, March 1971. 10 p, 5 fig, 46 ref.

Descriptors: *Paleohydrology, *Alluvial channels, *Sedimentary structures, *Stratigraphy, Bed load, Suspended load, Sand waves, Dunes, Streamflow, Mannings equation, Sandstones, Petrofabrics, Utah.
Identifiers: Ferron sandstone (Utah).

Interpretation of sedimentary sturctures and detailed stratigraphic relations of the fluvial facies of the Upper Cretaceous Ferron Sandstone in the Castle Valley in east-central Utah permits reasonable reconstruction of many parameters of a Late Cretaceous alluvial system. The width and depth of flow of the ancient Ferron River were estimated from the geometry of preserved sedimentary structures, and the type of sediment transported by the river was determined by studying the sandstone texture. Various relationships of modern streams empirically derived by Schumm are used to estimate channel sinuosity, meander length, mean annual discharge, mean annual flood, channel slope, and flow velocity. Values derived for the slope and velocity are supported by other indirect methods based on the Manning equation. It appears likely that the Late Cretaceous Ferron River was about 300 feet wide and 25 feet deep, and that it was highly sinuous, with meander lengths of 2,500 to 4,100 feet. As the 200-mile-long river drained an area to the southwest of 6,000 to 8,000 square miles, it had a mean annual discharge of approximately 6,000 to 7,000 cubic feet per second and a mean annual flood of about 22,000 cfs. Although only 2 percent of the total river load was bedload, the flow velocity of between 2.0 and 4.6 feet per second in the upper part of the lower flow regime caused the fine- to medium-grained sand to be in a dune bed configuration. (Knapp-USGS)
W71-06989

WAVE EFFECTIVENESS AT THE SEA BED AND ITS RELATIONSHIP TO BED-FORMS AND DEPOSITION OF MUD,
University of East Anglia, Norwich (England). School of Environmental Sciences.
I. N. McCave.
Journal of Sedimentary Petrology, Vol 41, No 1, p 89-96, March 1971. 8 p, 7 fig, 1 tab, 25 ref.

Descriptors: *Waves (Water), *Bottom sediments, *Sediment transport, *Suspended load, *Muds, Sedimentation, Turbulence, Currents (Water).
Identifiers: *Wave effectiveness, North Sea.

A wave effectiveness parameter is defined as the product of theoretical instantaneous sediment transport rate times frequency, for wave action at the sea bed. High values of this parameter are found in waters shallower than 18 m. in the southern North Sea and are related to absence of sand waves at these depths. Mud deposition occurs in certain shallow areas of the southern North Sea where the concentration of suspended sediment is high. Farther offshore, where suspended sediment concentration is low and wave activity moderate no mud deposits are found. With increasing depth, more mud is found in the bottom sediment. In the Celtic Sea the wave effectiveness parameter has the same value at 73 m. as it does in the North Sea at 30 m. This is close to the sand/mud boundary in the bottom sediments of both areas. Wave activity is only one factor--others being suspended sediment concentration and cirrent velocity--influencing deposition of mud. Some ancient mudstone could have been deposited in shallow waters off exposed coasts. (Knapp-USGS)
W71-06990

PSEUDO-PLANAR STRATIFICATION PRODUCED BY VERY LOW AMPLITUDE SAND WAVES,
Illinois Univ., Chicago.
Norman D. Smith.
Journal of Sedimentary Petrology, Vol 41, No 1, p 69-73, March 1971. 5 p, 6 fig, 19 ref.

Descriptors: *Sedimentary structures, *Sand waves, Ripple marks, Stratigraphy, Alluvial channels, Bed load, Sediment transport, Dunes.
Identifiers: Platte River (Nebr).

Thin sand sheets with downstream foresets form in very shallow depths in the Platte River and resemble small sand waves. They produce internal horizontal stratification which is superficially similar to upper flow regime plane bed deposits except that the grains are differentiated into alternating coarse and fine laminations by sorting processes at the foreset. A 12-inch bed of horizontal laminae exposed in a river bank formed by accretion of low amplitude sand waves on a floodplain during slowly increasing flood stages. (Knapp-USGS)

QUARTZ GRAIN ORIENTATIONS -- 1 (THE PHOTOMETRIC METHOD),
Mobil Research and Development Corp., Dallas, Tex. Field Research Lab.
R. F. Sippel.
Journal of Sedimentary Petrology, Vol 41, No 1, p 38-59, March 1971. 22 p, 23 fig, 1 tab, 15 ref.

Descriptors: *Sedimentary petrology, *Microscopy, *Sedimentary structures, *Petrofabrics, *Sandstones, Particle shape, Particle size, Petrology, Sedimentary rocks, Petrography.
Identifiers: *Particle orientation (Sediments).

Among several rapid methods which have been suggested for measuring sandstone grain orientation, the photometric method has much to recommend it. Crystallographic methods are applicable except in very rare instances, and have unique advantages compared to the particulate methods. This paper employs the Jones Calculus, a powerful method for polarized light calculations. With its help a quantitative theory of the photometer is presented. An optimum form of the photometer is derived and compared with the form originally suggested. Photometer action is simulated in the computer, and the instrument is tested for ability to analyze assumed three-dimensional distributions of quartz grain c axes. Effect of porosity, thin section thickness, inclination of the preferred direction, and strength of preferred orientation are all evaluated for each instrument. (Knapp-USGS)
W71-06992

MEASUREMENT OF C INTERCEPTS IN LOOSE SAND GRAINS BY OPTICAL HEIGHT,
Idaho State Univ., Pocatello.
William B. Wadsworth.
Journal of Sedimentary Petrology, Vol 41, No 1, p 30-37, March 1971. 8 p, 5 fig, 1 tab, 25 ref.

Descriptors: *Particle shape, *Microscopy, *Measurement, Sedimentology, Shape, Analytical techniques, Particle size, Statistics, Statistical methods, Variability.
Identifiers: *Particle shape determination.

A procedure for directly measuring the shortest axis of an individual particle by focusing a microscope successively on its mounting surface and then on its highest point is found to be feasible. This distance, as read from a calibrated fine-focus drum, is both highly accurate and sufficiently precise for most purposes, though an easily determined correction factor may be required for built-in bias of the focus calibration. Comparison of 200 optical height measurements on 40 grains with paired observations derived by eyepiece micrometer demonstrates an identity of mean values. Optical height data are nearly three times less precise; nevertheless, roughly 170 of 200 observations occur within six percent of their group mean values throughout the sand size range. After initial calibration of the microscope, no preparatory stages in grain mounting or equipment manufacture are required; the routine petrographic microscope and accessories are sufficient for optical height determinations. The result is a procedure which permits essentially simultaneous measurement of all three principal grain diameters, giving immediate access to three-dimensional grain size and shape information and the advantage of direct measurement. (Knapp-USGS)
W71-06994

THE RELATIONSHIP BETWEEN SPHERE SIZE AND SETTLING VELOCITY,
Northwestern Univ., Evanston, Ill. Dept. of Geological Sciences.
Ronald J. Gibbs, Martin D. Mathews, and David A. Link.
Journal of Sedimentary Petrology, Vol 41, No 1, p 7-18, March 1971. 12 p, 1 fig, 6 tab, 18 ref.

Descriptors: *Sedimentation, *Settling velocity, *Particle size, Viscosity, Sediment transport, Deposition (Sediments), Instrumentation, Equations, Laboratory tests, Stokes law, Density.
Identifiers: *Settling tubes.

The settling velocities in water of 216 glass spheres ranging in size from 50 to 5000 microns in diameter were determined. The size, density, and shape of these spheres were accurately known. All timing precisions were better than 1/2% and the combined precision (size, shape, density, timing, etc) of the velocity measurements was less than 2% at a 95% confidence level. Based on this data an empirical equation was derived to give the relationship between sphere size and settling velocity. The range of usefulness of the equation includes spheres from 0.1 micron to 6 mm diameter and, with correction factors, is extended to 50 mm spheres. Tables are presented relating various sphere diameters, water temperatures, sphere densities, and fluid salinities. The equation may be used as a basis of standardization of settling tube data and as a basis for determining the sedimentation diameter. (Knapp-USGS)
W71-06995

CASE-HARDENING OF CARBONATE ALLUVIUM AND COLLUVIUM, SPRING MOUNTAINS, NEVADA,
Pennsylvania State Univ., University Park. Dept. of Geology and Geophysics.
Laurence H. Lattman, and Elliott M. Simonberg.
Journal of Sedimentary Petrology, Vol 41, No 1, p 274-281, Mar 1971. 8 p, 9 fig, 2 ref. AF Cambridge Lab. Contract No F 19628-68-C-0136.

Descriptors: *Alluvium, *Water chemistry, *Diagenesis, *Seepage, *Leaching, Calcite, Calcium carbonate, Limestones, Recharge, Groundwater movement, Nevada, Chemical precipitation, Caliche.
Identifiers: Spring Mountains (Nevada).

Case-hardening of vertical faces of alluvium and colluvium in, and flanking, the Spring Mountains, Nevada, begins within one or two years after exposure and may proceed to the extent that samples break through clasts. The alluvium and colluvium consist primarily of carbonates, and the cementation which causes the case-hardening appears to be due to solution of the sand-sized and finer carbonate fractions and subsequent deposition of calcite. Above present drainage channels the case-hardening seems to be caused by surface runoff, and the rapidity and degree of cementation is controlled by the texture of layers and lenses within the colluvium and alluvium. Along the present drainage, the case-hardening appears to be due to influent seepage from the streams during spring runoff or during infrequent summer showers and is little affected by texture. LIFT FORCES ON SUSPENDED SEDIMENT PARTICLES IN LAMINAR FLOW: EXPERIMENTS AND SEDIMENTOLOGICAL INTERPRETATION,
Massachusetts Inst. of Tech., Cambridge.
John B. Southard.
Journal of Sedimentary Petrology, Vol 41, No 1, p 320-324, March 1971. 5 p, 1 fig, 6 ref. ONR Contract Nonr 1841 (74)-NR083-157.

Descriptors: *Sediment transport, *Laminar flow, *Bed load, *Tractive forces, Flow, Sedimentation, Alluvial channels.
Identifiers: Lift forces (Sedimentation).

A sphere carried by laminar flow past a planar boundary is affected by a force away from the boundary. The sedimentological implications of this effect, both for transportation of coarse sediment in strong turbulent flows and for deposition of fine sediments from oceanic bottom currents, were explored by estimating the lift force on small, nearly neutrally buoyant spheres suspended in laminar flow in a laboratory flume and evaluating how closely this models the lift force in the natural flows. This lift-force effect is probably not important in natural sedimentary processes. (Knapp-USGS)
W71-06998

A TEST OF VALIDITY OF QUARTZ GRAIN ORIENTATION AS A PALEOCURRENT AND PALEOENVIRONMENTAL INDICATOR,
Guelph Univ. (Ontario). Dept. of Soil Science.
I. P. Martini.
Journal of Sedimentary Petrology, Vol 41, No 1, p 60-68, March 1971. 9 p, 6 fig, 2 tab, 20 ref.

Descriptors: *Sedimentary structures, *Paleohydrology, *Sedimentation, *Petrofabrics, *Microscopy, Sandstones, Particle shape, Particle size, Petrology, Sedimentary rocks, Petrography.
Identifiers: *Particle orientation (Sediments).

Analysis of quartz grain orientation in a set of 261 thin sections obtained from the Thorold and Grimsby Sandstone (Silurian, S.W. Ontario and New York State) indicates that: (1) The number of measurements needed for a petrographic analysis of grain orientation varies from 50-100 in thin sections cut perpendicular to the depositional surface, to 150-250 in thin sections cut parallel to the depositional surface; (2) preferred grain imbrications are encountered in the vast majority of the samples examined. Vertical thin sections cut parallel to the vector mean of the H-grain orientation show a tendency to have an average imbrication value significantly different from zero, hence usable for paleocurrent determinations. Grain orientation distributions are useful in sedimentological paleoenvironmental reconstructions. The grain imbrication populations measured in apparently massive beds are a mixture of grain imbrications and of H-grain orientations. The vector means of the h-grain orientation of the massive beds can be utilized as valid line of movement data. (Knapp-USGS)

MIXING AT TURBIDITY CURRENT HEADS, AND ITS GEOLOGICAL IMPLICATIONS,
Reading Univ. (England). Sedimentology Research Lab.
J. R. L. Allen.
Journal of Sedimentary Petrology, Vol 41, No 1, p 97-113, March 1971. 17 p, 8 fig, 1 tab, 35 ref.

Descriptors: *Sediment transport, *Mixing, *Turbidity currents, *Sedimentary structures, Bottom sediments, Bed load, Suspended load, Mathematical studies, Variability, Turbidity, Turbulence, Turbulent flow, Density currents, Continental slope.
Identifiers: Gravity currents.

The shape of the head of a turbidity current is consistent with an inflow of the ambient medium into the current along clefts and tunnels regularly spaced along and back from the overhanging front of the head. When the rate of inflow of the ambient medium into the head is expressed mathematically, it is shown that the bed shear stresses exerted in the region of the head vary transversely across the region with a spatial periodicity. The deduced force structure of the head region explains the occurrence on turbidite soles of regular bands or clusters of flute marks aligned parallel with flow. The near-bed flow in the head is strongly three-dimensional, and this may explain the commonly observed non-parallelism of the sole markings observed on single bedding surfaces. The rates of inflow of the ambient medium into the head are found to be large enough to account for the density reduction necessary for the transformation of a liquified sediment slump into a turbidity current in a journey down the continental slope and upper rise. PARTICLE SHAPE: CLASSIFICATION OF THICKNESS USING SLOTTED SCREENS,
Gulf Research and Development Co., Pittsburgh, Pa.
John C. Ludwick.
Journal of Sedimentary Petrology, Vol 41, No 1, p 19-29, March 1971. 11 p, 5 fig, 4 tab, 23 ref.

Descriptors: *Particle shape, *Sieve analysis, *Sieves, Shape, Analytical techniques, Separation techniques, Measurement, Particle size, Settling velocity.
Identifiers: *Particle shape determination.

A shape classification of sand particles according to thickness is obtained by sieving a sediment sample through a nest of several screens with slotted openings, the widths of which are smaller in each subjacent screen. The sample is first sieved through a pair of round-holed screens, the openings of which are nearly the same. This produces a subsample narrowly limited in particle size. The shape distribution in the sediment fraction obtained through use of the round-holed screens is unbiased. The distributions of particle thickness in the individual slotted screen fractions are bell-shaped, skewed depending on location relative to the modal class, and overlapping to a predictable degree. In using the method, slotted screen fraction weights are converted to number of particles per fraction. These particles are distributed keeping the areas under the individual distributions proportional to the corresponding number of particles. The numbers of particles per standard class interval of particle thickness are summed over the different distributions to yield the desired distribution of relative particle thickness for the sample. AREAL SORTING OF BED-LOAD MATERIAL: THE HYPOTHESIS OF VELOCITY REVERSAL,
Purdue Univ., Lafayette, Ind. Dept. of Geosciences.
Edward A. Keller.
Geological Society of America Bulletin, Vol 82, No 3, p 753-756, March 1971. 4 p, 1 fig, 5 ref.

Descriptors: *Sediment transport, *Bed load, *Alluvial channels, *Particle size, *Channel morphology, Sedimentation, Bottom sediments, Deposition (Sediments), Streamflow, State-discharge relations, Current meters, California, Velocity.
Identifiers: *Sorting (Sedimentation).

The hypothesis of velocity reversal seems adequate to explain the areal sorting of channel material, that is, relatively large material in riffles and finer material in pools. The hypothesis is based primarily on the observation that with increasing discharge the average bottom velocity of a pool increases faster than that of a riffle until at relatively high flow the average bottom velocity of the pool exceeds that of a riffle. The areal sorting produced by the velocity reversal occurs at flows of moderate frequency. (Knapp-USGS)

GEOMORPHOLOGY OF THE FILDES PENINSULA ON KING GEORGE (WATERLOO) ISLAND,
USSR Arctic and Antarctic Scientific Research Inst., Leningrad, Dept. of Geographical Sciences.
V. V. Zamoruyev.
Translated from Informatsionnyi Byulleten' Sovetskoi Antarticheskoi Ekspeditsii, No 71, p 36, 1968. Soviet Antarctic Expedition Information Bulletin, Vol 7, No 3, p 197-198, January 1971. 2 p, 2 ref.

Descriptors: *Geomorphology, *Antarctic, Erosion, Topography, Lakes, Streams, Infiltration, Scour, Glaciers, Solifluction, Mass wasting, Polar regions, Cold regions.
Identifiers: *Fildes Peninsula (Antarctica), *Antarctica.

The Fildes Peninsula is the southwestern tip of Waterloo Island in the South Shetland Island group. The peninsula extends 10 km from the southwest to the northeast and is 2.5-3 km wide. The coastline is dissected by numerous inlets and capes, the most important of which is Ardley Peninsula on the east coast. Most of Fildes Peninsula is free of ice and it does not differ essentially from the 'oases' on the Antarctic continent. The edge of the ice dome, covering Waterloo Island, crosses the northern part of Fildes Peninsula. The ice-free part of Fildes Peninsula is hilly with absolute elevations of up to 150 m. The configurations of large relief forms are probably determined by fractures and tectonically weakened zones. Small lakes, found in the depressions between hills, total 13. The largest of these measures 500 x 250 m. According to preliminary data, the depth of many lakes is at least 5-7 m. The present leading relief-forming processes are physical weathering and solifluction. The drainage network is poorly developed. Because of slow and irregular snow melting and the nature of the loose deposits, most of the water does not form streams, but saturates the accumulations of weathering products and promotes the development of solifluction. The existing streamlets are small and their channels are entrenched only several tens of centimeters. They frequently lack a permanent channel and develop in the form of many small rivulets flowing along the

foot of the solifluction trains. Sometimes, the small streams disappear in the solifluction deposits. Traces of a sea level higher than that now existing occur in many coastal areas. (Knapp-USGS)

CONTINENTAL SABKHA IN ARAVA VALLEY BETWEEN DEAD SEA AND RED SEA: SIGNIFICANCE FOR ORIGIN OF EVAPORITES,
Rensselaer Polytechnic Inst., Troy, N.Y. Dept. of Geology.
Abraham J. Amiel, and Gerald M. Friedman.
The American Association of Petroleum Geologists Bulletin, Vol 55, No 4, p 581-592, April 1971. 12 p, 12 fig, 3 tab, 35 ref.

Descriptors: *Sedimentation, *Deserts, *Salt marshes, *Saline lakes, *Water chemistry, Evaporation, Groundwater movement, Gypsum, Carbonates, Sulfates, Chemical precipitation, Salts, Chlorides, Stratigraphy, Alluvium, Seepage, Water table.
Identifiers: *Sinai Peninsula, *Sabkhas, *Evaporites.

The Yotvata Sabkha, a continental sabkha having an area of 45 sq km, fills the entire Arava Valley, in the Sinai Peninsula. The climate is one of the most arid in the world. Short, ephemeral streams (wadis), prevented by alluvial fans from reaching the Gulf of Aqaba, provide water that seeps into the soil, thus keeping the water table close to the surface. The capillary fringe above this water table is at the floor of the sabkha. Three distinct zones exist in the sabkha: (1) the central barren zone, (2) the transitional zone, and (3) the outer vegetated zone with halophytic vegetation. Depths to groundwater range from 90 cm in the central barren zone to more than 3 m in the outer vegetated zone. Chlorinity values in the groundwater are highest in the central barren zone (up to 20%) and decrease toward the transitional and outer vegetated zones (1%); a sharp drop occurs near the contact between the central barren zone and transitional zone. The sulfate concentration in the groundwater is greatest in the transitional zone and decreases both toward the central barren zone and the outer vegetated zone. The Mg/Ca ratio of the groundwater parallels the trend in the sulfate concentration. Gypsum is the principal authigenic mineral in the transitional and outer vegetated zones, whereas halite predominates in the central barren zone. (Knapp-USGS)

RECOGNITION OF BARRIER ENVIRONMENTS,
Missouri Univ., Columbia; and Southern Illinois Univ., Carbondale; and Texas A and M Univ., College Station. Dept. of Geology.
David K. Davies, Frank G. Ethridge, and Robert R. Berg.
The American Association of Petroleum Geologists Bulletin, Vol 55, No 4, p 550-565, April 1971. 16 p, 15 fig, 3 tab, 32 ref.

Descriptors: *Sedimentation, *Beaches, *Sand bars, *Dunes, *Sedimentary structures, Geomorphology, Waves (Water), Deposition (Sediments), Shoals, Coasts, Sands.
Identifiers: *Coastal barriers.

The vertical succession of sedimentary structures and textures at Galveston Barrier Island, Texas, is identical with vertical successions in two ancient barrier complexes, one in the lower Cretaceous of Montana and the other in the Lower Jurassic of England. Within both Holocene and ancient examples, there is a gradation upward from irregular interlaminations of siltstone and claystone at the base, through burrowed and generally structureless sandstone, to low-angle and microtrough cross-laminated sandstone, terminating (in two of the examples) in structureless and rooted sandstone. This sequence represents deposition in lower shoreface, middle shoreface, upper shoreface-beach, and eolian environments, respectively. Analyses of quartz size and content of the Holocene and ancient barriers yield textural and compositional parameters that are environmentally sensitive. Plots of these parameters demonstrate that each of the environments may be distinguished on the basis of thin-section analyses. Consequently, full diameter cores may not be necessary for precise environmental interpretation in the subsurface. (Knapp-USGS)

MEASUREMENT OF SHEAR STRESS AND ROUGHNESS LENGTH ON A BEACH,
Louisiana State Univ., Baton Rouge. Coastal Studies Inst.
Shih-Ang Hsu.
Journal of Geophysical Research, Vol 76, No 12, p 2880-2885, April 20, 1971. 6 p, 4 fig, 2 tab, 18 ref. ONR Contract N00014-69-A-0211-0003, NR 388 002.

Descriptors: *Beaches, *Dunes, *Roughness coefficient, *Shear drag, *Winds, Wind erosion, Aeolian soils, Wind pressure, Air-earth interfaces, Boundary processes, Flow resistance, Shear, Surfaces.
Identifiers: Roughness (Aerodynamic).

Measurements of surface shearing stress and aerodynamic roughness length on a beach were made by simultaneous temperature- and wind-profile methods in the following three areas of the beach slope on the Gulf of Mexico coast near Fort Walton Beach, Florida: the swash zone, the mid-foreshore, and the area near the berm scarp. Under adiabatic and onshore wind conditions, the swash zone is approximately 100 times smoother than the mid-foreshore and 500 times smoother than the area near the berm scarp; the shear stress is approximately 2.5 and 3.5 times larger at 10 m and 20 m fetch downwind, respectively, from the swash zone. A TIME SERIES FROM THE BEACH ENVIRONMENT - II,
Virginia Inst. of Marine Science, Gloucester Point.
W. Harrison, and L. E. Fausak.
Virginia Institute of Marine Science Data Report No 7, December 1970. 96 p, 4 fig, 1 tab, 15 ref, 6 append. ONR Contract Nonr-N00014-70-C-000A. ONR Task No NR 388-097.

Descriptors: *Beaches, *Environmental effects, *Time series analysis, *Coasts, *Virginia, Ocean waves, Marine geology, Water table, Elevation, Tides, Rainfall, Pressure, Water levels, Water wells, Oceans, Shores, Slopes, Mathematical studies, Hydrologic data, Data collections, Groundwater, Bedrock, Geomorphology, Erosion.
Identifiers: *Virginia Beach.

Beach variables were sampled during a 30-day period in August and September, 1969, at Virginia Beach, Virginia. The purpose was to investigate the water table of a marine beach and to clarify the interaction of the water table and several process variables of the beach-ocean-atmosphere system. This report describes the methods of measurement and tabulates the values obtained for the following variables: breaker height, breaker period, trough-to-bottom depth in front of a breaking wave, breaker steepness, breaker power, the limit of swash run-up, the outcrop of the water table on the foreshore, slope of the foreshore, water table elevation, beach elevation, barometric pressure, rainfall, and still-water level. FLORIDA BEACHES AND CEMENTED WATER-TABLE ROCKS,
Louisiana State Univ., Baton Rouge. Coastal Studies Inst.
Richard J. Russell.
Louisiana State University Coastal Studies Institute Technical Report 88, October 30, 1970. 53 p, 2 fig, 31 photo, 6 tab, 44 ref. ONR Contract N00014-69-A-0211-0003. Project NR 388 002.

Descriptors: *Diagnesis, *Chemical precipitation, *Marine geology, *Beaches, *Florida, Water tables, Rock properties, Cohesion, Atlantic Ocean, Gulf of Mexico, Coasts, Geology, Mineralogy, Stratigraphy.
Identifiers: *Beach rock cementation, *Florida Keys.

In October 1969 Florida beaches between Cedar Key and Dry Tortugas, on the coast of the Gulf of Mexico, and beaches along the Atlantic Ocean as far north as Anastasia Island (St. Augustine), were investigated in a reconnaissance study of composition and indications of cementation associated with their water tables. In all cases cementation was restricted to the zone of water-table fluctuation. There is excellent beach rock on Loggerhead Key (Dry Tortugas) and on Middle Cape (Cape Sable), good beach rock on East Cape (Cape Sable), and water-table rock on Grassy Key (east of Marathon). Other occurrences probably exist south of a line extending from the mouth of Shark River to the coast somewhat south of Homestead. Reported localities farther north on the Atlantic Coast, most of which are given in terms of generalizations, appear to be misidentifications resulting from confusion with outcrops of the Anastasia formation, many of which are in positions where beach rock might be suspected. TRITIUM LOSS FROM WATER EXPOSED TO THE ATMOSPHERE,
Du Pont de Nemours (E.I.) and Co., Aiken, S.C. Savannah River Lab.
J. Henry Horton, John C. Corey, and Richard M. Wallace.
Environmental Science and Technology, Vol 5, No 4, p 338-343, April 1971. 6 p, 10 fig, 1 tab, 7 ref.

Descriptors: *Tritium, *Evaporation, *Surface waters, *Atmosphere, Laboratory tests, Mathematical studies, Equations, Streamflow, Watersheds (Basins), Meteorology, Air-water interfaces.
Identifiers: *Tritium loss.

Equations describing the loss of tritium as HTO from water into air and the gain of HTO in water when the overlying water vapor contains tritium but the solution does not are developed and verified by laboratory experiments. Results show that under environmental conditions, where the relative humidity is greater than 8%, HTO is lost preferentially over H2O to the atmosphere because atmospheric moisture is virtually free of HTO. Results from a three-year study of the changes in tritium content of a large nonseeping outdoor basin are used to extend the laboratory studies to field situations. Data from this field study were used to calculate tritium loss from open basins. These calculations show that 90% of the tritium contained in an aqueous stream flowing at 15,000 liters per day will be lost to the atmosphere from a shallow basin with a surface area of 6000 square m. SUMMARY OF DATA ON CHEMICAL QUALITY OF STREAMS OF NORTH CAROLINA, 1943-1967,
Geological Survey, Washington, D.C.
Hugh B. Wilder, and Larry J. Slack.
Available from SOD, Washington, DC 20402 - $1.75. Geological Survey Water-Supply Paper 1895-B, 1971. 236 p, 2 plate, 6 tab.

Descriptors: *Water quality, *Chemical analysis, *Surface waters, *North Carolina, Streams, Reviews, Water chemistry, Sampling, Data collections, Water analysis.
Identifiers: *Water analyses compilation.

This report summarizes water-quality data collected by the U.S. Geological Survey in cooperation with the State of North Carolina during the period 1943-67. Maximum, minimum, and average values are shown for chemical analyses of mineral constituents dissolved in water from 177 locations at which samples were collected daily or monthly for at least 1 consecutive year. Maximum and minimum values are given for 460 'miscellaneous and occasional stations' at which two or more samples were collected. Also tabulated are analyses of samples from 580 sites at which only one sample for each site was collected. A total of about 19,000 analyses were used in determining statistical values included in the report. Water in streams of North Carolina is generally of good mineral quality and is acceptable with a minimum amount of treatment for most uses. (Woodard-USGS)

INTERSTITIAL WATER STUDIES ON SMALL CORE SAMPLES, LEG 4,
Woods Hole Oceanographic Institution, Mass.; Geological Survey, Woods Hole, Mass.; and California State Coll., Long Beach.
F. L. Sayles, F. T. Manheim, and K. M. Chan.
In: Initial Report of the Deep Sea Drilling Project, Vol 4, National Science Foundation, p 401-414, September 1970; Washington, DC, US Government Printing Office. 14 p, 4 tab, 14 ref.

Descriptors: *Diagenesis, *Water chemistry, *Sediments, *Cores, *Connate water, Sampling, Sedimentation, Data collections, Laboratory techniques, On-site tests, Salinity.
Identifiers: Interstitial water.

Reorganization and recodification of shipboard procedures used in the Deep Sea Drilling Project for collecting interstitial waters result in improved and more regular collection and analysis of pore fluids. Comparative studies of waters squeezed and analyzed on shipboard and analyzed in the shore laboratory show generally good agreement. Influences of pressure and temperature during squeezing on composition of effluents were studied in clayey sample cores. Pressure was not found to be significant, whereas the temperature effects are significant, but are less than variations attributable to diagenetic reactions in the sediments. Conservative constituents, such as, chloride, sodium and bromide, remain relatively constant (within about 1.5%) with changing depth in the holes; but, large depletions with respect to normal sea water occur in calcium, magnesium, potassium, and sulfate in most of the cores. On the other hand, large enrichments of calcium and lithium occurred in some holes. (Knapp-USGS)

A UNIQUE RESULT OF MOSSBAUER SPECTROSCOPY,
Technical Publishing Co., Barrington, Ill. Thompson Div.
F. W. Karasek.
Research/Development, Vol 22, No 3, p 18-20, 22, March 1971. 4 p, 6 fig, 1 photo, 4 ref.

Descriptors: *Water pollution control, *Synthesis, *Instrumentation, *Spectroscopy, Chemical degradation, Fertilizer, Nutrients, Water quality, Wastes, Pollutants, Water chemistry, Herbicides
Identifiers: *Water degradable products, *Polymers, *Mossbauer spectroscopy.

Over 100 important commercial compounds have been polymerized with metals such as iron, copper and calcium to form water-degradable products. This report describes the functions of Mossbauer spectroscopy concerning the chemical bonding and structures involved. The value of these polymers for increasing the effectiveness of agricultural chemicals and reducing environmental pollution appears considerable. Initial emphasis has been placed on herbicidal uses. Pollution of water supplies commonly accompanies the application of herbicides in useful concentrations. Rain or irrigation water washes away much of the herbicide; hence overapplication is required for effective control, with several applications a year needed. A 2,4-D-iron polymer with a single application of 1 pound/acre has effectively controlled weeds on grazing lands in Kansas for over one year. Other tests show effectiveness in aquatic herbicidal use. (Woodard-USGS)
W71-06672

THE EFFECT OF METEORIC WATER, MELT WATER AND BRINE ON THE COMPOSITION OF POLAR SEA WATER AND OF THE DEEP WATERS OF THE OCEAN,
Woods Hole Oceanographic Inst., Woods Hole, Mass; and Geological Survey, Washington, D.C.
Alfred C. Redfield, and Irving Friedman.
Deep-Sea Research, Supplement to Vol 16, p 197-214, Pergamon Press, 1969. 18 p, 11 fig, 3 tab, 17 ref.

Descriptors: *Salinity, *Sea water, *Deuterium, *Melt water, *Arctic Ocean, Glaciers, Arctic, Water properties, Mixing, Brines, Rain water.
Identifiers: *Baffin Bay.

The fresh water derived from melting sea ice may be distinguished from that derived from meteoric waters by its deuterium content. The apparent diluent of the Arctic Ocean waters has a deuterium content of about - 25% relative to Standard Mean Ocean Water, corresponding to the average composition of meteoric water, snow and glacial ice in the polar regions. The melt water from sea ice has very nearly the same deuterium content as the sea water from which it is frozen. In summer the subsurface layers of sea water in regions where ice is formed and melted seasonally differ very little in deuterium content although the salinity is reduced substantially by melt water. In confined straits and fiords the apparent diluent is derived about 3/4 from glacial ice and 1/4 from melting sea ice. It is estimated from deuterium-salinity relations that brine liberated in the freezing of sea ice increases the salinity of the subsurface water of Baffin Bay at 100 m by 0.36 parts per thousand and that of the water near the bottom of Kane Basin by 0.6 parts per thousand. The freezing of 2 meters of sea ice would be sufficient to liberate the quantity of salt required to produce these changes in salinity. Comparison of the deuterium and salinity concentrations in the deep water masses of the ocean with those of their presumed sources indicates that salt liberated as brine in the freezing of sea ice may increase the salinity by 0.02 to 0.16 parts per thousand over that which the deep water would have were it modified solely by dilution with polar meteoric water. The consequence of this effect in seeking the source of deep water is discussed. (Knapp-USGS)

Deep-Sea Research, Supplement to Vol 16, p 25-29, Pergamon Press, 1969. 5 p, 2 fig, 8 ref. Fish and Wildlife Service Contract No 14-17-0007-918.

Descriptors: *Salinity, *Sea water, *Atlantic Ocean, *Streamflow, *Coasts, United States, Mixing, Seasonal, Runoff, Rainfall, Water chemistry, Sampling, Data collections.
Identifiers: U. S. East Coast.

The annual cycle of surface salinity at twelve locations off the east coast of the United States is discussed and related to the discharge and the proximity of rivers. The comparatively large ranges observed at the season of lowest salinity result largely from year to year variation in the time of the minimum and in the strength of the maximum river discharge. Generally the range is smaller in the early months of the year when the watersheds are frozen than in the late months before freezing is complete. (Knapp-USGS)

Available from NTIS as AD-714 233, $3.00 in paper copy, $0.95 in microfiche. Pacific Marine Station Special Scientific Report No 7, July 1970. 45 p, tables.

Descriptors: *Plankton, *Ecology, Ocean circulation, *Ocean currents, Temperature, Salinity, *Sea water, Hydrography, Continental shelf, Pacific ocean, Oceanography.
Identifiers: *Marine biology, Marine meteorology, California, Tomales Bay, Upwelling, Black Swan vessel, Sea state.

Progress during the past year was primarily in the development of an offshore measurement capability and the initial stage of data collection in the region adjacent to Tomales Bay. Preliminary analysis indicates that several cycles of coastal upwelling having a period of five to six weeks, were observed by sequential measurements during the fall and winter months of 1969-1970. A low-cost operational capability has been achieved for the study of detailed density structure of shelf waters. Results not only provide some understanding of the processes affecting Tomales Bay, but indicate a possible relationship of the density structure to be movements of commercially important fish in the area.
W71-06799

A NUMERICAL INVESTIGATION OF TIDAL CURRENT CIRCULATION IN THE GULF OF MAINE,
Naval Postgraduate School, Monterey, Calif.
Arthur Paul Drenna.
Available from NTIS as AD-714 612, $3.00 in paper copy, $0.95 in microfiche. Thesis, MS in Oceanography, Naval Post Graduate School, Oct 1970. 69 p.

Descriptors: *Tides, *Mathematical models, *Ocean currents, *Wind tides, Waves.
Identifiers: *Main Gulf, Tidal height.

The hydrodynamical-numerical model of Walter Hansen is used to compute tidal heights and tidal currents in the Gulf of Maine. The model uses two adjacent open boundaries at which the tides are prescribed at each time step, using four tidal constituents. The grid size is six nautical miles and the time step is thirty-one seconds. Seven data runs are reported; one uses the tides and no wind and the remaining six use uniform wind fields in consort with the tides. A modified method of handling the topographic data is used. The pertinent results of the study are: (1) the use of Hansen's Model with adjacent open boundaries produces broad subjective agreement with observed data, (2) the modified method of handling topographic input data is workable, (3) wind direction and velocity produce slight variations in tidal height, (4) wind direction and velocity modify the direction of the tidal currents considerably and produce some significant increases in tidal current speed, and (5) the modifying influences of wind fields on tidal heights, tidal current velocities, and tidal current directions are more noticeable in shallow water areas than in regions of deep water.

SHALLOW STRUCTURAL CHARACTERISTICS OF FLORIDA ATLANTIC SHELF AS REVEALED BY SEISMIC RELFLECTION PROFILES,
Army Coastal Engineering Research Center, Washington, D.C.
Edward P. Meisburger, and David B. Duane.
Available from NTIS as AD-702 003, $3.00 in paper copy, $0.95 in microfiche. Transactions, Gulf Coast Association of Geological societies, Vol 19, p 207-215, 1969.

Descriptors: *Continental shelf, *Seismic waves, *Sands, *Erosion, Florida.
Identifiers: Seismic reflection profiles, Sand resources.

A sand resources survey off eastern Florida in 1965-66 by CERC resulted in the collection of 2,600 miles of seismic reflection profiles. With a penetration depth range of 0 to -500 feet MLW the profiles extend from nearshore (approximately 15-foot depth) to 15 miles offshore. The records show several prominent acoustic reflecting horizons at shallow depth which can be traced over large areas of the nearshore shelf. These areally extensive reflectors indicate some shallow structural features beneath the shelf surface; tentative stratigraphic correlations have been made in some cases with logged wells onshore. In CERC reflection records, the dominant structural feature is an almost universal eastward dip of strata. Subbottom acoustic horizons on the records are judged to represent a stratigraphic range from Eocene to Recent. Erosional surfaces and shallow water bedform features in the uppermost section are interpreted as resulting from Pleistocene sea level fluctuations.
W71-06928

RECENT SEDIMENTS OF BOLINAS BAY, CALIFORNIA. PART C. INTERPRETATION AND SUMMARY OF RESULTS,
California Univ., Berkeley. Hydraulic Engineering Lab.
P. Wilde, C. Isselhardt, L. Osuch, and T. Yancey.
Available from NTIS as AD-704 694, $3.00 in paper copy, $0.95 in microfiche. Technical Report HEL-2-23, December 1969. 86 p.

Descriptors: *Sedimentation, *Continental shelf, *Petrography.
Identifiers: *Heavy minerals, Bolinas Bay (Calif).

Samples of marine sediments and shore rocks from Bolinas Bay, California, were analyzed for grain size and heavy mineral content. This work, part of a study of sediment transport off Central California, indicates: (1) heavy mineral assemblage is predominantly green hornblende with secondary amounts of hypersthene and augite. Nearshore glaucophane and jadeite occur in locally high concentrations. (2) Distribution pattern of the heavy minerals shows a tongue of high concentrations of minerals that have a granitic source extending northwest from the San Francisco Bay, flanked on the north and northeast by increasing landward concentrations of Franciscan metamorphic minerals. (3) The major source of heavy minerals is the San Francisco Bay. Secondary contributions come from Bolinas Lagoon and the adjacent cliffs. (4) Circulation in the bay is primarily counterclockwise; produced by a combination of wave refraction around Duxbury Reef and the tidal coast eddy current. Tidal influence, however, of Bolinas Lagoon is restricted to about 1 mile from the lagoon mouth. Circulation patterns in the bay greatly influence sediment distribution. (5) Annual sediment flux in Bolinas Bay is about 300,000 cubic yards; bottom sediments are apparently in quasi-equilibrium.

TRACING SAND MOVEMENT IN THE LITTORAL ZONE: PROGRESS IN THE RADIOISOTOPIC SAND TRACER (RIST) STUDY, JULY 1968-FEBRUARY 1969,
Army Coastal Engineering Research Center, Washington, D.C.
David B. Duane.
Available from NTIS as AD-713 001, $3.00 in paper copy, $0.95 in microfiche. Corps of Engineers Miscellaneous Paper No 4-70, August 1970. 52 p, 25 fig, 1 tab, 25 ref.

Identifiers: *Seacoast (Sand), *Sand (Tracer studies), Transport properties, Labeled substances, Radioactive isotopes, Xenon, Radiation measurement systems, Cesium compounds, Sedimentation, Gold, Tides, Beaches, California, *RIST (Radioisotopic Sand Tracer Study), *Radioisotopic sand tracer study, Littoral zone, *Sediment transport.

Tagging procedures, instrumentation, field surveys and data handling techniques have been developed by the radioisotopic sand tracing study for the collection and analysis of over 12,000 bits of information per hour over a survey track of about 18,000 feet. Data obtained can be considered as nearly synoptic observations of sediment transport in a single environmental zone or in adjacent beach, surf and offshore zones. Experiments at Surf, Point Conception, Point Mugu, and Oceanside, California, used sand tagged with isotopes of xenon or gold. Data from studies in beach areas unmodified by littoral barriers indicate that the alongshore velocity of sediment transport differs from zone to zone. Transport seaward of peaking, breaking waves is less than transport on the beach face which is less than transport in the plunge and surf zone. Zone dimensions change with waves and tides. Tracing surveys confined to the foreshore of offshore zones produce data only partly indicative of transport in the zone of immediate concern to coastal engineers. Studies conducted at the site of shore structures indicate the RIST system can provide data useful in understanding the effect of such structures on sediment transport.

SOURCE AND MIXING OF INSOLUBLE CLAY MINERALS IN A SHALLOW WATER CARBONATE ENVIRONMENT - FLORIDA BAY,
University of South Florida, Tampa. Dept. of Geology.
J. P. Manker, and George M. Griffin.
Journal of Sedimentary Petrology, Vol 41, No 1, p 302-306, March 1971. 5 p, 3 fig, 12 ref.

Descriptors: *Bottom sediments, *Provenance, *Sediment transport, *Suspended load, *Clay minerals, Deposition (Sediments), Mud, Marl, Currents (Water), Tides, Tidal effects.
Identifiers: *Florida Bay.

Chlorite and smectite dominate the clay-size insoluble residue of Recent carbonate sediments of Florida Bay. Illite and kaolinite also occur in very small quantities. Chlorite is derived from the Atlantic Coast and eastern Everglades provinces and is introduced by streams and by tidal channels through the northern Florida Keys. Smectite is derived from the Gulf of Mexico province to the west. In the northern part of Florida Bay, water flow is greatly impeded by a complex bank and basin system, and the clay mineral suites remain relatively segregated near their respective sources. However, in the southern part of the bay, banks are less frequent, water flow is less impeded, and the clay mineral suites mix gradually across the area. (Knapp-USGS)

RELATIONSHIP BETWEEN GRAIN SIZE PARAMETER DISTRIBUTION AND CURRENT PATTERNS IN THE GIRONDE ESTUARY (FRANCE),
Inst. of Gelogie du Bassin d'Aquitaine, Facultes des Sciences, Bordeaux, France.
George P. Allen.
Journal of Sedimentary Petrology, Vol 41, No 1, p 74-88, March 1971. 15 p, 16 fig, 43 ref.

Descriptors: *Sediment transport, *Bed load, *Particle size, *Waves (Water), *Estuaries, Bottom sediments, Currents (Water), Sedimentary structures, Sedimentation, Sedimentary petrology, Statistical methods, Distribution patterns.
Identifiers: Gironde Estuary (France).

The bottom sediments in the marine portion of the Gironde estuary were sampled and studied in relationship to the local wave and tidal current patterns. A semi-empirical analysis was conducted to delimit the areas of wave refraction and the bottom orbital velocity variations. Compilation of the current and wave energy data from on-site measurements show that distinct energy zones exist, each characterized by different current strength and type. These zones are controlled by the morphological features of the estuary, the tidal and wave energy zones being mutually exclusive. Most of the tidal current discharge occurs in the deeper channels, whereas the shoal areas are the site of important wave energy. Most of the sediments are sands (phi means between 2.0 and 0.5). A large gravel deposit, however, was observed at the entrance of the estuary. The textural parameter distribution patterns of the sands coincide with and reflect the different energy zones. The gravel deposit is inferred to be a fossil alluvial terrace because it does not seem to be in accord with the present-day current patterns. The inferred transportational processes reflect the established energy zones. A CM curve analysis indicates a graded suspension transport mode for zones where wave energy predominates, and bed-load transport for areas influenced by tidal currents. This effect seems to be corroborated by consideration of the orbital bottom wave velocity as a function of depth. The depth limit for the transporational processes due to wave activity seems to be about 15 meters. Beyond this depth, the sediment is transported mainly by the tidal currents. (Knapp-USGS)

ALKALINE SCALE ABATEMENT BY CARBON DIOXIDE INJECTION,
California Univ., Los Angeles. School of Engineering and Applied Science.
Ronald D. Ellis, Julius Glater, and Joseph W. McCutchan.
Environmental Science and Technology, Vol 5, No 4, p 350-356, April 1971. 7 p, 8 fig, 3 tab, 23 ref.

Descriptors: *Scaling, *Desalination, *Abatement, *Carbon dioxide, Injection, Alkaline water, Magnesium hydroxide, Calcium carbonate, Heat transfer, Temperature, Methodology, Sea water.

Distillation of untreated seawater results in precipitation of alkaline scaling compounds (calcium carbonate and magnesium hydroxide) on heat transfer surfaces. Scale deposition was successfully eleminated by continuous injection of carbon dioxide. Threshold levels for scale control increase with distilling temperature and range from 37 ppm at 255 deg F to 64 ppm at 284 deg F. Profiles of carbon dioxide concentration, pH, and scale composition were studied over a wide temperature range. Special techniques were developed for injection of carbon dioxide and monitoring the concentration in a pressured system. Methods were also determined for collection and analysis of scale deposits. Carbon dioxide injection offers advantages over acid injection or polyphosphate-based additives which are currently used for controlling alkaline scale. (Woodard-USGS)

CONCERNING THE ECONOMIC VALUE OF EXPERIMENTATION IN THE DESIGN OF DESALTING PLANTS,
Department of Commerce, Washington, D.C.
Myron Tribus, and Jacques P. Pezier.
Desalination, Vol 8, No 3, p 311-349, December 1970. 39 p, 8 fig, 6 tab, 13 ref, 2 append.

Descriptors: *Desalination plants, *Design, *Economics, *Decision making, *Optimization, *Statistical methods, Costs, Numerical analysis.
Identifiers: *Utility function, Experimentation.

This paper was concerned with the analysis of the economic worth of design data gathering, that is, the determination of the various coefficients and design parameters which cannot be computed from prior experience or from first principles, for design of desalting plants. In the analysis techniques known under the general title 'Decision Analysis' were used and the Kelvin objective function was shown to represent the balance between capital costs and operating costs for most desalting plants. For the purposes of this paper all costs and income were reduced to present values. Since in practice the designer doesn't know the precise values of the variables the concern here was with the expected value of information computed by the designer before the experiment is undertaken. In the field of Decision Analysis risk preference or aversion is treated by describing a utility function for the decision maker. Two cases of interest, Case 1A: the utility of money equal to its face value and the plant must be built, and Case 2A: the plant is to be built anyway and the utility of money is non-linear were described in detail including equations, examples, experiments and computer programs. A numerical example which considered a plant for which prior expected values were known was illustrated. It was concluded that it is extremely important to determine the exact circumstances under which a system is to be optimized in order to infer the value of information about design of an experiment. 3B. Water Yield Improvement

WILDLIFE VERSUS IRRIGATION,
Science Service, Washington, D.C.
Richard H. Gilluly.
Science News, Vol 99, No 11, p 184-185, March 13, 1971. 2 p, 2 fig.

Descriptors: *Vegetation effects, *Defoliants, *Irrigation, *Wildlife, *Arizona, Reviews, Evaluation, Streams, Banks, Phreatophytes, Water yield, Evapotranspiration.
Identifiers: *Phreatophyte removal controversy.

In Arizona, Federal agencies are studying the removal of phreatophytes-deep-rooted vegetation--from the banks of many rivers in the state. The main purpose of the removal is to conserve water in that arid state. The phreatophytes, stress the advocates of removal, absorb water from the water table and release it to the air through evapotranspiration. Removal of the plants from waterways, they say, will make more water available for downstream irrigation. Bitterly opposing the phreatophyte removal projects, are conservationists and wildlife proponents who say that the riverbank vegetation is the only major wildlife habitat in the arid state. Remove it, they say, and the adverse effects on wildlife will be devastating and sometimes irreversible. Other arguments raging around the phreatophyte removal proposals are discussed. (Woodard-USGS)

A STUDY TO EVALUATE POTENTIAL SOLUTIONS TO THE PROBLEM OF INSURING AN ADEQUATE WATER SUPPLY FOR NEW CASTLE COUNTY, DELAWARE.
University City Science Center, Philadelphia, Pennsylvania.

Available from National Technical Information Service as PB-198 433, $3.00 in paper copy, $0.95 in microfiche. Philadelphia, University City Science Institute, March 22, 1971. 132 p, 12 fig, 19 tab, 43 ref. USCI-ES-3.

Descriptors: *Water management (Applied), *Water resources development, Cost-benefit analysis, Technical feasibility, Water supply, Water demand, Reservoirs, Dams, Inter-basin transfer, Artificial recharge, Ecology, Recreation.
Identifiers: *New Castle County, Delaware, Schuylkill River, Susquehanna River.

This study concludes that current water demand exceeds current safe yield in New Castle County, Delaware, that the deficit may increase by 2 to 3 million gallons per day in the near future, and that, from the economic and engineering viewpoints, the proposed White Clay Creek Dam and Reservoir has the greatest prospect of any proposed project for increasing water supply. Previous engineering, economic, and feasibility studies of the water resources and demand projections in the county are reviewed. Aspects discussed include: projected water demand and county needs, an economic analysis of the White Clay Creek Dam and Reservoir proposal, other currently feasible alternatives, groundwater development, a study of the ecological and aesthetic aspects of the reservoir site, and a projection of economic conditions and financing alternatives. Other alternatives discussed include an interbasin transfer from the Schuylkill and Susquehanna Rivers to the White Clay Creek, proposed by the Mason-Dixon Task Force, and a large-scale artificial groundwater recharge project. Identifiers: *Specific potential, Salinity-resistivity chart (Fresh water), Divalent cations, Formation resistivity, Total dissolved solids, Grain size, Surface conductance, Size analysis, Sorting evaluation.

Evaluation of wells drilled for fresh water present special problems in log analysis. In such analyses the problem is not to distinguish between two types of fluid, as in the evaluation of oil prospects, but to determine the quality and quantity of water that may be obtained from various strata. In oil field interpretation Rw determination through SP analysis is usually satisfactory. There, the interrelations between concentration, activity, and resistivity are well established because NaCl interrelationship does not apply. The SP is used for determination of fresh water quality, but firm empirical data for the locale are required. Measurements of resistivity provide the means for determining relative productivities of fresh water sands. Unconsolidated sands generally exhibit uniformly high porosities; however, a surface conductance effect in fresh water sands causes the formation resistivity factor to vary with both Rw and grain size. Because permeability is related to grain size, resistivity values indicate relative productivity. (Campbell-NWWA)

DESALTING SALINE WATER FOR IRRIGATION--A CASE STUDY--COACHELLA AREA,
Bureau of Reclamation, Boulder City, Nev.
E. S. Krous.
Paper 6th American Water Resources Conferences Conference, Las Vegas, Nevada, October, 1970. 19 p, 8 fig, 4 tab, 15 ref.

Descriptors: *Demineralization, *Saline water, *Agriculture, Salinity, *Irrigation water, Membrane processes, Desalination processes, Water costs, Distillation, Benefit-cost retios, Investment, Crop production, Bibliographies, Brine disposal, Consumptive use (Water), Multistage flash distillation, Operating costs, Water sources, Costs, *Desalination.
Identifiers: *Saline agriculture, Coachella Valley (Calif).

A study was performed to evaluate potential applications of desalted saline water for agriculture using 2 distillation and 2 membrane processes. The investigation determined costs and benefits associated with desalting saline water at concentrations of 1500, 900, 400, 200 and 50 ppm. Benefits from desalting are generated by shifts to more profitable crops, reduced costs for drainage, and reduced fertilizer and labor requirements with better quality water. Costs are based on project features such as desalting plants, raw water diversion facilities, storage reservoirs, conveyance and distribution systems, brine disposal, blending facilities, and gypsum addition systems. Hydrologic studies determined crop irrigation requirements, water demand schedules, desalted water storage requirements, brine disposal requirements, and size of facilities required. Reconnaissance design layouts were made for producing desalted water using a combination of 14 schemes. Benefit-cost ratios range from 0.4 to 1.0 for 1500 ppm irrigation water to 0.8 to 1.0 for 50 and 200 ppm water. Investment costs per acre are high, ranging from $12,900 to $20,900. Irrigation benefits are based on the increase in production from a desert condition with no water supply to the irrigation conditions studied. (USBR)

WATER FOR INDUSTRIAL DEVELOPMENT IN AMITE, FRANKLIN, LINCOLN, PIKE, AND WILKINSON COUNTIES, MISSISSIPPI,
Geological Survey, Jackson, Miss. Water Resources Div.
Roy Newcome, Jr., and F. H. Thomson.
Mississippi Research and Development Center Report, 1970. 61 p, 20 fig, 12 tab, 20 ref, append.

Descriptors: *Water resources, *Industrial water, *Appraisals, *Planning, *Mississippi, Groundwater, Streamflow, Water quality, Hydrologic data, Geohydrologic units, Artesian wells, Water resources development, Water utilization, Perennial streams.
Identifiers: Amite County, Franklin County, Lincoln County, Pike County, Wilkinson County.

Details are given on availability, chemical quality, and physical characteristics of groundwater and surface water of this five-county area in southwest Mississippi, based on an investigation begun in July 1967. Designed as a planning guide for development and management of water supplies, the report contains 20 illustrations, 12 data tables, and the interpretive text. Five geohydrologic sections in different parts of the area show depth and thickness of aquifers, clayey beds, and the base of fresh water; maps and tables give the DO and low-flow velocities for major streams; and data tables given chemical analyses, streamflow records, well records, and

data on potential supply at selected places. Streams and aquifers have scarcely been tapped for water supplies and present pumpage from wells totals less than 10 mgd. The only significant water problem is excessive iron; most public and industrial water supplies are aerated for iron removal. Sixteen streams in the area can supply 5 mgd each without storage during drought periods; 8 could supply 10 mgd each and 3 streams could supply 100 mgd each. With storage, the Homochitto River could provide 350 mgd and Bogue Chitto 250 mgd in a drought of 10-yr recurrence interval. The 1,300- to 3,000-ft section of Miocene sand and clay contains numerous artesian aquifers of various thicknesses and irregular extent. Only a few wells produce more than 500 gpm, but a great many of the aquifers could support well yields of 2,000 gpm, or more. The groundwater is soft and low in mineralization (usually less than 200 mg per liter). Natural thermal conditions may preclude some uses of surface water for industrial needs. (Lang-USGS)

California University Water Resources Center Contribution No 133, June 1970. 93 p, 43 fig, 6 tab, 7 ref, append. Water Resources Center Project UCAL-WRC-70-W-175.

Descriptors: *Irrigation design, *Automation, Irrigation ditches, Irrigation programs, Irrigation systems, Irrigation efficiency, California, Topography, Furrow irrigation, Application equipment, Water distribution (Applied).
Identifiers: *Automatic irrigation equipment, *Sierra Nevada (Calif.).

This report describes, in detail, a surface irrigation system which makes more efficient use of water and labor in the rolling lands of the Sierra Nevada Foothills than do existing systems, and at only a slight increase in capital cost. Design details are included, with some management techniques for the system as applied to irrigated pastures. Much of the information is applicable to other crops. Fully-automatic or semi-automatic check structures allow the irrigator to make several sets at a single visit to a field. A system of outlets retains its settings and is unaffected by animals within the field, ground settlings, or factors other than the level of the water in the supply ditch. A system of corrugations (small furrows) runs downslope from the head or distribution ditches. These corrugations, if properly constructed and maintained, assure that any water properly distributed at the upper edge of the field (by the outlets) will be properly distributed at the lower edge of the field. Upon operation, with no increase in labor, the water application efficiency (usefully applied water divided by total applied water) was increased from about 35 percent to 80 percent. (Knapp-USGS)

FLOOD PLAIN INFORMATION, NORTH BRANCH PENNSAUKEN CREEK, BURLINGTON COUNTY, NEW JERSEY.
Corps of Engineers, Philadelphia, Pa.

Corps of Engineers Flood Plain Report, December 1970. 49 p, 8 fig, 10 plate, 8 tab.

Descriptors: *Floods, *Flood damage, *Flood plains, *New Jersey, Regional flood, Flood forecasting, Flood control, Peak discharge, Rainfall-runoff relationships, Historic flood.
Identifiers: *Burlington County (NJ), Standard project flood, Intermediate regional flood.

Flooding along the North Branch of Pennsauken Creek from its confluence with the South Branch upstream to the New Jersey Turnpike bridge and the Strawbridge Lake tributary from its confluence with North Branch upstream to the New Jersey Route 38 bridge is described to aid in solving local flood problems and in planning the best utilization of flood-prone lands. Maps, profiles, cross sections and other material relating the extent of past flooding to floods which might occur in the future are based on available records of rainfall, runoff, historical flood heights and other technical data. The greatest flood known to have occurred in the lower reaches of Pennsauken Creek is the August 1933 flood resulting from tidal flooding on Delaware River. This flood produced stages of 9.0 feet, mean sea level datum at the mouth of Pennsauken Creek and 11.0 feet at the confluence with the South Branch. (Woodard-USGS)
W71-06517

FLOOD PLAIN INFORMATION, BIG COTTON INDIAN, LITTLE COTTON INDIAN, TAR AND PANTHER CREEKS - PART 1. METROPOLITAN ATLANTA, GEORGIA.
Corps of Engineers, Savannah, Ga.

Corps of Engineers Flood Plain Report, January 1971. 44 p, 21 fig, 58 plate, 13 tab.

Descriptors: *Floods, *Flood damage, *Flood plains, *Georgia, Regional flood, Flood forecasting, Flood control, Historic flood.
Identifiers: *Henry and Clayton Counties (Ga), Standard project flood, Intermediate regional flood.

Flooding in Henry and Clayton Counties, Georgia, along Big Cotton Indian, Little Cotton Indian, Tar, and Panthers Creeks from the mouth of Big Indian Creek on South River to their headwaters is described to aid in solving local flood problems and in planning the best utilization of flood-prone lands. Maps, profiles, cross sections and other material relating the extent of past flooding to floods which might occur in the future are based on available records of rainfall, runoff, historical flood heights and other technical data. The storm of December 7-10, 1919 produced the flood of record. Moderate precipitation occurred December 6-8, but on December 8-9 there was 11.8 inches of rainfall recorded at the Atlanta station. Based on information of high water marks on nearby streams, this flood has a frequency of over 100 years. (Woodard-USGS)

STOCHASTIC DYNAMIC PROGRAMMING FOR OPTIMUM RESERVOIR OPERATION,
Texas Univ., Austin, Center for Research in Water Resources.
William S. Butcher.
Water Resources Bulletin, Vol 7, No 1, p 115-123, February 1971. 9 p, 3 fig, 12 ref.

Descriptors: *Dynamic programming, *Stochastic processes, *Optimization, Water resources development, *Multiple-purpose reservoirs, Operations, Monthly, Time, Streamflow, Equations.
Identifiers: *Watasheamu Dam.

A study in which an optimal operating policy for a multipurpose reservoir was determined was presented, where the optimal operating policy was stated in terms of the state of the reservoir indicated by the storage volume and the river flow in the preceding month and used a stochastic dynamic programming approach. Watasheamu Dam, a dam proposed to be built by the Bureau of Reclamation near the Nevada-California state line was used for application of this method. Streamflows at the site were measured for 28 years and return functions and physical data for the dam were available. A time period of one month was chosen. The formulation of the dynamic programming recursive equation was shown. To carry out the calculations, it was necessary to first describe the probabilities of a stream having one flow value in one time period, and another in the next time period. The correlation between monthly stream flows was analyzed by a method in which a linear regression line was established between flows of successive months by a least squares fit to determine a linear relationship between two time periods. With this modified formulation and data for the Watasheamu Dam site, calculations were made by computer. Sample results of the optimum policy determination were given for one of the possible twelve months of the year. (Kriss-Cornell)

HEC-3 RESERVOIR SYSTEM ANALYSIS.
Corps of Engineers, Davis, California. Hydrologic Engineering Center.

Computer Program 723-X6-L2030, Hydrologic Engineering Center, Corps of Engineers, US Army, Davis, California, February 1971. 139 p.

Descriptors: *Computer programs, *Systems analysis, *Reservoirs, *Flow, *Optimization, *Multiple-purpose projects, Input-output analysis, Powerplants, Economics.

The computer program presented was written in Fortran IV and performed a multipurpose routing of a reservoir system by any number of periods of uniform varying length per year based on varying flow requirements at reservoirs, diversion and downstream control points and power peaking and energy requirements at reservoirs. It accepted any configuration of reservoirs, diversions, power plants and control points, and accepted system power demands that override individual power plant requirements, but did not provide for channel routings or percolation losses. It could assign economic values to all outputs and summarize and allocate these in various ways. It could automatically iterate to optimize yield at a specified location. All requirements were supplied from reservoirs so as to maintain a specified balance of storage in all reservoirs and was capable of performing short-interval flood studies. The program was prepared for use in the CDC 6600 computer and all project requirements could be entered in any sequence, but were performed in downstream sequence each period. Input and output data were summarized in the exhibits and operating instructions were given. Proposed future development for the program was discussed. (Kriss-Cornell)

FINANCING CONSTRUCTION OF A MAJOR DRAINAGE IMPROVEMENT,
Peter M. Callihan.
Public Works, Vol 100, No 6, p 105-106, June 1969.

Descriptors: *Storm runoff, *Construction costs, Drainage systems, California.
Identifiers: Drainage improvements.

Rohnert Park, Sonoma County, and the Sonoma County Flood Control District have developed a new method of financing major drainage channels. One channel, which served as a major drainage facility to accommodate storm flows from the anticipated high density development area, could not be improved because of costs. A policy requiring land developers to improve all major drainage ways was adopted and the problem was solved. A large drainage area plan is discussed along with problems of financing its improvements.

NORTH RACCOON RIVER FLOOD PLAIN INFORMATION, SAC COUNTY, IOWA.
Corps of Engineers, Rock Island, Ill.

Corps of Engineers Flood Plain Report, June 1970. 51 p, 38 fig, 11 plate, 9 tab.

Descriptors: *Floods, *Flood damage, *Iowa, Flood plains, Regional flood, Flood forecasting, Flood control, Historic flood.
Identifiers: Sac County (Iowa), Standard Project Flood, Intermediate Regional Flood.

The flood situation along the North Raccoon River flood plain, in Sac County, Iowa, starting from the county bridge at mile 3.0 upstream to the county bridge at mile 11.97 is described to aid in solving local flood problems and in planning the best utilization of flood-prone lands. Maps, profiles, cross sections, and text material relating the extent of past flooding to floods which might occur in the future are based on available records of rainfall, runoff, historical flood heights and other technical data. Flood duration on the North Raccoon River is relatively long. During the flood of September 1, 1962, the water rose from an initial stage of 5 feet to peak stage of 18.12 feet in less than 2 days and remained above bankfull stage for 12 days. During the March 1960 flood, the river rose to peak stage of 16.73 feet in about 2 days and remained above bankfull stage for 8 days. (Woodard-USGS)

CEDAR RIVER FLOOD PLAIN INFORMATION, BLACK HAWK COUNTY, IOWA.
Corps of Engineers, Rock Island, Ill.

Corps of Engineers Flood Plain Report, June 1970. 72 p, 44 fig, 27 plate, 9 tab.

Descriptors: *Floods, *Flood damage, *Iowa, Flood plains, Regional flood, Flood forecasting, Flood control, Historic flood.
Identifiers: *Black Hawk County (Iowa), Standard Project Flood, Intermediate Regional Flood.

Flooding in Black Hawk County, Iowa, along Cedar River and Elk Run Creek, including the cities of Evansdale, Waterloo, Cedar Falls, and Elk Run Heights is described to aid in solving local flood problems and in planning the best utilization of flood-prone lands. Maps, profiles, cross sections, and text material relating the extent of past flooding to floods which might occur in the future are based on available records of rainfall, runoff, historical flood heights and other technical data. The greatest known flood occurred in March 1961. Maximum recorded stage at the USGS gaging station was 21.86 feet (elevation 845.95 feet above mean sea level, datum of 1929). The maximum discharge during this flood was 76,700 cfs on March 29, 1961. Standard Project Flood determination indicates that floods could occur on the Cedar River between 6.1 and 12.1 feet higher than the March 1961 flood. (Woodard-USGS)

FLOOD CONTROL PROVISED MAJOR BENEFITS,
Walter J. Wood, and N. Christian Datwyler.
Public Works, Vol 101, No 6, p 67-68, Jun 1970.

Descriptors: *Drainage systems, *Flood control, *Storm drains, Overflow.
Identifiers: *Connecting tunnel.

The Department of Housing and Urban Development recently granted funds to the Los Angeles County Flood Control District for the construction of a storm drainage system. Such a system will eliminate problems caused by accumulated stormwater sumps along the undulating terrain of the area. Such stormwater accumulations have caused drownings and mosquito proliferation, and they sometimes overflow and flood surrounding areas or infiltrate the sewer system creating a health hazard. The project consists of a tunnel connecting storm drains to the Pacific Ocean. The new drainage system will encourage redevelopment in the area by resolving the problems presently making the region an unattractive and often-dangerous place to live.

DRAINAGE STUDY - INVENTORY AND ANALYSIS.
Genesee/Finger Lakes Regional Planning Board, Rochester, N.Y.

Available from NTIS as PB-194 682, $3.00 in paper copy, $0.95 in microfiche. Technical Studies Series No 2, Regional Planning Bd, Rochester, NY, Oct 1969. 130 p, 23 ref.

Descriptors: *Watersheds (Basins), *Drainage, *Drainage programs, Rivers, Lakes, Economic impact, Surface waters, Floods, Population.
Identifiers: *Regional planning, *New York, *Genesse County (New York), *Finger Lakes Region.

The report presents an analysis of the four drainage basins within the Genesee/Finger Lakes Region which provides basic information that will be utilized in future plans and recommendations for the Region. A brief description of the area, topography, climate, population and economy introduces the inventory of the Lake Ontario, Genesee, Oswego and Erie-Niagara Drainage Basins. The heart of this drainage study is devoted to a detailed description of the major lakes, rivers and streams in the four drainage basins.
W71-06790

SELECTION OF MATERIALS FOR SUB-SURFACE DRAINS,
Road Research Lab., Crowthorne (England).
R. Spalding.

Available from NTIS as PB-195 258, $3.00 in paper copy, $0.95 in microfiche. Road Research Laboratory Report LR 346, Crowthorne, 1970. 28 p, 15 fig. (Out of text).

Descriptors: *Sub-surface drains, *Materials, *Roads, Pipes, Drainage systems, Construction materials, Soils, Groundwater, Silts, Permeability, Porosity, Clays, Great Britain.
Identifiers: *Underground drains, Tubes, Fluid filters.

The report discusses the part played by the various components of a sub-surface drain in achieving adequate permeability and in preventing clogging of the drain by silt. Present criteria for the grading limits of the backfill and the porosity of the pipes in a drain are reviewed.
W71-06797

THAI AIR BASE FLOOD CONTROL,
T. L. Adams, and A. C. McNulty.
Military Engr, Vol 61, No 403, p 361-362, Sep-Oct 1969. 1 diag.

Descriptors: *Flood control, *Drainage systems, *Design storm, *Reservoir storage, Runoff.

Expansion of a Royal Thai Air Force Base necessitated development of a flood control system to alleviate drainage problems. An area-wide drainage study considered four possible solutions: (1) a concrete-lined trapezoidal channel to carry runoff around the new runway overrun; (2) a collection basin and pump near the runway; (3) a multicell box culvert under the runway extension; and (4) a flood control storage reservoir with controlled discharge. The economics and feasibility of the four plans were discussed based on a two-year design storm condition, and the storage reservoir method was decided upon. Interior base drainage consisted of a system of ditches, collection channels, and storage basins, plus three pump stations. The new flood control system will also somewhat relieve flooding of the neighboring city by decreasing the runoff rate to it.

RAPID MEASUREMENT OF DRAINAGE DENSITY,
Kentucky Univ., Lexington. Dept. of Geography.
Roger M. McCoy.
Geological Society of America Bulletin, Vol 82, No 3, p 757-762, March 1971. 6 p, 4 fig, 1 tab, 7 ref.

Descriptors: *Terrain analysis, *Drainage patterns (Geologic), *Drainage density, Drainage systems, Channel morphology, Geomorphology, Estimating, Maps, Mapping, Radar, Remote sensing, Analytical techniques, Surveys, Topography, Photogrammetry.
Identifiers: Drainage density measurement.

Investigations were made into three methods for rapid measurement of drainage density using topographic maps and radar imagery. Measurement of blue line stream symbols proves feasible but is weak due to inconsistencies. The number of intersections of streams on a random line pattern overlying a map provides a good estimate of drainage density. Edge-enhancement of radar images produces a measurable line pattern which appears to be strongly-related to total length of streams in a basin. (Knapp-USGS)

A HYDROLOGIC MODEL OF THE BEAR RIVER BASIN,
Utah Water Research Lab., Logan.
Robert W. Hill, Eugene K. Israelsen, A. Leon Huber, and J. Paul Riley.
Available from National Technical Information Service as PB-198 430, $3.00 in paper copy, $0.95 in microfiche. Report PRWG72-1, August, 1970. 85 p, 28 fig, 8 tab, 4 append. OWRR Project B-028-UTAH (2).

Descriptors: *Model studies, *Simulation analysis, Models, Groundwater, *Watersheds, Basins, Snowmelt, Evapotranspiration, Percolation water yield, *Hydrologic cycle, Hydrologic data, Water yield improvement, Soil moisture, *Planning, Watershed management, Hybrid computers.
Identifiers: Hybrid computers.

As demands upon available water supplies increase, there is an accompanying increase in the need to assess the downstream consequences resulting from changes at specific locations within a hydrologic system. The problem is approached in this study by hybrid computer simulation of the hydrologic system. Modeling concepts are based upon the development of basic relationships which describe the various hydrologic processes. Within a system these relationships are linked by the continuity-of-mass principle which requires a hydrologic balance at all points. Spatial resolution is achieved by considering the modeled area as a series of subbasins. The time increment adopted for the model is one month, so that time varying quantities are expressed in terms of mean monthly values. The model is general in nature and is applied to a particular hydrologic system through a programmed verification procedure whereby model coefficients are evaluated for the particular system. In this study the model was synthesized on a hybrid computer and applied to the Bear River basin of western Wyoming, southern Idaho, and northern Utah. Comparisons between observed and computed outflow hydrographs for each subbasin are shown. The utility of the model for predicting the effects of various possible water resource management alternatives is demonstrated for the number 1, or Evanston subbasin. The hybrid computer is very efficient for model development, and the verified model can be readily programmed on the all-digital computer.

RECHARGE OF AQUIFERS IN ARID ZONES AND EFFECTIVE POROSITY COEFFICIENT,
M. Boreli.
Transactions Institute for Development of Water Resources, 'Jaroslav Cerni,' Vol 14, No 45, p 13-19, 1969. 7 p, 6 fig, 5 ref.

Descriptors: *Recharge, *Pit recharge, *Surface-groundwater relationships, *Conjunctive use, *Water storage, Analog models, Hydraulic models, Model studies, Artificial recharge, Arid lands, Water management (Applied), Reservoir leakage, Seepage, Groundwater movement, Unsteady flow.
Identifiers: Yugoslavia.

The combination of surface and underground reservoirs is an attractive solution for the problems of arid zones using the surface reservoir as a storage basin for the recharge of the aquifer. The duration of surface storage ought to be as short as possible, and recharge ought to take place in the cold season when the loss of water due to evaporation is considerably smaller. Occasional drying out of the reservoir is indispensable to keep recharge rates high, especially because in warm regions biological clogging of the bottom of the reservoir is considerable and inhibits recharge. The study of intermittent recharge of aquifers is therefore of great practical importance. Several types of intermittent recharge used in the Mediterranean littoral include some cases of lateral recharge in reservoirs with impermeable bottoms, with recharge only through the sides. Intermittent recharge of aquifers, lateral recharge and in particular intermittent lateral recharge cause a very complicated unsteady flow. Because of its simplicity the viscous fluid analog seems to be the most suitable method of study of the recharge zone. (See also W71-06704) (Knapp-USGS)

GROUNDWATER AND WELLS.
University Oil Products, St. Paul, Minn. Johnson Div.

St Paul, Edward E Johnson, 1966. 440 p.

Descriptors: *Water wells, *Drilling, Drilling equipment, Rotary drilling, Drawdown, Specific yield, Well hydraulics, Well screens, Corrosion, Water quality, Hydrology.
Identifiers: Groundwater regions, Well hydraulics, Groundwater exploration, Analyzing sand samples, Water well design, Well screen installation, Developing and completing wells, Disinfection, Maintaining well yield, Elements of water treatment, Well specifications, Pumps, Sanitary protection of a water supply, Groundwater conservation and utility.

The purpose of this book is to present the technical aspects of groundwater occurrence, groundwater movement, well hydraulics, well design and groundwater geology together with the practical aspects of well drilling, well screen selection, well maintenance and well operation. It describes and explains in some detail the operations that depend upon the skill of the well contractor and his drilling crews and endeavors to present practical, proven ideas. Well construction, by its very nature, is not a routine process. The variability of geologic conditions - and that of groundwater occurrence within the geologic framework - are so extensive as to make each drilling operation an exploratory undertaking, even a few tens of feet distant. The skill of the well driller that enables him to handle unforeseen situations successfully is basic to proper groundwater development. This book is an excellent source of information for the driller. (Campbell-NWWA)

GEOPHYSICS AS AN AID TO THE SMALL WATER WELL CONTRACTOR,
Lansing Board of Water and Light, Mich.
C. J. Linck.
Groundwater, Vol 1, No 1, p 33-37, January 1963. 6 fig, 5 ref.

Descriptors: *Borehole geophysics, *Water wells, Resistivity, Radioactivity, Seismic studies, Logging (Recording), Electric logging, Aquifer characteristics, Geophysics, Groundwater, Exploration.
Identifiers: Seismic refraction exploration.

Geophysical techniques, as used in groundwater exploration are subdivided into 'bore-hole' and 'surface' methods. The former include the commonly used electrical and gamma-ray logging and the less commonly used hole calipering and current meter logging. Included with this classification, but important enough to be considered separately, is the field of water-level measurements. The surface techniques discussed include electrical resistivity and refraction seismograph exploration. Because of the type of data which they yield the surface methods are most economical where much area is to be explored and large quantities of water are needed. These factors limit the use of the techniques by small water well contractors in domestic water well work. These same contractors, on the other hand, can gain real economic advantages, in many cases, by use of one or more of the bore-hole methods. Geophysical methods properly used can do much to guide the water well contractor. It is extremely important, however, that their use be carefully directed because in the past, where geophysical methods have failed, it has often been due to the incorrect application of the technique, rather than a failure of the technique. LOGGING DRILL CUTTINGS,
Geological Survey, Norman, Okla.
J. C. Maher.
Oklahoma Geol Surv Guide Book 14, 1964, (2nd Edition). 48 p, 60 ref.

Descriptors: Sampling, *Drilling, *Oil industry, *Water wells, Cores, On-site data collections, Logging (Recording).
Identifiers: *Drillers' logs, Drilling time logs, Electric logs, Radioactivity logs, Sample logs, Cable-tool cuttings, Rotary-tool cuttings, Air-drill cuttings.

This report has been prepared primarily to provide a reference, a manual, and a set of descriptive standards for subsurface investigations in the Midcontinent region. As a reference, it provides details of commonly used procedures which cannot be fully described in every subsurface report. As a manual, it should aid in orienting or training geologists in subsurface methods. As a set of descriptive standards, it is hoped that it will encourage greater care and standardization in all phases of preparation of sample logs because these logs form the foundation upon which the geologic history of sedimentary basins may be reconstructed. Specifically this report describes the preparation of composite interpretive logs and presents a system of description including terminology and definitions, abbrevations, and symbols. General discussions of drillers logs, drilling-time logs, electric logs, radioactivity logs, and sample logs are included to explain their supporting role in preparing composite interpretive logs. It is intended to show the advantages and limitations of this method, and to define somewhat more specifically the terms that have become firmly established in subsurface work during the past 40 years and are now recorded on hundreds of thousands of well logs in oil-company and government-agency files. It is also of use to drillers to help them appreciate the primary problems of the geologist and to offer guidance in the preparation of a better driller's log. (Campbell-NWWA)

ON THE MANAGEMENT OF GROUNDWATER IN COASTAL AQUIFERS,
North Carolina State Univ., Raleigh. Dept. of Civil Engineering.
Abdel-Aziz I. Kashef.
Groundwater, Vol 9, No 2, p 12-20, March-April 1971. 9 p, 56 ref.

Descriptors: *Reviews, *Water management (Applied), *Groundwater, *Water resources development, *Saline water intrusion, Withdrawal, Drawdown, Sea water, Coasts, Aquifers.
Identifiers: Coastal aquifers.

Groundwater management in coastal aquifers is an important phase in water resources especially in the operation of existing coastal wells or in planning new coastal well fields. Basic research to evaluate properly the various elements of sound management should not be overlooked. Basic research is still needed to study the roots of the problem. Aquifers should be studied as hydrogeologic units for the benefit of all interested parties. Economic and legal decisions have to be made to establish priorities and allotments. Extensive basic research is needed in salt-water encroachment. Extensive research is needed to solve many of the water recharge and leakage problems. (Knapp-USGS)

WELLS AND SPRINGS IN CALIFORNIA AND NEVADA WITHIN 100 MILES OF THE POINT 37 DEGREE 15' N., 116 DEGREE 25'W., ON NEVADA TEST SITE,
Geological Survey, Denver, Colo.
William Thordarson, and B. P. Robinson.
Available from the National Technical Information Service as USGS-474-85, $3.00 in paper copy, $0.95 in microfiche. Geological Survey Report USGS - 474-85, 1971. 178 p, 4 fig, 8 tab, 77 ref. USAEC Agreement No AT (29-2)-474.

Descriptors: *Data collections, *Hydrologic data, *Nevada, *Wells, *Springs, Reviews, Nuclear explosions, Water yield, Damages, Legal aspects, Groundwater, Aquifers, Hydrogeology, Alluvium.
Identifiers: *Nevada Test Site.

Studies of published and unpublished geologic and groundwater data were reviewed for an inventory of 6,032 wells and 754 springs in parts of Inyo and Mono Counties, California, and Clark, Esmeralda, Lincoln, and Nye Counties, Nevada. A complex sequence of granitic, metamorphic, volcanic, and sedimentary rocks of Precambrian to Holocene age are present in the study area. The valley fill alluvium is the best aquifer. The carbonate and the volcanic rocks produce small to large amounts of water from fractures or solution cavities. The clastic rocks and the metamorphic and granitic rocks produce very little groundwater. The greatest concentration of wells in the study area is in the Las Vegas area, which has 79% of the total wells inventoried. The Las Vegas area has less than 1% of the springs inventoried. The major uses of groundwater listed in order of abundance, for the area exclusive of Las Vegas, are irrigation, domestic, public supply, and industrial. The major uses of groundwater listed in order of abundance in the Las Vegas area are domestic, irrigation, public supply, and commercial. (Knapp-USGS)
W71-07029

PUMPAGE AND GROUNDWATER STORAGE DEPLETION IN CUYAMA VALLEY, CALIFORNIA, 1947-66,
Geological Survey, Menlo Park, Calif.
John A. Singer, and W. V. Swarzenski.
Geological Survey Open-file Report, August 3, 1970. 22 p, 7 fig, 3 tab, 9 ref.

Descriptors: *Groundwater, *Overdraft, *Recharge, *California, *Water resources development, Aquifers, Hydrogeology, Pumping, Withdrawal, Drawdown, Water levels, Water level fluctuations, Water quality, Water table, Water utilization, Irrigation.
Identifiers: *Cuyama Valley (Calif).

Water-level declines of as much as 160 feet have occurred in the Cuyama Valley since 1947. The 1947-66 overdraft is estimated at 21,000 acre-feet annually and is causing a water-level decline from 2 to 8 feet per year over an area of about 35,000

acres. Most of the groundwater body is unconfined, but groundwater movement is restricted by faulting. About half of the current natural groundwater recharge is used in the valley, and the other half is lost by evapotranspiration. Groundwater quality is only fair and is gradually becoming worse as water from irrigated land returns to the water table. In many areas of the valley imported water could be successfully recharged to the groundwater basin by spreading in surface-recharge basins. Recharging might be most beneficial where permeable deposits have a large unsaturated storage capacity. (Woodard-USGS)

WATER WELL EXPLOSIONS: AN ENVIRONMENTAL HAZARD,
Pennsylvania State Univ., University Park. Coll. of Earth and Mineral Sciences.
D. P. Gold, R. R. Parizek, and T. Giddings.
Earth and Mineral Sciences, Vol 40, No 3, p 17-19, December 1970. 3 p, 5 fig, 12 ref.

Descriptors: *Water wells, *Domestic water, *Explosions, *Pennsylvania, Thunderstorms, Lightning, Electric motors, Gases, Evaluation.
Identifiers: *Water-well explosion.

During a thunderstorm on June 12, 1970, an explosion in a water well in the yard of a private dwelling (14 miles east of State College, Pennsylvania) demolished a concrete pump house and excavated a crater 25 feet across. The explosion threw debris hundreds of feet into the air, and the pump itself (200 lb) cleared the adjacent trees and a 38-foot high power line and landed in the field across the highway, 179 feet away. From the geologic setting and landuse, the type of explosive can be narrowed down to a gas accumulation from either (1) a flammable pollutant, (2) decomposed organic material, or (3) fossil gas or petroleum. The cause of this explosion may never be determined, but the presence of a flame reported by an eyewitness and the lack of burn marks in the crater suggest an explosion deep within the well shaft. Descriptors: *Recreation facilities, *Urbanization, *Flood protection, *Watershed management, *Environmental effects, Water conservation, Dry seasons, Coliforms, Decision making, Planning, Control, Chemical oxygen demand, Economic feasibility, Recharge, Domestic water, Activated carbon, Irrigation water, Water requirements, Chlorination, Turbidity, Runoff, Rainfall, Data collections, Simulation analysis, Mathematical models, Water management (Applied), Water quality, Water reuse, Treatment, Storm runoff, Flood damage, Flood control, Flood plains, Convection, Water levels, Arizona, Water wells, Arid lands.
Identifiers: *Greenbelts, *Rainfall-runoff-water quality process, *Urban watershed, *Rural watershed, Alum, Tucson.

Southwestern arid cities are rapidly growing. Additional wells, which support subdivisions, grassed medians, parks and water-based recreation, contribute to perennial water-level declines. Storm sewers are usually nonexistent. Vehicles may be washed away, and urbanites may drown during summer convective storms. A more reasonable urban plan includes: (1) allow homes only outside flood plains; (2) create greenbelts along channels; (3) manage storm runoff to reduce peaks, provide storage, treatment and reuse; and (4) depress medians. Field data from urban areas, regarding storm volumes and intensities, and runoff quality and quantity, are urgently needed to manage storm water. Mathematical models and simulations for analyzing rainfall-runoff-water quality processes need to be developed, refined and applied. Data is being collected on 3 urban and 2 rural watersheds in Tucson by the University of Arizona as a data base. About 2 1/2% of the rainfall becomes runoff in the rural watersheds. Urban runoff is low in turbidity, which may be reduced by alum, and high in COD and fecal coliforms, particularly after sustained dry periods. Chlorination would allow irrigation or water-contact recreation. Activated carbon process, before chlorination, would allow domestic use. Future work includes detailed rainfall and runoff water-quality analysis, treatment, storage and recharge studies, economic analysis and pilot studies. (Popkin-Arizona)

DRAINAGE OF ROADS AND PAVED SURFACES,
M. J. Hamlin, and F. D. Hobbs.
Inst. of Public Health Engrs, Vol 69, Part 2, p 122-141, Apr 1970.

Descriptors: *Rainfall intensity, *Storm drains, Hydraulic design, Roads.
Identifiers: *Stormwater inlets.

Factors to be considered in designing stormwater inlets for roads are discussed utilizing hydraulic requirements rather than a purely empirical viewpoint. Rainfall intensity is one determining factor since, theoretically, rainfall intensity is a function of the area to be drained. The intensity of rainfall and the period for which it lasts varies across the country, and therefore, this factor must be carefully evaluated before designing stormwater inlets.

EFFECTS OF URBAN DEVELOPMENT ON FLOODS IN NORTHERN VIRGINIA,
Geological Survey, Washington, D.C.
Daniel G. Anderson.
For sale by Superintendent of Documents, US Government Printing Office, Washington, D.C. 20402, 25 cents. Geological Survey Water-Supply 2001-C, 1970. 22 p, 5 fig, 5 tab, 10 ref.

Descriptors: *Rainfall-runoff relationships, *Urbanization, *Flood damage, *Virginia, *District of Columbia, Erosion, Watersheds (Basins), Hydrologic data, Floods, Mathematical studies, Geomorphology, Streamflow, Precipitation (Atmospheric), Land use, Effects, Peak discharge, Drainage, Runoff, Drainage systems, Planning, Sediment transport, Flood forecasting, Hydrograph analysis.
Identifiers: *Urban Hydrology, Northern Virginia.

Graphical and mathematical relations are presented to estimate the flood-peak magnitudes having recurrence intervals ranging up to 100 years for drainage basins with various degrees of urban or suburban development. Five independent variables are required for use of the relations. They are the size, length, and slope of the basin, which may be measured from maps, and the percentage of impervious surface and type of drainage system, which may be evaluated by a basin inspection but in actual practice will usually be estimated for future developed conditions. Based upon analysis of flood information for 81 sites, 59 of which are in the Washington, D.C., metropolitan area, the relations should be useful for design of drainage systems and for definition of flood limits. The relations presented are applicable only to the Washington, D.C., area, but the method of analysis is general and may be used for any area where the major floods result from rainfall. Urban and suburban development affect floodflows significantly. Improvements of the drainage system may reduce the lag time to one-eighth that of the natural channels. This lag-time reduction, combined with an increased storm runoff resulting from impervious surfaces, increases the flood peaks by a factor that ranges from two to nearly eight. The flood-peak increase depends upon the drainage-basin characteristics and the flood recurrence interval. (Woodard-USGS)

CONSERVATION PROGRAMS IN THE URBAN FRINGE,
John W. Neuberger.
J Soil Water Conserv, Vol 24, No 6, p 216-618, Nov/Dec 1969. 6 ref.

Descriptors: *Conservation, *Storm drains, *Drainage, Erosion control, Runoff, Sediment control, Nebraska, Urbanization, Water pollution control.

Solutions to land erosion and drainage problems caused by suburban sprawl in a Nebraska conservation district are outlined. Increased paving, roofing, and compacted soils result in erosion and flooding; therefore, the construction of major and minor storm drainage and water runoff systems is recommended. An Omaha program to reduce sedimentation from developing areas is detailed in addition to guidelines for good land resource conservation. Examples of developers' initiatives towards furthering the urban conservation program are cited.

EFFECT OF A COMMERCIAL CLEARCUTTING IN WEST VIRGINIA ON OVERLAND FLOW AND STORM RUNOFF,
Kenneth G. Reinhardt.
Forest, Vol 62, No 3, p 167-171, 1964.

Descriptors: *Rainfall-runoff relationships, Watershed management, Watersheds (Basins), Overland flow, Storm runoff, West Virginia, Infiltration, Hydrologic aspects.
Identifiers: Experimental watersheds.

A commercial clearcutting was made on a 74-acre gaged watershed on the Fernow Experimental Forest; skidroads were loggers' choice--without limitations as to grade or provisions for drainage. After-logging infiltration rates in the watershed remained well maximum rainfall intensities except on portions of the skidroads. Overland flow occurred only from the skidroads; it resulted from the combination of rain directly on the skidroads and interception of subsurface flow by the road cuts. Increased storm runoff in the growing seasons--up to a maximum of about 1/2 area-inch in any one storm--was largely the result of decreases in field-moisture deficiency rather than changes in the proportions of surface and subsurface flow. This study indicates that, in judging hydrologic condition of logged areas, perhaps as much emphasis should be placed upon road conditions and forest-floor disturbance as upon the amount of timber cut and condition of the stand.

CONTROL OF SEDIMENT FLOW INTO SUBSURFACE DRAINS,
Ohio Agricultural Research and Development Center, Columbus; and Agricultural Research Service, Columbus, Ohio. Soil and Water Conservation Research Div.
Om P. Gulati, Glenn O. Schwab, and Ronald C. Reeve.
ASCE Proceedings, Journal of the Irrigation and Drainage Division, Vol 96, No IR 4, p 437-449, December 1970. 13 p, 10 fig, 1 tab, 8 ref, append.

Descriptors: *Subsurface drains, *Tile drains, *Sediment control, Velocity, Sediment transport, Sedimentation, Silting, Filters, Sands, Analog models, Hydraulic models.
Identifiers: Drain sedimentation.

Sediment inflow into subsurface drains in noncohesive soils may be alleviated by using an impervious cover over a drain having inflow openings only at the top. Water flows between the cover and the outer drain surface in an upward direction before entering the openings at the top of the drain. Sediment inflow is prevented if the flow velocity is less than the critical boiling velocity. In this paper the shape of the upflow channel openings and the velocity distribution across the openings are evaluated. Terzaghi's concept of effective stress is the basis for the theoretical velocity distribution. An electric analog model was employed to verify this theory. A laboratory model was used to determine critical velocities. Critical boiling velocities for fine sand and glass beads are about 1% of Stoke's settling velocity. Within reasonable limits the upflow channel width and shape can be designed to prevent movement of sediment. High water tables have the greatest influence on velocity. (Knapp-USGS)

5A. Identification of Pollutants

ATMOSPHERIC TECHNETIUM-99,
East Texas State Univ., Commerce. Dept. of Chemistry.
Moses Attrep, John A. Enochs, and Larry D. Broz.
Environmental Science and Technology, Vol 5, No 4, p 344-345, April 1971. 2 p, 1 tab, 4 ref.

Descriptors: *Trace elements, *Rain water, *Radioisotopes, *Radiochemical analysis, Test procedures, Atmosphere, Water chemistry.
Identifiers: *Technetium-99.

Technetium-99 was isolated from 13 rain samples collected in 1967. The sizes of these samples were 53.5 to 233 liters. The concentrations of Tc-99 varied from 0.14 X 10 to the minus 2 to 1.7 X 10 to the minus 2 pCi/liter. Radioactive measurements were conducted on a Tracerlab Omniguard Low Level Beta Counter. The background of the counting system was about 0.3 cpm. Identification of the Tc-99 activity is based on indirect evidence. The observed activity in the rain samples followed the chemistry of technetium. Because the activities of these samples were low, and the half-life is so long, customary identification is impossible. Samples were counted for over two years with no decrease in activity. Since the availability and use of this fission produced nuclide have increased in recent years, Tc-99/is becomming widespread both in the atmosphere and in the natural water system. (Woodard-USGS)

CONTINUOUS MONITORING OF WATER SURFACES FOR OIL FILMS BY REFLECTANCE MEASUREMENTS,
Shell Development Co., Emeryville, Calif.
Alvin D. Goolsby.
Environmental Science and Technology, Vol 5, No 4, p 356-357, April 1971. 2 p, 3 fig, 1 ref.

Descriptors: *Oil, *Oil-water interfaces, *Monitoring, *Oil wastes, *Water pollution sources, Laboratory tests, Test procedures, Light, Refractivity, Prototype tests, Effluent streams, Industrial wastes.
Identifiers: *Oil film monitoring.

Laboratory experimentation and plant tests show that the use of reflectance measurement is a promising means of continuously monitoring water surfaces for oil contamination. The instrument resulting from these experiments in both simple and sensitive and can be used as a qualitative analyzer which would sound an alarm if oil slicks of significant size are detected. A laboratory arrangement consisting of an incandescent lamp, collimating lens, and photodetector was used to generate a light beam incident on a water surface and to measure the intensity of the reflected beam. The measured average intensity, using an angle of incidence of 30 deg increased 100% when a drop of 'waste oil' was introduced on the water. The actual intensity increase is significantly greater than the calculated value. This is possibly due to multiple internal reflections and light absorption in the oil film because thin films of oil on water give rise to more reflected light than very thick films. A prototype oil film monitor was constructed for tests of the reflectance principal in a refinery effluent stream. (Woodard-USGS)

THE QUANTITY, COMPOSITION AND DISTRIBUTION OF SUSPENDED PARTICULATE MATTER IN THE GULF OF CALIFORNIA,
Scripps Institution of Oceanography, La Jolla, Calif.
B. Zeitzschel.
Marine Biology, Vol 7, No 4, p 305-318, December 1970. 14 p, 15 fig, 6 tab, 48 ref. Bur Commercial Fisheries Contract 14-17-0007-963.

Descriptors: *Suspended load, *Seston, *Sea water, Organic matter, Silts, Sediment load, Suspension, Primary productivity, Nutrients, Instrumentation, Mineralogy, Plankton, Analytical techniques, Sampling.
Identifiers: *Gulf of California.

The quantity and quality of suspended particulate matter were estimated in 34 samples from the euphotic zone of 9 stations in the Gulf of California. The results from electronic, microscopic and chemical analyses showed that most parameters measured were significantly correlated. The total particulate volume from particles of 2 to 150 microns diameter, as obtained from the Coulter Counter, were significantly related to such parameters as seston, particulate nitrogen, particulate carbon, phytoplankton carbon and chlorophyll a. The Coulter Counter can be a very useful instrument to determine, with little effort, the size, distribution, and volume of particulate suspended matter in the sea. These data can then be used to calculate some important biological parameters which are necessary to establish meaningful models of phytoplankton production. (Knapp-USGS)

STABLE CARBON ISOTOPE RATIOS AS INDICES OF PETROCHEMICAL POLLUTION OF AQUATIC SYSTEMS,
Texas Univ., Port Aransas. Inst. of Marine Science.
John A. Calder, and Patrick L. Parker.
Environmental Science and Technology, Vol 2, No 7, p 535-539, July 1968. 5 p, 2 fig, 4 tab, 10 ref.
NSF Grants GA-299 and GA-911.

Descriptors: *Pollutant identification, *Water pollution sources, *Stable isotopes, *Oil wastes, *Surface waters, Carbon, Organic matter, Oil industry, Oily water, Streams, Texas, Analytical techniques, Methodology, Spectrophotometry, Water quality.
Identifiers: *Carbon isotope ratios.

Variations in the C-13/C-12 ratio of dissolved and particulate organic matter from several aquatic systems were investigated. These measurements were made for natural and organic chemically polluted systems. Delta C-13 natural systems ranges between -14 and -23 relative to the National Bureau of Standards isotope reference material No. 20. Petrochemical products and petrochemical effluents are much more depleted in C-13 with a range from -25 to -49. Delta C-13 of the dissolved organic matter was measured for 15 samples from the Houston, Tex., Ship Channel. Model calculations based on these data suggest that the C-13/C-12 ratio of dissolved organic matter may serve as a quantitative index of petrochemical pollution. The studies described are the test of the idea that stable isotope ratios may serve as a useful index of organic pollution of aquatic systems. The data suggest that this is the case. (Woodard-USGS)

WATER QUALITY MONITORING FIELD STUDIES,
Bruce R. Barrett.
Paper presented at the Calif Water Pollution Control Assoc 42nd Annual Conference, Sacramento, Calif, April 29 to May 1, 1970.

Descriptors: *Monitoring, *On-site investigations, *Instrumentation, Water pollution, Sources, Water quality.

Continuous water quality monitors have been used by the Technical Services Program of the Robert S. Kerr Water Research Center, Ada, Oklahoma, in a variety of field water pollution studies and for various purposes. Two commercially available types of monitors have been used. Monitors were used in the James River Project along with recording flow gages to determine the relationship between stream quality and storm runoff. In a before-and-after type study to determine differences in quality due to navigation impoundments, monitors were used to establish the existing quality of the waterway. In a research study of a refinery waste treatment plant, a monitor was used to study the various unit processes for purposes of treatment control and overall refinery waste monitoring. The sample taking capability of the monitors was indispensable in an enforcement case involving a mine waste.

WATER QUALITY AT PATUXENT RIVER BRIDGE, MARYLAND - JANUARY 1968 THROUGH NOVEMBER 1969,
Geological Survey, Arlington, Va.
Robert L. Cory, and Jon W. Nauman.
Geological Survey Open-file Report, 1971. 51 p, 8 fig, 1 tab, 16 ref.

Descriptors: *Water quality, *Estuaries, *Maryland, *Monitoring, Hydrological data, Data collections, Sampling, Stream gages, Water level fluctuations, Primary productivity, Water pollution effects, Nutrients, Sewage, Water pollution sources, Thermal pollution, Tides, Dissolved oxygen, Turbidity.
Identifiers: *Patuxent Estuary (Md).

An 8-parameter water quality monitor was operated on the Patuxent estuary, Maryland, from October 1963 to December 1969. Surface temperatures over the entire period ranged from -1.1 deg to 32.0 deg C. The effects of thermal discharges from a steam electric station located 6.5 KM upstream were slight and detectable only during the late phase of the ebb tide. The lowest annual average salinity was recorded during 1968. The 1969 salinity record was unusual in that no springtime low in salinity occurred because of an early spring rainfall deficiency. Turbidity ranged from about 7 to 170 JCU. Diurnal records of dissolved oxygen in the summer of 1968 and 1969 reflected the oxygen produced by phytoplankton stimulated from upstream domestic waste discharges. Average daily gross primary plant production increased 20%. The mean range of tide was 1.9 feet with an extreme range of 6.1 feet during 1968 and 1969 as compared to 6.7 for the 4 previous years. MERCURY CONTENT OF ILLINOIS COALS,
Illinois State Geological Survey, Urbana.
R. R. Ruch, Harold J. Gluskoter, and E. Joyce Kennedy.
Illinois Geological Survey Environmental Geology Notes, No 43, February 1971. 15 p, 6 fig, 4 tab, 7 ref.

Descriptors: *Pollutant identification, *Heavy metals, *Trace elements, *Coals, Coal mines, Pyrite, Methodology, Analytical techniques, Chemical analysis, Laboratory tests, Mineralogy, Neutron activation analysis.
Identifiers: *Mercury.

Fifty-five raw coal samples from 10 coal seams in Illinois have a mean mercury concentration of 0.18 part per million and a mode that lies between 0.10 ppm and 0.12 ppm. Eleven coal samples from states other than Illinois have mercury concentrations within the same range as Illinois coals, or slightly lower. The neutron activation method used for the determination of mercury in coal, developed at the Illinois State Geological Survey, has a sensitivity of approximately 0.01 ppm and a precision of about 20 percent. Three coal samples were individually separated into specific gravity fractions in the laboratory, and all exhibited a mercury reduction of at least 50 percent in the lightest coal fraction and a concentration of mercury in the heaviest fraction. A more detailed study of a single coal sample suggests that a significant part of the mercury is associated with the pyrite in the coal, and the remainder (perhaps up to 50 percent) is in organic association. DETERMINATION OF SOME CHEMICAL AND PHYSICAL RELATIONSHIPS FROM RECORDING METERS IN LAKES,
Ontario Water Resources Commission, Toronto.
Merv D. Palmer, and J. Bryan Izatt.
Water Research, Vol 4, No 12, p 773-786, December 1970. 14 p, 6 fig, 9 tab, 9 ref.

Descriptors: *Path of pollutants, *Monitoring, *Water quality, *Lakes, *Lake Erie, Water pollution sources, Water pollution effects, Pollutant identification, Instrumentation, Statistical methods, Current meters, Dissolved oxygen, Hydrogen-ion concentration.
Identifiers: *Water quality monitoring.

Hourly readings of current, conductivity, pH and dissolved oxygen were collected during May and June, 1969, 1.6 km offshore at the mid-depth of a total depth of 6 m on Lake Erie. The nearest major sewage outfall is 6 km to the west of the measuring location. Data collected in this manner requires extensive conditioning before meaningful time series analytical techniques are applied. Conductivity was found to correlate directly with water movement in the nearshore areas of lakes, and is considered to be transported by the currents. pH was related to currents for one month only. Dissolved oxygen is independent of currents and requires information other than currents to explain the measured values. Probability techniques were successfully used to describe conductivity, pH and dissolved oxygen. (Knapp-USGS)

A COLORIMETRIC METHOD FOR AMMONIA IN NATURAL WATERS,
Council for Scientific and Industrial Research, Pretoria (South Africa). National Inst. for Water Research.
J. E. Harwood, and A. L. Kuhn.
Water Research, Vol 4, No 12, p 805-811, December 1970. 7 p, 1 fig, 2 tab, 22 ref.

Descriptors: *Chemical analysis, *Water analysis, Colorimetry, *Nitrogen, *Ammonia, Pollutant identification, Trace elements, Water pollution, Water quality.
Identifiers: *Ammonia determination.

An improved phenol-hypochlorite method for determining ammonia in water uses nitroprusside as catalyst. The method is simple, sufficiently sensitive for low-level analyses and does not require accurate time intervals between reagents, nor expensive equipment. The method is well suited for routine use. Beer's Law was obeyed over the whole ammonia range investigated. Reproducibility was 1.3 percent with 10 micrograms N and 5.7 percent with 1 microgram N. (Knapp-USGS)

DIELDRIN AND ENDRIN CONCENTRATIONS IN A LOUISIANA ESTUARY,
Ogden Coll. of Science and Technology, Bowling Green, Ky, and Oklahoma Univ., Norman. Dept. of Civil Engineering and Environmental Science; and Franklin Inst., Boston, Mass; and Riverside Research Labs., La Chasse, La.
D. R. Rowe, L. W. Canter, P. J. Snyder, and J. W. Mason.
Pesticides Monitoring Journal, Vol 4, No 4, p 177-183, March 1971. 7 p, 3 fig, 7 tab, 10 ref. PHS Grant No 1 RO 1 UI 00346-01.

Descriptors: *Estuaries, *Louisiana, *Dieldrin, *Endrin, *Pesticide residues, Bottom sediments, Water quality, Bioassay, Water pollution sources, Mississippi River.
Identifiers: *Mississippi River Delta.

The endrin and dieldrin concentrations were determined in water, bottom sediment, and oysters in an estuarine area of Louisiana. Sampling was conducted on approximately a semimonthly basis from October 1968 through May 1969 in Grand Bayou, Hackberry Bay, and Creole Bay. Creole Bay is about 14 miles above the Gulf of Mexico. Samples of oysters, sediment, and water were analyzed for residues of dieldrin and endrin using electron capture gas chromatography. Identification was made first on a nonpolar column and then on a polar column. The median concentration of dieldrin and endrin in oysters was 1.3 ppb and less than 1 ppb, respectively, while the maximum concentration was 3.4 ppb and 2.4 ppb. Water samples from all stations on every sampling date contained less than 1 ppb of both dieldrin and endrin; the highest level of dieldrin detected in the bottom sediment was 4 ppb, and the maximum concentration of endrin was less than 5 ppb. (Knapp-USGS)
W71-06460

CHLORINATED HYDROCARBON PESTICIDES IN IOWA RIVERS,
Iowa Univ., Iowa City. State Hygienic Lab.
Lauren G. Johnson, and Robert L. Morris.
Pesticides Monitoring Journal, Vol 4, No 4, p 216-219, March 1971. 4 p, 4 tab, 9 ref.

Descriptors: *Chlorinated hydrocarbon pesticides, *Iowa, *Rivers, Dieldrin, DDT, Pesticide residues, Path of pollutants, Water pollution sources, Runoff, Mississippi River Basin.

The routine monitoring of a number of Iowa rivers for chlorinated hydrocarbon pesticides over a 3-year period has shown the presence of dieldrin, DDT, or DDE in the majority of the samples taken. Dieldrin has occurred more frequently and in higher concentrations than either of the other residues, and this is attributed to the amount of agricultural activity in the watersheds involved and to the amount of surface water runoff. (Knapp-USGS)

MONITORING ECOLOGICAL CONDITIONS ASSOCIATED WITH WIDE-SCALE APPLICATIONS OF DMA 2,4-D TO AQUATIC ENVIRONMENTS,
Tennessee Valley Authority, Muscle Shoals, Ala. Div. of Environmental Research.
T. A. Wojtalik, T. F. Hall, and Larry O. Hill.
Pesticides Monitoring Journal, Vol 4, No 4, p 184-203, March 1971. 20 p, 4 fig, 14 tab, 12 ref, 4 append.

Descriptors: *Herbicides, *Pesticide residues, *Reservoirs, *Alabama, *Tennessee, Aquatic weed control, Water quality, Bioassay, Water pollution sources, Tennessee River, Tennessee Valley Authority Project.
Identifiers: Eurasian Milfoil, Nickajack Reservoir, Guntersville Reservoir.

Over 18,000 surface acres of Nickajack and Guntersville Reservoirs, Alabama and Tennessee, were treated with about 170,000 gallons of dimethlamine salt of 2,4-D during April-June 1969 to control invading Eurasian watermilfoil. The DMA 2,4-D was applied at the rates of 20 and 40 lb of 2,4-D acid equivalent per acre. Representative habitat types were selected and monitored for 2,4-D content in water, plankton, and sediment and for plankton species composition, distribution, abundance, change, and response. The treated water had no apparent effects on most marginal plants. No harmful response to the herbicide was observed in zooplankton, phytoplankton, benthic macroinvertebrates, or fish. Water continued to be used for domestic purposes without user complaints. Dimethlamine salt of 2,4-D appears to be noncumulative. Plankton sorbed large amounts and retained it for extended periods. Finished drinking water from municipal treatment plants on occasion contained 2,4-D. (Knapp-USGS)
W71-06462

THE DECOMPOSITION OF CRUDE OIL RESIDUES IN SAND COLUMNS,
Marine Lab., Aberdeen (Scotland).
R. Johnston.
Journal Marine Biology Association of the United Kingdom, Vol 50, No 4, p 925-937, 1970. 13 p, 5 fig, 8 ref.

Descriptors: *Oily water, *Beaches, *Sands, *Biodegradation, Path of pollutants, Water pollution effects, Surf, Oxidation, Model studies, Laboratory tests.
Identifiers: *Oil spills, *Oily beaches.

Rates of oxygen uptake were measured at a range of depths in sand columns (1) without oil, (2) heavily oiled and (3) lightly oiled. Oxygen change in presence of oil indicates the response of the microbial population and provides an estimate of the rate of biological degradation of the crude oil. Breakdown is dominated by oxygen availability but nutrients contribute as auxiliary oxygen sources. Oxygen removal indicates initial rates of oxidation of oil at 10 deg C ranging from 0.09 g oil per sq m per day for heavily dosed sand to 0.04 g oil per sq m per day for lightly dosed sand. These rates are applicable over periods of several months, thereafter the remaining oil, about 90%, decays immeasurably slowly. (Knapp-USGS)

Soil Science, Vol 107, No 4, p 281-288, 1969. 8 p, 5 fig, 2 tab, 10 ref.

Descriptors: *Water pollution sources, *Soil treatment, *Saturated soils, *Phosphates, *Louisiana, Ionization, Soils, Ion exchange, Soil-water-plant relationships, Inorganic compounds, Testing, Methodology, Test procedures, Soil analysis, Water quality, Soil water, Soil types, Acidic soils, Akaline soils, Soil properties, Fertilizers, Crops, Rice.
Identifiers: Waterlogged soils.

The distribution of various forms of soil phosphate in each of 16 soil types both before and after two months of waterlogging was studied. The more acid soils had a larger fraction of their inorganic phosphate in the forms of aluminum phosphate and iron phosphate while calcium phosphate was highest in the less acid soils. Aluminum phosphate increased as a result of waterlogging in most of the soils. In the finer textured soils, however, aluminum phosphate generally decreased as a result of waterlogging. As an average for all soils, there was an approximate 35% increase in aluminum phosphate due to waterlogging. Iron phosphate also increased as a result of waterlogging in all soils except the Commerce. The average increase was 64%. Part of the increase in iron phosphate was apparently at the expense of reductant soluble iron phosphate although, in the Commerce and two other recent alluvial soils, part of the increase in iron phosphate apparently came from calcium phosphate. MOVEMENT OF 2,4-D IN SOILS,
New Mexico Agricultural Experiment Station, University Park.
H. E. Dregne, S. Gomez, and W. Harris.
New Mexico Agricultural Experiment Station Western Regional Research Project Progress Report, November 1969. 35 p, 21 fig, 8 tab, 41 ref.

Descriptors: *Water pollution sources, *Herbicides, *New Mexico, *Soil water movement, Groundwater, Surface waters, Testing, Test procedures, Methodology, Water quality, Soils, Pesticides, Chromatography, Adsorption, Chemical analysis, Analytical techniques, Bioassay, Soil structure, Infiltration, Soil properties, Leaching, Path of pollutants.

Movement of 2,4-dichlorophenoxyacetic acid (2,4-D) in three soils was studied to determine the extent to which herbicides applied in the field enter the surface and groundwater systems. Analytical techniques used included gas chromatography, thin layer chromatography, soil thin layer chromatography, resin thin layer chromatography, bioassays, and autoradiography. Primary emphasis was placed upon the effect of exchangeable cations on 2,4-D movement. Adsorption isotherms, breakthrough curves, leaching studies, and bioassays indicate that 2,4-D in the acid or salt form, is only slightly adsorbed by soil particles. It is easily leached if the soils are permeable. Virtually 100% of applied 2,4-D was recovered from a sandy loam in six and one-half hours of leaching. Only 38% was recovered from a slowly permeable silty clay loam over a period of ten months. Degradation products of 2,4-D were leached as easily as 2,4-D itself. (Woodard-USGS)

THE PATUXENT RIVER, REPORT NO 4, PHYSICAL, CHEMICAL AND BACTERIOLOGICAL WATER QUALITY - SUMMER SURVEYS, 1964-1966,
Maryland Dept. of Water Resources, Baltimore. Div. of Water Quality Investigations.
James T. Allison.
Maryland Division of Water Quality Investigations Report, 1968. 70 p, 11 fig, 6 tab, 9 ref, 5 append.

Descriptors: *Water pollution sources, *Rivers, *Water quality, *Maryland, Industrial wastes, Domestic wastes, Data collections, Land use, Chemical analysis, Methodology, Streamflow, Discharge measurement, Runoff, Coliforms, Dissolved oxygen, Biochemical oxygen demand, Water temperature, Precipitation (Atmospheric), Dissolved solids, Turbidity, Color, Acidity.
Identifiers: *Patuxent River (Md).

Water-quality data obtained during the three summer surveys of 1964, 1965, and 1966 on a 21-mile stretch of the Patuxent River in Maryland are presented. Sampling stations were located between Rocky Gorge Reservoir and the John Hanson Highway (U.S. 50 and 301) crossing of the Patuxent River. Samples were examined regularly for 10 chemical, physical and bacteriological qualities of water which reflect the condition and capacity of the river to assimilate any wastes it receives. Flow measurements were made daily at three sampling stations. Emphasis is placed on dissolved oxygen (D.O.), biochemical oxygen demand (B.O.D.), coliform bacteria, and stream flow as the critical factors in the assessment of water quality. In 1966 serious degradation of water quality with respect to D.O. was noted throughout the lower 15 miles of the study area with maximum stress in the lower reaches where D.O. as low as 1.0 ppm was recorded. Stream flow, which is the greatest single factor controlling the overall waste-assimilative capacity of surface water, decreased from year to year. (Woodard-USGS)

FECAL COLIFORM CONCENTRATIONS IN STORMWATERS,
Robert A. Buckingham, and Roger P. Betson.
Paper presented at the Amer Geophys Union, Fifty-first Annual Meeting, 1970.

Descriptors: *Storm runoff, *Coliforms, *Overland flow, *Water quality, *Water pollution sources, *Testing.
Identifiers: *Fecal coliforms, *Tennessee Valley.

Recent limited stormwater bacteriological water-quality sampling in the Tennessee Valley indicates that high fecal coliform loads are common in stormwater runoff. In clean residential areas sustained high fecal coliform loads were observed during stormwater runoff. The source of these loads was associated with overland flow, and it appears that staggered contributing times account for the sustained high loads. High fecal coliform counts were also measured in stormwaters originating from agricultural areas and forested watersheds. The consistency with which fecal coliform counts in excess of accepted standards are commonly found further substantiates the need for a reappraisal of this test as an indicator of pathogenic organisms. These data also point to the importance of recognizing the streamflow regime in the analysis of water-quality sampling data since observations taken during storm periods usually in high bacteriological loads.
W71-06570

SEASONAL VARIATIONS IN SURVIVAL OF INDICATOR BACTERIA IN SOIL AND THEIR CONTRIBUTION TO STORMWATER POLLUTION,
D. J. Van Donsel, E. E. Geldreich, and N. A. Clarke.
Appl Microbiol, Vol 15, No 6, p 1362-1370, 1967.

Descriptors: Streptococcus, E. coli, Bioindicators.
Identifiers: Seasonal survival study.

A three-year study was made on the survival of selected strains of Escherichia coli and Streptococcus faecalis in shaded and exposed out-door soil plots. The soils were dosed periodically, and subsequent reductions in survival are shown graphically as seasons variate. Periods for 90-per cent reduction of Esch. coli ranged from 3.3 days in summer to 13.4 days in autumn and for S. faecalis from 2.7 days in summer to 20.1 in winter. During the fall, the survival periods for the organisms were the same, but in spring and winter Streptococcus survived longer. Both organisms could be isolated from runoff during period of heavy rainfall in spring; however, isolation during summer and autumn months was sporadic. On account of these results and other factors, it was considered that Esch. coli was the better indicator of pollution.
W71-06571

THE BACTERIOLOGICAL ASPECTS OF STORM-WATER POLLUTION,
E. E. Geldreich, L. C. Best, B. A. Kenner, and D. J. Van Donsel.
Journal Water Pollution Control Federation, Vol 40, No 11, p 1861-1872, Nov 1968.

Descriptors: *Water pollution sources, *Pollutant identification, Remedies.
Identifiers: *Fecal coliforms.

The bacteriological composition of stormwater from a variety of areas was compared and seasonal differences noted. Higher numbers of organisms appear to persist during winter than during summer. The fecal coliform segment of the total coliform population for all stormwater samples averaged 8.6 percent; however, 21.1 percent fecal coliforms were observed in stormwater taken in autumn from a suburban business district. Evidence indicates that fecal contamination in separate stormwater systems originates from cat and dog deposits on soil and from rodent deposits in urban areas. Thus, regulations to prohibit pets on public beaches and improved garbage control plans to discourage rodent proliferation are recommended. Also, diversion of storm drains and land drainage away from beaches and reservoirs would aid in reducing bacterial contamination.
W71-06572

ON SIGNIFICANCE OF PSEUDOMONAS AERUGINOSA IN SURFACE WATERS,
A. W. Hoadly.
Journal of the New Eng Water Works Association, Vol 82, No 2, p 99-111, Jun 1968.

Descriptors: *Pseudomonas, *Drainage, Indicators.
Identifiers: *Pseudomonas aeruginosa.

Although sewage discharges represent major potential sources of P. aeruginosa in the environment, storm drainage from municipal areas contributes continuous inoculum to surface waters. Farm drainage also can contain small numbers of bacteria under certain conditions. Relatively heavy populations of P. aeruginosa in streams below sewage outfalls decrease rapidly as they progress downstream. The usefulness of this organism as an indicator of the possible presence of enteric pathogens is therefore limited.
W71-06573

THE OCCURRENCE AND BEHAVIOR OF PSEUDOMONAS AERUGINOSA IN SURFACE WATERS,
A. W. Hoadley.
Thesis, University of Wisconsin, 1967, Diss Abstr, Vol 28B, p 459-460, 1967. 224 p.

Descriptors: *Pseudomonas, *Indicators, *Storm runoff, *Water pollution sources, *Surface waters, Drainage, Sewage.
Identifiers: *Pseudomonas aeruginosa.

Studies on the ecology of Pseudomonas aeruginosa in surface and tap waters and on its usefulness as an indicator of pollution showed that Pseudomonas probably does not occur in waters unaffected by the activities of man and domestic animals. Although farm drainage and storm runoff from urban areas contribute small numbers of Pseudomonas, sewage discharges probably represent the major source of these organisms entering streams, particularly discharges of crude sewage which may contain up to 700,000 organisms per 100 ml. Although secondary sewage treatment reduces the number of Pseudonomas in domestic sewage by about 99 per cent, growth of the organism has been observed during treatment of slaughterhouse waste waters. Populations of less than 100 per 100 ml occurred in surface waters near areas of human activity but not directly receiving sewage discharges; however, populations of about 100 per 100 ml were detected in public bathing waters in the Madison Lakes, Wis., and very much greater populations were observed in waters recently contaminated with sewage. Although some sterile natural waters supported growth of Pseudonomas in the laboratory, populations of viable Pseudonomas were reduced rapidly in natural surface waters, with reductions of more than 90 percent in three hours. It is concluded that Pseudonomas aeruginosa is a sensitive indicator of pollution of surface waters by sewage and by runoff from urban areas and farmyards.

URBAN RUNOFF ADDS TO WATER POLLUTION.

Environ Sci Technol, Vol 3, No 6, p 527, Jun 1969.

Descriptors: *Runoff, *Data collections, *Cost analysis, *Surveys, *Separation techniques, Rainfall, Overflow, Biochemical oxygen demand.
Identifiers: *Urban runoff, *Chicago, Combined sewers.

An APWA survey indicated that: (1) urban runoff constitutes approximately 1% of the raw sewage load which amounts to 5% of the BOD discharged from the area's secondary waste treatment facilities; (2) water pollution from this urban source occurs creating a shock pollution load on receiving waters; (3) the most determinable measure of pollution potential of street litter is the BOD load of the soluble dust and dirt fraction; (4) an estimated expenditure of $48 billion would be needed to

eparate sanitary and storm waters; and, (5) $15 illion would be needed for alternate control ethods for abatement of combined sewer over-ows.

SYMPOSIUM ON SEA-LEVEL CANAL BIOENVIRONMENTAL STUDIES.
Battelle Memorial Inst., Columbus, Ohio.

Available as BMI-171-28 from NTIS, Springfield, Va 22151, $3.00 printed copy, $0.95 microfiche. Martin, William E., Editor. Proceedings of the 19th Annual Meeting of American Institute of Biological Sciences, September 4-5, 1968, Ohio State University, Columbus: Battelle Memorial Institute, Columbus Laboratories, April 21, 1969. 196 p. USAEC Contract No AT (26-1)-171.

Descriptors: *Panama Canal, *Nuclear engineering, *Nuclear explosions, *Excavation, *Canals, Water pollution sources, Ecology, Fallout, Radioactivity, Public health.
Identifiers: *Panama, *Nuclear excavation.

Bioenvironmental studies were made to help judge the radiological-safety feasibility of nuclear-excavation plans for the construction of a sea-level canal across the isthmian region of Central America. As part of the program to predict potential external and internal radiation doses to human populations living in the vicinity of the proposed sea-level canal routes, extensive field studies of human, agricultural, terrestrial, freshwater, and marine ecology were made in eastern Panama and northwestern Colombia. An ecological model shows radionuclide transfer through food chains and other environmental pathways leading to man. The model provides calculations of the kinds and quantities of radionuclides to be expected, during and after nuclear excavation, in the external environments and diets of populations in the two study areas. Estimates of potential radiation doses to man will be based on these calculations. (See also W71-06715 thru W71-06718) (Knapp-USGS)

RADIONUCLIDE PRODUCTION FOR THE NUCLEAR EXCAVATION OF AN ISTHMIAN CANAL,
Battelle Memorial Inst., Columbus, Ohio.
James R. Vogt.
In: Symposium on Sea-Level Canal Bioenvironmental Studies. Paper 2, April 21, 1969. 6 p, 4 tab.

Descriptors: *Panama Canal, *Nuclear engineering, *Nuclear explosions, *Excavation, *Canals, Water pollution sources, Ecology, Fallout, Radioactivity, Public health.
Identifiers: *Panama, *Nuclear excavation.

The preliminary concept for the construction of a sea-level canal using nuclear explosives is discussed with reference to the number and sizes of nuclear devices that may be required and the characteristics of these devices. The factors affecting radionuclide production and distribution are described along with some recent nuclear experiments conducted by the U. S. Atomic Energy Commission to provide technical data on cratering mechanisms and special emplacement techniques which could minimize the release of radioactivity to the atmosphere. The quantities of radioactivities which would be released into the cloud and local fallout for major excavation projects, using nuclear technology which can reasonably be expected to be available sometime in the future, are presented for a representative set of radionuclides. THE RETENTION OF SELECTED RADIONUCLIDES FROM DILUTE SOLUTIONS BY PANAMANIAN CLAYS,
Florida Univ., Gainesville. Dept. of Environmental Engineering; and Florida Univ., Gainesville. Inst. of Food and Agricultural Sciences.
William A. Goldsmith, W. Emmett Bolch, and J. F. Gamble.
In: Symposium on Sea-Level Canal Bioenvironmental Studies, Proceedings of the 19th Annual Meeting of American Institute of Biological Sciences, September 4-5, 1968, Ohio State University, Columbus. Battelle Memorial Institute, Columbus Laboratories, Paper 12, April 21, 1969. 6 p, 3 fig, 1 tab.

Descriptors: *Adsorption, *Radioisotopes, *Fallout, *Path of pollutants, *Soil water movement, Clays, Clay minerals, Leaching, Ion transport, Panama Canal, Nuclear engineering, Nuclear explosions, Excavation.
Identifiers: *Panama, *Nuclear excavation.

The retention of the radionuclides Ca-45, Sr-89, Cs-137, and Rb-86 was determined for six selected Panamanian clays. The procedure used was that of a slurry test. Gamma emitters were counted by gamma spectroscopy; beta emitters were counted by liquid scintillation. The data have been plotted in a linearized version of the usual uptake or removal curves. The results indicate that all clays used have an ultimate uptake capacity of practically 100% of the applied radionuclides. However, the rate of uptake is markedly different for the various clays. A correlation between the rate of uptake and various clay properties is now being investigated. (See also W71-06714) (Knapp-USGS)

HYDROLOGIC REDISTRIBUTION OF RADIONUCLIDES AROUND A NUCLEAR-EXCAVATED SEA-LEVEL CANAL,
Isotopes, Inc., Palo Alto, Calif.
R. L. Charnell, T. M. Zorich, and D. E. Holly.
In: Symposium on Sea-Level Canal Bioenvironmental Studies, Proceedings of the 19th Annual Meeting of American Institute of Biological Sciences, September 4-5, 1968, Ohio State University, Columbus. Battelle Memorial Institute Columbus Laboratories, Paper 15, April 21, 1969. 12 p, 4 fig, 9 ref.

Descriptors: *Panama Canal, *Nuclear engineering, *Nuclear explosions, *Excavation, *Canals, Water pollution sources, Ecology, Fallout, Radioactivity, Public health.
Identifiers: *Panama, *Nuclear excavation.

The hydrologic redistribution of radionuclides deposited in the environment following nuclear excavation of a sea-level canal are discussed. Additionally, a simple comprehensive numerical model is presented by which estimates of the rates of removal of radionuclides from deposited fallout and from the ejecta and fallback can be made. Following a nuclear cratering explosion, a spectrum of rock fragments which contain radioactivity as fission and activation products will surround the excavation area. Dust and fine particles will be deposited further out as wind and base-surge distributed fallout. Following the initial deposition of radionuclides, redistribution will be accomplished primarily by the movement of water. Radioactive products may be moved from the initial point of deposition both as particles containing radioactive isotopes and as dissolved radionuclides leached from rubble and fallout material. Radioactive products may be moved either by surface or groundwater. (See also W71-06714) (Knapp-USGS)

POLLUTION OF THE CHAO PHRAYA RIVER,
R. E. Leffel.
J Sanit Eng Div, Am Soc Civil Engrs, Vol 94, No SA2, p 295-306, Apr 1968.

Descriptors: *Foreign research, Estuaries, Waste water treatment, Water pollution sources.
Identifiers: *Chao Phraya River, Thailand.

Programmed sampling and tests of the Chao Phraya River Estuary show that its pollution-receiving capacity is limited. No sewage collection system presently exists in Bankgok, but separate waste water and stormwater systems are being planned because a combined system would undoubtedly cause further pollution of the estuary during severe rainfall. More studies must be made before the degree of oxidation of organic carbon, nitrogen, and amoniacal nitrogen can be accurately determined. Further studies are also being conducted to decide upon the necessary type of initial waste water treatment. Such treatment must include sufficient oxidation of organic carbonaceous substances and oxidizable nitrogenous substances. This study also demonstrates the need for modifications in standard BOD measurements in addition to modifications of the parameters and equations defining DO concentrations for tropical estuaries.

WATER RESOURCES AS AN ELEMENT OF URBAN PLANNING,
M. L. Rockwell.
J Urban Planning Devel Div, Am Soc Civil Engrs, Vol 94, No UPI, p 1-9, Aug 1968.

Descriptors: *Water utilization, *Storm runoff, Reservoir storage, *Urbanization, Waste water treatment, Water pollution sources.

An examination is made of the complex technical, legal, and administrative problems involved in northeastern Illinois' water situation and the high degree of use and reuse taking place in this area. Even stormwater runoff along with its pollutants is retained in reservoirs to be used later beneficially. Existing problems related to stormwater runoff in this area include the restriction of water infiltration and, thus, the production of increased runoff caused by the construction of impermeable surfaces (roof tops, streets, and parking lots), and the maintenance of unsightly stormwater basins in areas where water recreational facilities are needed.

A COMPREHENSIVE SURVEY OF INDUSTRIAL WASTE POLLUTION IN SOUTH CAROLINA,
Texas A and M Univ., College Station.
Roy W. Hann, Jr., and F. D. Callcott.
Proceedings, Twentieth Industrial Waste Conference, May 4-6, 1965, Purdue University, Lafayette, Ind, p 538-550, July 1965. 8 fig, 1 tab, 7 ref.

Descriptors: *Industrial wastes, Biochemical oxygen demand, *South Carolina, Cotton, Textiles, Waste water treatment.
Identifiers: *Cotton wastes, Slashing wastes, *Wool scouring, Dyehouse wastes, *Textile mill wastes, Man-made fiber plants, Desizing.

The nature and magnitude of pollutants being discharged into South Carolina rivers by each industrial group, the location of the discharges, and the industrial processes that give rise to such waste discharges are summarized in this paper. In inland streams textiles contribute 10 times the pollutional load of its nearest competitor, the pulp and paper industry. Cotton wastes, presenting the major pollution problem, come from fiber preparation, bleaching, and finishing. Some wastes are directly toxic to aquatic life; high biochemical oxygen demand is indirectly toxic. Only 10% of the grey goods manufacturers in South Carolina treat their wastes in any way, and few finishing plants separate their process wastes for treatment. Wool processing wastes come primarily from the scouring chain. Those synthetic fibers made of natural substances cause more pollution than do nylon, orlon, or fiberglass - non-natural fibers. THERMAL EFFECTS AND NUCLEAR POWER STATIONS IN THE USA,
Argonne National Lab., Ill.
D. Miller, J. V. Tokar, and R. E. Nakatani.
Available from NTIS as CONF-700810-30, $3.00 in paper copy, $0.95 in microfiche. Conference paper CONF-700810-30 (IAEA-SM-146/30), 1970. 14 p.

Descriptors: *Nuclear power plants, *Water temperature, *Ecosystems, *Cooling water, Heated water.
Identifiers: *Steam power plants.

Steam-electric stations discharging heated co
denser cooling water into public waters will modi
the aquatic environment. There is no question th
some changes will occur, but the biologic
problem is to determine the degree of change
both short-term and long-term, the extent of the
changes, and to determine if they significantly a
fect water uses. Pressing biological problems a
identified and needed research and developme
are recommended. Examples of problems co
sidered are as follows: (1) Compliance with wat
temperature standards. (2) Lack of definition
mixing zones. (3) Lack of approved state wat
temperature standards. (4) Predicting temperatu
distributions in receiving water. (5) Assessment
biological changes. (6) Design of intake and outfa
structures to minimize biological damage -- fi
protection facilities. (7) Nuisance growth of plan
and algae. (8) Sublethal effects of temperature c
aquatic life.

ment filtrate, Hydraulic fracturing fluid, Cationi
quaternary, Alkylbensyl-trimethyl ammoniu
chloride, Clay swelling.

Bacterial contamination of a producing well fro
drilling mud or fracture fluid has been overlooke
for many years in spite of our knowledge of bac
teria in connection with waterflooding operation
But the problem has finally been recognized, an
remedial action can be taken, if the right chemica
are used. Producing formations in wells drilled fo
the production of oil, gas, or water, are all subjec
to contamination because of contact with drillin
fluid, cement filtrate, and hydraulic fracturin
fluid. Most trouble in contamination cases can b
traced to one or two sources - sulfate-reducing bac
teria, or iron bacteria. Both of these are capable o
reducing permeability of a producing formatio
through deposition of their by-products, or throug
their presence in extremely large numbers. Havin
recognized the problem, the next step was to find
chemical that would solve it. After testing man
chemicals, it was found that a cationic quaternar
alkylbenzyl trimethyl ammonium chloride, wa
most effective. It is a bactericide. It behaves as
corrosion inhibitor because of its film-forming pro
perties. Its detergent properties aid in preventin
clay swelling, and it is a nonemulsifier. (Campbel

he design and operation of a simulated sanitary ndfill is described. The behavior of the model, a simeter, is best described as an aerobic state, followed by an anaerobic state. Sustained high pollution levels were measured in the leachate, with OD levels at approximately 20,000 mg/liter. (K-app-USGS)

IGNOSULPHONATES IN LAKE PAIJANNE ATER,
elsinki City Waterworks (Finland). Construction ept.
ppo Priha.
SCE Proceedings, Journal of the Sanitary Engineering Division, Vol 97, No SA2, Paper 8021, p 91-207, April 1971. 17 p, 6 fig, 2 tab, 12 ref.

escriptors: *Water pollution sources, *Lakes, Pulp wastes, *Sulfite liquors, Water treatment, ater quality, Water pollution, Water supply, Industrial wastes, Wood wastes, Organic wastes, Sulnates.
lentifiers: Lake Paijanne (Finland), Finland.

he water requirements of the city of Helsinki and s adjacent urban areas can be satisfied from the resent sources up to about 1978. In order to meet he demand from the 1980's on, water will be conveyed to Helsinki in a 120-km long rock tunnel om the southern end of Lake Paijanne, the cenal lake of the Kymi River basin. The total volume f the lake is approximately 17.3 billion cu m as easured from mean water level. Industrial and omestic waste waters are released into the lake nd water courses empty into it. These wastes are ostly made up of the effluents of pulp mills and he spent liquor from the cooking processes. The gnosulphonic acids in these wastes have spread ore or less over the whole lake and form an imortant factor in judging its water quality and suitaility as a supply for drinking water purification. he Water Examination Bureau at the Helsinki ity Waterworks has carried out water quality stuies on the lake since 1965. These studies include easuring lignosulphonate content at sampling staons in central and southern parts of the lake and arallel pilot plant treatment runs with Lake aijanne water and water from the present raw ater supply. HE INFLUENCE OF DECOMPOSING SALMON ON WATER CHEMISTRY,
laska Univ., College. Inst. of Water Resources.
ohn J. Goering, and David C. Brickell.
vailable from National Technical Information ervice as PB-198 431, $3.00 in paper copy, $0.95 n microfiche. Alaska Institute of Water Resources, ollege, Report No. IWR-12, 1971. 27 p, 7 fig, 3 ab, 8 ref. OWRR Project B-014-ALAS (1).

escriptors: *Salmon, Estuarine environment, Nutrients, Alaska, *Decomposing organic matter, Organic wastes, Industrial wastes, Water pollution ources, Ammonification, Nitrification.
dentifiers: Iliuliuk Bay (Alas).

he chemical dynamics of sea food waste decomposition and of salmon decomposition in a marine ystem were studied. A drastic increase in NH4 (..)-N and decrease in 02 occurred in the marine bay Iliuliuk Bay, Unalaska Island, Alaska) receiving ea food processing wastes. A seaward decreasing but elevated NH4 (..)-N suggests that this bay influences the nitrogen economy of the adjacent ocean. Salmon carcasses decomposition was followed in a spawning stream and its associated estuary (Little Port Walter, Alaska). Concentrations of NH4 (..)-N and organic -N in the water were determined in this system weekly, beginning before spawning and ending several months later. NH4 (..)-N and dissolved organic -N in the stream and estuary were low and unvariable before spawning. During spawning, NH4 (..)-N and organic -N increased downstream. As carcasses increased the NH4 (..)-N and organic-N became greater. Large increases of organic -N in the stream and estuary also resulted from salmon decomposition.

AN OIL DISPERSANT'S EFFECT ON THE MICROFLORA OF BEACH SAND,
Washington Univ., Seattle, Wash. Dept. of Zoology.
Stephen A. Bloom.
Journal Marine Biology Association of the United Kingdom, Vol 50, No 4, p 919-923, 1970. 5 p, 2 fig, 5 ref. NIH Grant.

Descriptors: *Oily water, *Water pollution control, *Water pollution treatment, *Detergents, Biodegradation, Water pollution effects, Beaches, Sands.
Identifiers: *Oil spills, *Oil-spill cleanup, Corexit 7664.

The effects of 'Corexit 7664', an oil dispersant, alone and in combination with oil in sand columns were determined by oxygen uptake, C-14 uptake, and chlorophyll analysis. 'Corexit' had no obvious deleterious effects within the experimental system under the conditions of periodic and continuous additions ranging from 500 ppm to 100,000 ppm and in combination with Kuwait crude oil. No change was observed in chlorophyll or C-14 uptake. Heightened oxygen uptake was noted for continuous addition of 'Corexit', for the oil control, and for oil plus 'Corexit'. Caloric content of the oil and oxygen uptake indicated an extended degradation period. (Knapp-USGS)

ON THE STAGNATION AND RECENT TURNOVER OF THE WATER IN THE BALTIC,
Fishery Board of Sweden, Goteborg. Hydrographic Department.
Stig H. Fonselius.
Tellus, Vol 22, No 5, p 533-544, 1970. 12 p, 13 fig, 3 ref.

Descriptors: *Eutrophication, *Salinity, *Density stratification, *Water circulation, *Water balance, Hydrologic budget, Nutrients, Turnovers, Water pollution effects, Path of pollutants.
Identifiers: *Baltic Sea.

The hydrography and water balance of the Baltic are described. Nutrients accumulate through runoff and decay of organic matter in the deep stagnant water, supplying the surface with organic matter, ammonia, nitrogen, and hydrogen sulphide. Oxygen has decreased in the Baltic deep water during the present century. An increased primary production in the surface water is predicted and a prognosis for the future development of the oxygen conditions in the Baltic is given. It is concluded that Man has increased the oxygen utilization in the deep water by the enormously increased discharge of untreated waste water from industries and communities and that the Baltic therefore has been 'overstrained.' Measures against future waste discharge must be taken to give the Baltic a chance to recover. (Knapp-USGS)

Identifiers: *Chesapeake Bay, *Patuxent River, Acetone, Cattail, Spartina, Indoleacetic acid.

Data on the hydrography, nutrient chemistry, primary production, standing crops of phytoplankton and zooplankton, and the effects of entrainment on the phytoplankton-bacteria community by a power plant in the upper Patuxent estuary are reported for the period August 1968 to August 1970. Carbon-14 uptake by the plankton under constant light ranged from 0.1 to 598 mg/cu m hr. Chlorophyll a values ranged from 0.1 to 120 mg/cu m. Maximum chlorophyll a and productivity values were measured in the oligohaline reaches where the salinity gradient was strongest. Locations above and below this region exhibited lower values. Calculated primary production ranged from 0.01 to 5.77 g/sq cm day and the spacial pattern was inversely related to turbidity and the volumetric measurements of productivity. Maximum penetration of high nutrient levels into the estuary occurred during the winter. Nutrient concentrations were high and comparisons with earlier published data indicate accelerated rates of nutrient input. Published information on intake-effluent studies showed that the power plant can cause a significant reduction in the standing crop and photosynthetic rates of entrained organisms. The effects of chlorination on entrained organisms may be more important than those of heat. We did not observe measurable effects of entrainment in the open river near the power plant. Preliminary studies were made on the species composition, chemical content, biomass and production of marsh vegetation. The total production of all the marshes in the study area was estimated at 23.3 x 2 million 330 thousand kg dry matter year of which 23,100 kg was nitrogen and 3900 kg was phosphorus. The study extended biomass data on some important zooplankton species, e.g., Eurytemora affinis.

ENVIRONMENTAL IMPACT OF POWER PLANTS,
Corps of Engineers, Fort Belvoir, Va. Operations Div.

Robert E. Donovan.
The Military Engineer, Vol 63, No 411, p 5-8, January-February 1971. 4 p, 4 fig, 1 tab.

Descriptors: *Nuclear power plants, *Environmental effects, *Water pollution sources, *Pollutant identification, *Electric powerplants, Thermal pollution, Air pollution, Radioactivity effects, Environment, Oxides, Reviews, Fish, Aquatic life, Thermal powerplants.
Identifiers: *Conventional powerplants.

Along with the need for added electrical power comes an increase in the potential for environmental pollution. Environmental effects in the immediate vicinity of the plant during normal operation are considered in this report. Gneralizations are made concerning the relative adverse ecological effects of nuclear and conventional power plants. Conventional plants cause less radioactive pollution, but radioactive releases are under strict control and their effect on the environment appears to be minimal. Conventional plants have a decided short-term advantage in thermal pollution. In those applications where thermal pollution of cold-water fisheries is critical, conventional plants have the advantage regardless of whether or not cooling towers and basins are used. This advantage probably will be largely eliminated in 5 to 10 years. (Woodard-USGS)

FISHERY MANAGEMENT PROGRAM, EXPANDED PROJECT FOR AQUATIC PLANT CONTROL-FIELD TEST AREAS - FINAL REPORT.
Bureau of Sport Fisheries and Wildlife, Atlanta, Ga. Div. of Fishery Services.

Bureau of Sport Fisheries and Wildlife Report, October 17, 1969. 88 p, 4 fig, 42 tab, 10 ref, append.

Descriptors: *Water pollution sources, *Herbicides, *North Carolina, *Louisiana, Surface waters, Toxicity, Testing, Methodology, Test procedures, Evaluation, Alligatorweed, Chemical analysis, Data collections.
Identifiers: *Herbicides (Silvex).

The effects of the herbicide Kuron (silvex) applications to alligatorweed on water quality and fish in surface waters of North Carolina and Louisiana are presented. Three treatments of Kuron (silvex) were applied at a rate of eight pounds acid equivalent per surface acre to alligatorweed at two study areas in North Carolina. Field observations indicated that silvex at the concentration applicable in treating alligatorweed was toxic to certain species of fish at one of the study areas. Laboratory analysis showed accumulations as high as 70 ppm in non-predator fish flesh. Invertebrates contained silvex residues in varying concentrations for more than seven weeks. Water and hydrosoil samples in most cases contained silvex residues for seven months after the last treatment. Three ponds in Louisiana collectively received a total of 13 Kuron treatments using the same application rate as used in North Carolina. Fish mortality occurred in seven of the thirteen treatments. Mortality was observed at all three ponds during the study. Laboratory analysis showed silvex accumulations as high as 19 ppm in non-predator fish and 16 ppm in predator fish. Silvex treatments changed the invertebrate composition. Water and hydrosoil contained silvex residues in varying concentrations. (Woodard-USGS)

A LABORATORY METHOD FOR THE STUDY OF MARINE BENTHIC DIATOMS,
Oregon State Univ., Corvallis. Dept. of Botany.
C. David McIntire, and Barry L. Wulff.
Limnology and Oceanography, Vol 14, No 5, p 667-678, 1969. 6 fig, 4 tab, 20 ref. NSF Grant GB-7203.

Descriptors: *Laboratory tests, *Laboratory equipment, *Benthic flora, *Light intensity, *Ecosystems, *Model studies, Diatoms, Vertical migration, Distribution patterns, Respiration, Intertidal areas, Acclimatization, Bottom sediments, Tidal effects, Oregon.
Identifiers: *Marine benthic diatoms, *Yaquina Bay (Oregon), *Model ecosystem, Desiccation, Vertical distribution, Substrate, Respirometer.

Effects of light intensity and of exposure to desiccation on the vertical distribution and growth of populations of marine benthic diatoms were investigated in a laboratory model ecosystem and in a respirometer chamber. The diatom flora that developed in the ecosystem was similar to that from field stations in lower Yaquina Bay, Oregon. The vertical distribution of many species was closely related to light intensity and period of exposure to desiccation. Biomass accumulated most rapidly on substrates subjected to high light intensities, without exposure to desiccation. Communities acclimated to different light intensities and periods of desiccation responded differently to changes in light intensity in the respirometer chamber. Results of these experiments indicate that the laboratory apparatus described can be useful in the study of simplified intertidal communities. (Sjolseth-Washington)

FIELD OBSERVATIONS ON THE USE OF SODIUM CYANIDE IN STREAM SURVEYS,
Tennessee Game and Fish Commission.
William R. Tatum.
Presented at the 22nd Annual Meeting of the Southern Division of the American Fisheries Society, Baltimore, Oct 21-23, 1968. Unpublished. 7 p manuscript only. 1 tab, 3 ref.

Descriptors: *Fish populations, *Toxicity, *Evaluation, *Census, Tennessee, Surveys, On-site investigations, Sodium compounds, Fish management, On-site data collections, Crustaceans, Water temperature, Benthos, Benthic fauna, Insects, Mollusks, Annelids, Trout, Rainbow trout.
Identifiers: *Sodium cyanide, *Stream surveys.

Sodium cyanide has been an effective method for sampling the stream fish populations in Eastern Tennessee. Its portability makes it a practical stream management tool. Cyanide is an excellent cold weather sampling method. Three ounces of cyanide in trout streams and six ounces in warmwater streams per cubic foot per second flow will sample 100 yards. In water colder than 55F, mortality of fish is not acute. Rainbow trout and various warmwater fish collected with cyanide and held in aquaria showed no deleterious effects from exposure to the chemical. Reduction in stream invertebrate populations after cyanide application is evident. (Sjolseth-Washington)

CHEMICAL COMPOSITION OF RAINBOW TROUT URINE FOLLOWING ACUTE HYPOXIC STRESS,
Bureau of Sport Fisheries and Wildlife, La Crosse, Wis. Fish Control Lab.
Joseph B. Hunn.
Transactions of the American Fisheries Society, Vol 98, No 1, p 20-22, 1969. 1 tab, 16 ref.

Descriptors: *Stress, *Oxygen requirements, *Urine, *Rainbow trout, *Fish physiology, Sodium, Potassium, Magnesium, Phosphates, Chlorine, Hydrogen ion concentration, Trout, Salmonids.
Identifiers: *Salmo gairdnerii.

Rainbow trout were anesthetized with MS-222, catheterized, and placed in urine collecting chambers. After acclimation and collection of control urine samples, water flow was discontinued for 30 min. Oxygen levels dropped from 4.9 to 2.8 mg/l. Following this stress, water flow was restored and accumulated urine samples were collected at 1, 4 and 20 hours post-stress. Normal urine pH is 7.0, but post-hypoxia it becomes acidic. Abnormally high levels of Na K, Mg, Cl and inorganic PO4 were present in the urine after hypoxic stress. (LeGore-Washington)

CONTROL OF OYSTER DRILLS, EUPLEURA CAUDATA AND UROSALPINX CINEREA, WITH THE CHEMICAL POLYSTREAM,
Bureau of Commercial Fisheries, Milford, Conn. Biological Lab.
Clyde L. MacKenzie, Jr.
Fishery Bulletin, Vol 68, No 2, p 285-297, 1970. 2 fig, 5 tab, 7 ref.

Descriptors: *Chemcontrol, *Pesticide toxicity, *Gastropods, Oysters, Chemicals, Aquiculture, Chlorinated hydrocarbon pesticides, Organic compounds, Predation, Snails.
Identifiers: *Oyster drills, *Polystream, *Polychlorinated benzenes, *Benzene, Control, Eupleura caudata, Urosalpinx cinerea, Chlorinated benzenes, Depuration.

Oyster drills are important predators on commercial oyster beds. Applications of Polystream (Hooker Chem. Corp., mixture of polychlorinated benzenes) killed up to 100% of the drills when currents were of low velocity. Spring treatment appears more effective than later treatment, although surviving drills cease feeding for several months, and populations remained reduced for at least two years. Small Polystream residues were noted in oyster tissues, but these were soon eliminated by depuration. Gastropods other than drills were also killed and many other invertebrates were affected by treatment, although entire populations were not eliminated. Several fish were killed, but the extent of the deleterious effect is unknown. (LeGore-Washington)

A POTENT CHEMOTHERAPEUTIC AGENT AGAINST FISH DISEASES: 6-HYDROXYMETHYL-2- (2- (5-NITRO-2-FURYL) VINYL) PYRIDINE (P-7138),
Dainippon Pharmaceutical Co., Osaka (Japan).
Masanao Shimizu, and Yoshiyuki Takase.

Bulletin of the Japanese Society of Scientific Fisheries, Vol 33, No 6, p 544-554, 1967. 2 fig, 15 tab, 9 ref.

Descriptors: *Pyridine pesticides, *Fish diseases, *Bactericides, *Fish farming, *Fungicides, *Aquiculture, *Inhibition, Fish management, Chemcontrol, Pathogenic bacteria, Eels, Analytical techniques, Inhibitors, Toxicity, Evaluation, Absorption, Growth rates, Fungi.
Identifiers: *Chemotherapeutic agents, *P-7138, *Aeromonas liquefaciens, Aeromonas salmonicida, Saprolegnia parasitica, Goldfish.

6-Hydroxymethyl-2 (2- (5-nitro-2-furyl) vinyl) pyridine (P-7138) exhibited inhibitory activity in vitro at low concentrations (1 mcg (sic)/ml or less) against most of 30 tested Gram negative and Gram positive bacteria, including several strains isolated from fish. It was also active in vitro against fungi and Trichomonas sp. P-7138 was effective against Aeromonas liquefaciens both when administered orally to fish and when fish were bathed in solution. Only doses on the order of 2000 mg/kg of fish weight were lethal to eels. (Sjolseth-Washington)

OXYGEN POISONING IN THE ANNELID TUBIFEX TUBIFEX. I. RESPONSE TO OXYGEN EXPOSURE,
Illinois Univ., Urbana. Dept. of Physiology.
Joann G. Walker.
The Biological Bulletin, Vol 138, No 2, p 235-244, 1970. 2 fig, 3 tab, 31 ref.

Descriptors: *Tubificids, *Water pollution effects, *Mortality, *Dissolved oxygen, Annelids, Respiration, Animal physiology, Analytical techniques, Laboratory tests, Acclimatization, Environmental effects, Toxicity, Animal behavior, Pressure, Aquatic animals, Aquatic environment, Gases, Worms, Oxygen, Pathology, Nitrogen.
Identifiers: *Tubifex tubifex, *Oxygen poisoning, *Pressure effects, *Hyperbaric oxygen, Adaptation.

Exposure to hyperbaric oxygen caused T. tubifex to become hyperactive. The behavioral response to oxygen pressure became complete only after several hours, when the animals either disintegrated or began to resume normal behavior. Exposure to four atmospheres absolute oxygen pressure for 13-15 hr caused high mortality of T. tubifex. Exposure to four atmospheres of absolute oxygen pressure for 9-12 hr killed approximately half of the treated animals, while exposure for 8 hr or less caused no greater mortality than in unexposed controls. The lethal effects of oxygen exposure developed only after several hours. Exposure to three atmosphere of nitrogen added to one atmosphere of air for as long as 30 hr resulted in no more deaths than in unexposed controls and caused no change in worm behavior. Interruption of a 16 hr oxygen exposure with return to atmospheric conditions enhanced survival of oxygen-treated T. tubifex. Increased duration of interruption led to increased survival of oxygen-treated worms. Adaptation to hyperbaric oxygen occurs in T. tubifex following several weeks of exposure to atmospheric oxygen tensions in shallow containers without a protective mud environment. (Sjolseth-Washington)
W71-06730

THE RELATION BETWEEN TEMPERATURE AND TOXICITY OF PCP FOR THE CARP FISH. STUDIES ON THE BIOLOGICAL ASSAY OF CHEMICALS TO FISH. VI (IN JAPANESE),
Ihara Agricultural Chemicals Inst., Shimizu (Japan).
Shoji Asano, Sumio, Nagasawa and Shizue Fushimi.
Botyu-Kagaku, Vol 34, No 1, p 13-21, 1969. 7 fig, 6 tab, 17 ref. English summary.

Descriptors: *Phenols, *Carp, *Bioassay, *Toxicity, *Water temperatures, Fish physiology, Thermal stress, Water pollution effects, Lethal limit, Regression analysis, Mathematical studies, Isotherms, Fishkill, Statistical methods, Statistical models, Chemical wastes.
Identifiers: *PCP, *Water temperature effects.

Relationships between the lethal action of PCP-Na (sodium pentachlorophenate) salt to carp and temperature are discussed from statistical and physiological points of view. A complete time-mortality curve is presented. The median lethal times in a PCP concentration of 0.8 ppm were determined at 23, 26, 29, 32 and 35 deg C. A linear relationship between the median lethal time and temperature was obtained, and a positive temperature coefficient for PCP lethality was found. PCP's lethality increases approximately two-fold with each 10 deg C rise in temperature. The standard deviation of the carp's susceptibility, however, increases with increasing temperature. The median lethal times at PCP concentrations of 0.5 to 16.0 ppm were also determined at 20, 23, 26, 29 and 32 deg C. The relationship between lethal time, PCP concentration and temperature could be determined with a multiple regression equation. By transforming concentration into temperature, with a factor for equalizing individual differences in lethal concentration, the relationship between temperature and lethal time was derived. A linearity similar to that described above was obtained between these two variables. (LeGore-Washington)
W71-06731

THE LEVEL OF N-AMMONIA AND N-UREA IN THE BLOOD SERUM AND BRAIN OF HEALTHY AND AMMONIA-INTOXICATED CARPS (CYPRINUS CARPIO L) (IN CZECH),
Vyzkumny Ustav Rybarsky a Hydrobiologicky Vodnany, Prague (Czechoslovakia).
Z. Svobodova.
Bulletin VUR Vodnany, Vol 6, No 1, p 11-19, 1970. 2 fig, 9 tab, 21 ref. English summary.

Descriptors: *Ammonia, *Carp, *Nitrogen compounds, *Fish physiology, Water temperature, Toxicity, Toxins, *Ureas.
Identifiers: *Cyprinus carpio, Blood serum, Detoxification, Brain.

The physiological values were determined of N-ammonia and N-urea in the blood serum of carp in two periods (Sept. - Oct. and Nov. - Dec.). Higher values were obtained in September and October, and may be explained by a more rapid metabolism of nitrogenous substances, connected with a higher water temperature. An acute intoxication of carp results in an increase in blood serum N-ammonia levels (five times); a chronic intoxication causes an approximate five-fold increase as compared with physiological values in each case. The methods of ammonia detoxification of carp is discussed. The level of N-ammonia in the brain of the fish after an experimental acute intoxication with ammonia is more than three times that of healthy fish. The use of these results for diagnostic purposes will be subject to further study. Changes in the levels of N-ammonia in the blood serum and brain of carp during acute intoxication with ammonia were examined. The most pronounced rise of the level of N-ammonia occurs during the first five minutes. The level increases only slowly thereafter. (LeGore-Washington)
W71-06732

ABSORPTION OF ENDRIN BY THE BLUEGILL SUNFISH, LEPOMIS MACROCHIRUS,
Louisiana State Univ., Baton Rouge. Industrial Research Lab.
Harry J. Bennett, and John W. Day, Jr.
Pesticides Monitoring Journal, Vol 3, No 4, p 201-203, 1970. 1 fig, 16 ref. NIH Grant ES-00276-01.

Descriptors: *Pesticides toxicity, *Organophosphorous pesticides, *Endrin, *Sunfishes, *Toxicity, Pesticides, Lethal limit, Absorption, Toxins, Agricultural chemicals, Fish, Fish physiology, Fish toxins.
Identifiers: *Bluegill, *Lepomis macrochirus, TLm, Gastrointestinal tract, Liver, Muscle.

Endrin absorbed by bluegill sunfish in lethal and sublethal concentrations was determined by electron capture gas chromatography. The amount of absorption was measured for the entire body, skeletal muscle, liver and gastrointestinal tract over 24 hr. At the lethal level (2.0 ppb), all the tissues absorbed increasing amounts of endrin throughout the tests. At the sublethal level (0.2 ppb), the entire body, skeletal muscle and liver exhibited an N-shaped absorption curve, with an initial sharp rise in endrin levels, followed by a drop, with a subsequent rise. This implies development of a temporarily effective mechanism for coping with the endrin. At the 0.2 ppb level, the gastrointestinal tract absorbed increasing amounts of endrin throughout the tests. (LeGore-Washington)

A KINETIC MODEL OF FISH TOXICITY THRESHOLD,
California Univ., Berkeley. Dept. of Civil Engineering.
Carl W. Chen, and Robert E. Selleck.
Journal of the Water Pollution Control Federation, p 294-308, August, 1969, part 2. 9 fig, 6 tab, 14 ref.

Descriptors: *Mathematical models, *Model studies, *Bioassay, Toxicity, Fishkill, Potassium compounds, Water pollution effects, Laboratory tests.
Identifiers: *Kinetic model, *Toxicity threshold, *Threshold concentrations, *Mixtures, *Dilution ratio, Zinc, Cyanide, Antagonism, Synergism.

A procedure is presented which may be used to determine the threshold concentrations of various mixtures of toxicants as well as to evaluate the proportional amounts of toxicity furnished by the individual toxic components, taking into account possible synergistic or antagonistic effects. For experimental verification of the model, zinc and cyanide were selected as toxicants. The survival function describing the fish bioassay data was found to be exponential after an initial induction period. The exponential rate coefficient is a function of at least four other coefficients when the toxicant concentration is maintained constant. The threshold concentrations of zinc and cyanide under the specified experimental conditions are 0.33 and 0.236 mg/l, respectively. (Sjolseth-Washington)
W71-06734

RELATIONS BETWEEN THE STRUCTURE OF CHLORAMPHENICOL AND ITS VEGETALIZING EFFECTS ON SEA URCHIN, PARACENTROTUS LIVIDUS, EGGS (IN FRENCH),
Station Zoologique, Villefranche-sur-Mer (France).
R. Lallier.
Acta Embryologiae et Morphologiae Experimentalis, Vol 10, p 280-287, 1968. 1 fig, 25 ref. English abstract.

Descriptors: *Physiological ecology, *Biochemistry, Inhibition, Chemical reactions, Embryonic growth stage, Mode of action, Chemicals, Proteins, Synthesis, Aquatic animals, Aquatic environment, Pollutants, Bioassay, Nitrogen compounds, Eggs, Invertebrates.
Identifiers: *Chloramphenicol, *Sea urchin eggs, *D-threo-chloramphenicol, *Chemical structure, *Nitrobenzene, *Alanine, Benzene, Developmental inhibition, Sterioisomers, Protein synthesis.

The effects of various analogues of chloramphenicol on the differentiation of sea urchin eggs were studied and compared to the vegetalizing effects of D-threo-chloramphenicol. Its sterioisomer, L-threo-chloramphenicol, inhibited development, but no vegetalizing effect was observed. The substitution of the nitro group in the D-isomer by an aminosulphonyl (sic) group (D-AMP-3) or by a methylsulphonyl group (D-thiophenicol) suppressed the vegetalizing action, and also inhibited development. With the substitu-

tion by a thiomethyl group (D-Win 5094), the vegetalizing activity was greatly reduced. Various nitrobenzene derivatives (p-nitrophenol, p-nitrobenzoic acid, p-nitrophenylhydrazine) inhibited development. L-beta- (nitrophenyl)-alpha-alanine reversibly stopped development at the blastula stage. Nitrobenzene and nitroaniline exerted some weak vegetalizing effect, indicated by a low percentage of gastrulas strongly pigmented with small evaginated entodermic vesicles. The nitro group appears to be important for the vegetalizing activity of chloramphenicol. The differential action of D-chloramphenicol on protein synthesis is suggested to explain its vegetalizing effects. (LeGore-Washington)

EFFICACY OF DI-N-BUTYL TIN OXIDE ON AN INTESTINAL FLUKE, CREPIDOSTOMUM FARIONIS, IN GOLDEN TROUT,
Wyoming Game and Fish Research Lab., Laramie.
Douglas L. Mitchum, and Tom D. Moore.
The Progressive Fish Culturist, Vol 31, No 3, p 143-148, July 1969. 2 tab, 3 ref. Dingell-Johnson Project, FW-3-R, Wyoming.

Descriptors: *ChemControl, *Parasitism, *Evaluation, *Fish parasites, *Fish kill, Fish management, Fish hatcheries, Fish diseases, Infection, Bioassay, Toxicity, Laboratory tests, Residues, Animal pathology, Public health, Rainbow trout, Mortality, Trout, Rainbow trout, Antihelminthes (Pesticides).
Identifiers: *Crepidostomum farionis, *Di-n-butyl tin oxide, Golden trout, Intestinal flukes, Flukes.

An experiment was conducted to determine whether di-n-butyl tin oxide has anthelmintic properties against Crepidostomum farionis in golden trout. Toxicity experiments were conducted on both rainbow and golden trout. Doses fed to the fish over a three day period were 150, 250 and 350 mg/kg of body weight. Fish were killed periodically after the three day treatment period and examined for flukes. Doses of 150, 250 and 350 mg/kg were 100% effective in eliminating the flukes. Intestinal, digestive tract, internal organs and muscle tissues were assayed for tin. Tin residues were found only in the digestive tract, primarily in the intestine. The data indicate that the tin compound is not readily absorbed by tissues outside the digestive tract and that the compound is rapidly eliminated by trout. (Sjolseth - Washington)

CHANGES IN FISH POPULATIONS AND MIGRATION IN RELATION TO INCREASED SEWAGE POLLUTION IN LITTLE PATUXENT RIVER, MARYLAND,
Maryland Univ., Solomons. Natural Resources Inst.
Chu-Fa Tsai.
Chesapeake Science, Vol 11, No 1, p 34-41, 1970. 3 fig, 3 tab, 13 ref.

Descriptors: *Water pollution effects, *Fish populations, *Fish migration, *Sewage effluents, Fishkill, Fish barriers, Catfishes, White perch, Suckers, Bottom sediments, Dissolved solids, Chlorination, Biological communities, On-site data collections, On-site investigations, Water analysis, Biochemical oxygen demand, Water temperature, Dissolved oxygen, Community development, Maryland, Sunfishes.
Identifiers: *Little Patuxent River (Maryland), *Yearly variations, *Species changes, *Population changes, Smallmouth bass, Black crappie.

Increased sewage pollution in the Little Patuxent River, Maryland from 1958 to 1967 brought about changes in fish migration, abundance of resident species, and the fish community of the stream. The up-stream migration of white catfish, white perch, white sucker, and northern redhorse was apparently adversely affected by the increased sewage pollution. The downstream ranges and abundance of resident smallmouth bass and northern hog sucker decreased as did the upstream ranges and abundance of black crappie. Brown bullhead, golden shiner, redbreast sunfish, and bluegill showed different degrees of changes in abundance without reduction in their distribution ranges. Number of species and fish abundance decreased drastically in the area immediately below the chlorinated sewage outfalls. Downstream, in the organically enriched areas, the fish community composition changed although there were no changes in number of species. (Sjolseth - Washington)

EFFECTS OF THE HERBICIDE SILVEX ON BENTHOS OF A FARM POND,
Missouri Univ., Columbia. Dept. of Zoology.
George L. Harp, and Robert S. Campbell.
The Journal of Wildlife Management, Vol 28, No 2, p 308-317, 1964. 1 fig, 3 tab, 21 ref.

Descriptors: *Benthic fauna, *Animal populations, *Aquatic productivity, *Comparative productivity, *Herbicides, Chrysophyta, Farm ponds, On-site investigations, Water pollution effects, Aquatic plants, Pond weeds, Chemcontrol, Gastropods, Oligochaetes, Aquatic insects, Invertebrates.
Identifiers: *Silvex, *Chaoborus, Typha angustifolia, Potamogeton americanus, Jussiaea, Sagittaria, Leeches.

The bottom fauna of plastic enclosures within a farm pond was investigated before and after treatment with the potassium salt of 2- (2,4,5-trichlorophenoxy) proprionic acid (silvex). Petersen dredge collections were made at 28 day intervals, June, 1961 through August, 1962. Six polyethylene enclosures, 12 x 18 ft, were treated with silvex: three at 2.8 ppm and three at 4.6 ppm. One enclosure and the open pond served as controls. The standing crop of benthos doubled numerically and gravimetrically in enclosures treated with heavy concentrations. The increase in numbers of tendipedids and oligochaetes in the treated areas was correlated with increased organic detritus afforded by decomposing rooted aquatic plants. Chaoborus increased greatly in treated enclosures. Libellulids increased one year after treatment. Snails, leeches and coenagrionids appeared to be unaffected by treatment with silvex in the concentrations used. Chrysops decreased quickly in treated areas and reappeared only during the last two months of the study, and only in enclosures treated with the lighter concentrations. The composition of the benthic community of a farm pond and the control of rooted aquatic plants by silvex are described. (Sjolseth - Washington)

THE COMPATIBLE EXISTENCE OF NON TARGET SPECIES TO PESTICIDES,
Mississippi State Univ., State College. Dept. of Zoology.
Denzel E. Ferguson.
Bulletin of the Entomological Society of America, Vol 15, No 4, p 363-366, Dec, 1969. 35 ref.

Descriptors: *Resistance, *Pesticide toxicity, Water pollution effects, Biological properties, Compatibility, Animal behavior, Animal physiology.
Identifiers: *Ecological adaptations, *Behavior adaptations, *Physiological adaptations, Adaptations, Protective mechanisms, Avoidance, Susceptibility.

Three types of adaptation are discussed by which non-target animals may be adapted for survival in a pesticide-contaminated environment. (1) Ecological adaptations such as habitat selection may determine the extent to which an animal is exposed to pesticides. The niche in the food web may govern the amount of pesticide residue accumulated by a species. (2) Behavioral adaptations such as migration and food preference affect pesticide intake. (3) Physiological adaptations such as natural resistance, penetrative power of insecticides and genetic resistance are known to protect some organisms from toxic effects. Although non-target animals often exhibit numerous mechanisms tha protect them against pesticides, most of thes mechanisms are of limited value in highly con taminated environments. Also, almost all of thes mechanisms involve a dilemma in that one specie is benefitted at the expense of another. The need t develop more specific control measures and les persistant chemicals is stressed. (Sjolseth Washington)

INFLUENCE OF PESTICIDE RUN-OFF I MONTEREY BAY,
Naval Postgraduate School, Monterey, Calif. Dep of Oceanography.
E. C. Haderlie.
Marine Pollution Bulletin, Vol 1 (NS), No 3, p 42 43, March 1970.

Descriptors: *DDT, *Pesticide drift, *Pesticid residues, *Water pollution, *Pesticide toxicity *Surface runoff, *On-site investigations, Pesticid kinetics, Water pollution effects, Aquatic bird Gas chromatography, Gulls, Crabs, Bottom sed ments, Benthic fauna, Estuarine environment, Se lions, Salinas River, Tissue analysis, California Heavy metals.
Identifiers: *DDT, *Monterey Bay (California Bird kill, Cormorants, Grebes, Petrels.

Evidence exists suggesting that runoff from DD treated farmlands in the Salinas River Valley California has resulted in pesticide (DDE) con tamination of the benthic community and the bo tom sediments of Monterey Bay. The Salinas Rive is the only major tributary entering the bay. A bir kill occurred in Monterey Bay in 1969 after exte sive surface runoff from the Salinas Valley. Th dead seabirds contained DDE levels as high higher than anywhere in the area: 805 ppm DDE the liver of a gull, 412 ppm DDE in the liver of petrel, and 192-292 ppm DDE in livers of weste grebes. A survey being conducted on the benth community and on the bottom sediments of Mo terey Bay is described. It is hoped that this will yie a better understanding of the benthic community Monterey Bay and of the role played in ecologic cycles by heavy metals and by pesticides. (Katz Washington)

EFFECT OF WATER QUALITY IN BE LINGHAM BAY ON JUVENILE SALMON,
Washington Univ., Seattle. Coll. of Fisheries.
D. E. Sjolseth, E. O. Salo, and M. Katz.
Preprint, Fifth International Water Pollutio Research Conference, San Francisco, 1970. Pap I-26, 27 p, 3 fig, 10 tab, 28 ref.

Descriptors: *Water pollution effects, *Pu wastes, *Distribution, *Dissolved oxygen, *Fis populations, *Streamflow, On-site data collection On-site investigations, Chinook salmon, Wat quality, Washington, Fish behavior, Distributio patterns, Tidal effects, Fish management, Fis migration, Marking techniques, Salinity, Wat temperature, Turbidity, Mortality, Regression ana ysis.
Identifiers: *Spent sulfite liquor, *Fish catch, Co salmon, Bellingham Bay Washington, Nooksac River Washington, Townetting.

A two-phase investigation into some ecological fa tors in the estuarine and freshwater nursery are that may affect salmon and may influence t behavior of juvenile salmon was conducted on t Bellingham Bay-Nooksack River system Washington State. No significant correlation w found between dissolved oxygen and spent sulfi liquor. No D.O. levels below 6.6 mg/l and S.S.L.'s above 483 ppm were found. S.S.L. a D.O. were found to have no significant correlatio with the catch of salmon. Two salmon streams we studied during the summer to determine coho sa mon mortality. In both streams there was over 50 mortality during a six-week period in late summe It is the freshwater and not the estuarine habit

which is limiting salmon production. (Sjolseth - Washington)

5D. Waste Treatment Processes

SEPARATE AND COMBINED SEWERS.

Water Wastes Eng, Vol 5, No 12, p 22, Dec 1968.

Descriptors: *Sewerage, Structural design, Systems analysis, Separation techniques.
Identifiers: *Combined sewers, Sewer hydraulics.

This round table discussion describes the general picture of the storm and sanitary sewerage systems, including the ranges and sizes of each of the types of sewers, of the cities the participants represent. Each participant also relates his city's problems in regard to the effect of combined sewers on treatment plants and under conditions of storm flow. Three of the cities have implemented separate sewers, while three others have not undergone separation because of its high cost. Our city has proposed a less costly plan of eliminating ground water seepage into sewers, and the last city (the only one located in Canada) has not yet estimated the cost of separation.

REPORT ON PRESSURE SEWERAGE SYSTEM, SUMMER STREET SEPARATION STUDY AREA, BOSTON, MASSACHUSETTS.
American Society of Civil Engineers, New York; and Camp, Dresser and McKee, Boston, Mass.

Combined Sewer Separation Project, Report, Sept, 1968, FWPCA Program No 11020 EKO.

Descriptors: *Cost analysis, *Design, Pressure conduits.
Identifiers: *Building plumbing separation, *Sewer separation, Boston, Massachusetts, Gravity sewer, Sewage flow variations.

The report studies the design, estimated costs, and evaluates the feasibility of the hypothetical application of the ASCE Project Scheme of pressure sewers for separation in representative combined sewer areas from layouts by the Project staff. The Boston study researched the 53-acre gently sloping, heterogeneous commercial Summer Street Separation Study Area. The report describes the separation of building plumbing in detail in a typical three-quarter century old five story and basement commercial building 65-ft. by 145-ft. in plan, and estimates the cost of plumbing separation. Four alternative pressure sewer collection systems are indicated with plans and hydraulic profiles. Some systems included in-line main pumping stations. The least expensive complete pressure system, which did not include a main pumping station, is estimated to cost $4,700,000. Both costs include costs of building plumbing separation, $4,000,000 for the pressure system including communitors, wet walls and non-clog pumps, and 2,000,000 for the gravity systems.
W71-06525

SEPARATION OF COMBINED WASTE WATER AND STORM DRAINAGE SYSTEMS, SAN FRANCISCO STUDY AREA.
Brown and Caldwell, San Francisco, Calif.

ASCE Combined Sewer Separation Project Report, FWPCA Program No 11020 EKO.

Descriptors: *Cost analysis, *Design, Pressure conduits.
Identifiers: *Building plumbing separation, *Sewer separation, Gravity sewer, Plumbing code, San Francisco (Calif), Storage-grinder pump.

The report studies the design, estimated costs, and evaluates the feasibility of the hypothetical application of the ASCE Project Scheme of pressure sewers for separation in representative combined sewer areas from layouts by the Project staff. The San Francisco study researched the 323 acre predominantly residential, steeply sloping, Launa Street Sewer Service District. The report describes methods of building plumbing separation and indicates two alternative arrangements of pressure sewers, with plans and profiles. Estimates of construction cost of each are compared with that of a conventional gravity system of separation designed earlier by the City. Plumbing separation, is estimated to cost about $5,400,000 for the gravity method and about $4,400,000 for the pressure method not including storage-grinder-pump units.

COMBINED SYSTEM--SEPARATE SYSTEM,
W. V. D. Emde.
Oesterr Wasserwirtsch (OSWAAI), Vol 19, No 7/8, p 125-130, 1967.

Descriptors: *Investigations, *Sewers, *Sewerage, Hydrograph analysis, Design.
Identifiers: *Combined sewers, *Separate system.

In a paper presented at a seminar on canalization held at Raach, Austria, in 1967, the author gave details of investigations into the efficiency of sewerage systems, and outlined the advantages and disadvantages of separate systems as compared with combined systems. Describing the design and construction of each system he emphasized that neither could be regarded as the more efficient, and stressed the need for graphical and hydrographical surveys when sewerage systems are planned and that the final decision must depend on the purposes which the sewerage system is to serve. For small communities, housing estates, and small hotels the combined system can be of advantage, provided the discharge of rainfall and runoff is controlled and the quality of the receiving waters is not affected. Where future plans require extensions of sewerage systems, the separate system is more suitable, as long as operational control and plant maintenance are carried out regularly.

STORM-WATER TANKS IN COMBINED SEWERAGE SYSTEMS,
D. Londong.
Ber Abwassertech Ver (BABVAD), Vol 19, p 195-210, 1968.

Descriptors: *Design, *Application methods, *Flow control.
Identifiers: *Storm tank, Combined sewers.

The author discusses the important role of stormwater tanks used to prevent and retard the discharge of sudden and heavy rainfalls from combined sewerage system to receiving waters, and he gives details of design calculations for these tanks and their application.
W71-06530

STORM-WATER TANKS IN COMBINED SEWERAGE SYSTEMS,
D. Londong.
Staedtehyg (STDHAT), Vol 17, No 9, p 199-206, 1966.

Descriptors: *Flow control, *Analysis, *Pollution abatement, *Rainfall disposition, Flow rates.
Identifiers: *Storm tank, Germany.

Rainwater, discharged from combined or separate systems, can have severe polluting effects on receiving waters especially in industrial areas. Discussing the methods used for reducing such pollution, the author refers to German specifications for three standard types of stormwater retarding tanks, designed to prevent the direct discharge of the first flush of rainfall and to restrict the flow from being carried forward to receiving waters or sewage works. Various methods of calculations for stormwater retarding tanks in sewerage systems are reviewed and compared as to their accuracy. Illustrated details are given of a revised method in which different rates of flow at varying durations of rainfall can be calculated using different parameters.

MALLING RDC REGIONAL DRAINAGE SCHEME,
D. Lowe.
Surveyor, Vol 82, No 3971, p 29-33, Jul 12, 1968. 5 fig, 1 tab.

Descriptors: *Sewage treatment, *Sewers, *Treatment facilities, *Sewage disposal, *Design, *Construction.
Identifiers: *Combined sewers, *Great Britain, Trunk sewer.

Owing to restrictions on the choice of available sites, unusual design and construction techniques were required to build a sewage treatment works which forms part of the 3 million pounds-sterling Snodland-Ightham regional drainage scheme in a rural district of Kent. The Snodland area was mostly sewered on a partially combined system to a totally inadequate sewage disposal works, and the Ditton area's disposal works was heavily overloaded. The basis of the new sewerage system is a trunk sewer laid from a new sewage disposal works. Into this main trunk system flow from area villages will be brought by either pumping or gravity. Solutions to each town's problems will be implemented through the use of intercepting sewers, pumping stations, pumping mains, etc. Aspects concerning site selection for the new sewage works are

discussed, and then the design of the works is detailed. Construction problems and solutions to these problems are explained in regard to both the regional sewerage scheme and the sewage disposal works.

WASTE WATER SYSTEM FOR THE METROPOLITAN CORPORATION OF GREATER WINNIPEG,
A. Penman.
J Water Pollution Control Fed, Vol 39, No 3, p 373-383, Mar 1967.

Descriptors: *River regulation, *Sewerage, Future planning (Projected), Recreation, Urbanization.
Identifiers: *Separate system, *Investigations.

The Metropolitan Corporation recognized its duties in restoring the rivers to the requirements of the urban area so that the citizens could use these rivers for recreational purposes. This necessitated the expansion of the existing facilities and the addition of new facilities. Sewer rentals and industrial wastes were two major areas investigated. A separate sewer system was looked into by both city and consulting engineers. It was decided that the $200 million plus cost of intercepting the old combined system was not feasible; however, future development of areas along the Red and Assiniboine Rivers will be based on separate sewer systems.

OPERATION OF SEWERAGE WORKS FOR BUDAPEST,
M. Szilagyi.
Paper presented at a conference on the Construction of Complex Supply Installations at Budapest, 1968, Theme No 4.4.

Descriptors: *Sewerage, *Sewers, *Surveys.
Identifiers: *Hungary.

The built-up area of Budapest covers 23,700 ha, of which 9400 ha are connected to the sewerage system. In 1966 the length of the sewer network has about 2000 km. There were 32 sewage works and pumping stations, and the quantity of sewage and rainwater discharge amounted to over 300 million m cu. The annual volume of sludge removed from the sewer amounted to 60,000 m cu.
W71-06536

COMBINED SEWERS MAY BE AN ADVANTAGE,
Frank I. Vilen.
Am City, Vol 85, No 1, p 68-70, Jan 1970.

Descriptors: *Sewers, *Design, Storm runoff, Biological treatment, Separation techniques.
Identifiers: *Kenosha, Wisconsin, *Combined sewers, Sludge treatment plants.

An alternative to separation, which utilizes combined sewers in conjunction with activated sludge treatment plants, is being put into operation in Kenosha, Wisconsin through a FWPCA grant. The plant employs the biological-adsorption process and can treat up to 20 mgd of combined sewage. Details of how the system works are included as well as a flow sheet diagram of the plant. The plant will save the city at least $6 million over sewer separation and during dry weather portions of the system can supplement normal plant operations. The plant will treat flow from only 70-80% of the storms, but because of the 'first flush' action of storm runoff, the greatest bulk of BOD and suspended solids will be captured. Parameters to be measured and evaluated to determine the efficiency of the system are listed.
W71-06537

COMBINED SEWERS IN CANADA,
D. H. Waller.
Eng J, Vol 52, No 6, p 22-30, Jun 1969, Paper presented at the Annual General Meeting of the Engineering Institute of Canada, May 29-31, 1968.

Descriptors: *Sewers, *Surveys, Overflow, Separation techniques.
Identifiers: *Combined sewers, *Canada.

The author presents a survey of combined sewers in Canada similar to the one he undertook in 1967 on the same subject in the United States. Even when combined sewers are large enough to carry peak storm flows in addition to domestic sewage, they do not provide the higher velocities in dry weather that are needed to prevent solid deposition. Thus, up to 1/3 the annual production of solids and BOD may be overflowed during storms and held back from treatment. Problems such as these necessitated this study which provides information in four main areas: (1) the extent and distribution of Canada's combined sewers; (2) the prevailing attitudes and policies in regard to combined sewers; (3) factors influencing these attitudes and policies; and (4) descriptions of methods proposed and adopted to diminish overflows from combined sewers. A majority of the population surveyed considered combined sewer overflows to be a nuisance. Separation is too expensive to warrant institution in most communities. Some combined systems have not yet developed to the point where they include overflow, and in some areas the pollution from this source is not considered to be a problem. More information is needed regarding less-costly alternatives to separation. Separation should be implemented without delay for flood relief, when combined sewers are replaced and in new construction, or in plumbing for new buildings. These programs are not overly expensive, and they leave open the option of instituting alternatives which future technology may uncover.

AVONMOUTH INDUSTRIAL ESTATE--UNUSUAL DRAINAGE SCHEME,
K. J. West.
J Inst Munic Engrs, Vol 95, No 12, p 363-367, Dec 1968.

Descriptors: *Drainage systems, *City planning, Urbanization, Sewerage, Separation techniques.
Identifiers: *Great Britain, *Combined sewers.

Systems of drainage considered for the City of Bristol, England include: a separate system with stormwater draining to rhines; a separate system with stormwater draining through pipes to existing outfall culverts; and, combined systems. The combined sewerage system was adopted for a major part of the estate.
W71-06539

STOKE SEWER RENEWED AFTER CRUDE SEWAGE OVERFLOW.
Surveyor, Vol 85, No 4049, p 38-39, Jan 16, 1970. 1 fig.

Descriptors: *Sewerage, *Sewers, *Treatment facilities, *Control structures, Control systems, Contracts, Construction.
Identifiers: *Great Britain.

A sewerage reconstruction program in the Burslem area of Stoke-on-Trent involves a four-stage renewal of the sewer system and reconstruction of the water pollution control works. Old sewers were in poor structural and hydraulic condition, and several sections of the main outfall sewer upstream of the treatment works collapsed causing crude sewage to overflow and form a large lake of sewage. Two contracts provided a sanitary sewer from the works plus a surface water culvert connecting with a feeder to the River Trent. A third contract provided a separate storm and sanitary system connecting the old sewer network with the sewer and culvert constructed previously. Other structures built under the contract are described.

OUTLINE DESCRIPTION OF ASCE PROJECT ON 'SEPARATION OF SANITARY SEWAGE FROM COMBINED SYSTEMS OF SEWERAGE'.
American Society of Civil Engineers, New York.

ASCE Combined Sewer Separation Project Technical Memorandum No 1, Feb 21, 1966. FWPCA Program No 11020 EKO.

Descriptors: *Pressure conduits, Separation techniques.
Identifiers: *Combined sewers, *Sanitary sewage, Comminuted sewage.

Descriptions of the project separation scheme, project goal and project background are given. The general concept of the ASCE Project scheme is to pump cumminuted sanitary sewage from individual buildings and building complexes through relatively small pressure tubing laid in existing building connections and thence into new pressure conduit suspended in existing street sewers. Potential advantages of the scheme are discussed. The project wishes to develop feasible designs and operation and to test them in actual systems. The immediate objective is to examine and evaluate both the feasibility and probable cost. The background of the project is reviewed. An appendix summarizes the need for separation of combined sewerage systems and the national scope of the problem.

MASSIVE SEWER INFILTRATION,
Thomas E. Llewellyn.
Am City, Vol 83, No 10, p 90-91, Oct 1968.

Descriptors: *Maintenance, *Repairing, Infiltration.

The North Tahoe Public Utility District instituted a massive sewer repair program after it discovered that sewage flows were highly excessive. Snow Creek and Lake Tahoe were becoming polluted. 200 manholes were leaking and permitting entrance of surface and groundwater, and many lateral sewers were causing infiltration. Smoke bombs employed to pinpoint offenders disclosed storm inlets connected to sanitary sewers. Methods used to correct violations and sewer defects are described.

LEAST COST SAND FILTER DESIGN FOR IRON REMOVAL,
Iowa State Univ., Ames. Dept. of Civil Engineering; and Iowa State Univ., Ames. Engineering Research Inst.
Jerry Y. C. Huang, and E. Robert Baumann.
Journal of the Sanitary Engineering Division, ASCE, Vol 97, No SA 2, p 171-190, April 1971. 20 p, 5 fig, 9 tab, 7 ref, 1 append.

Descriptors: *Optimization, *Mathematical models, *Design, *Computer programs, Operating costs, Flow rates, Head loss, Sewage treatment.
Identifiers: *Least cost analysis, *Sand filtration, Iron removal.

An empirical filter performance prediction model was used in developing a computer program for predicting sets of equivalent sand filter designs and their first and operating costs. It was confined to a consideration of studies of the optimization of influent control, single-media sand filters to remove iron from suspension in water. The effects on the cost of the filter system of pertinent variables such as sand size, sand depth, terminal head available, flow rate, and run length were evaluated. Of the variables affecting filtration performance, the two held constant were: (1) kind of influent suspended solids; and (2) method of filter operation. The performance prediction model assumed that the flow rate remained constant during a filter run. For all sand sizes studied (0.6 mm to 1.3 mm), the optimum design filtration rate (4.0 gpm per sq. ft. - 5.5 gpm per sq. ft.), run length (32 hr. - 42 hr.), and terminal head loss (8 ft. - 11 ft.) all closely approximated values used in current practice. The optimization techniques developed to predict both the filter designs providing equivalent performance and their costs have potential application in design of new filtration plants and prediction of operating conditions, such as run length and effluent quality, of existing sand filtration plants. (Kriss-Cornell)

THE TIDAL THAMES 1967.
Effluent Water Treat J, Vol 8, No 9, p 463-465, Sep 1968.

Descriptors: *Pollution abatement, *Design, Sewerage, Estuaries, Storm runoff.
Identifiers: Thames River, Storm sewage, Great Britain.

The article concerns aspects of pollution control along the tidal river. The greatest effect of the discharge from the Greater London Council sewage works on the tidal Thames originated from the outfall works at Beckton. A scheme for reduction in storm sewage discharges from the sewerage system leading to the Beckton works was being examined. New trunk sewers, a pumping plant, and storm sewage tanks would be most likely involved in the scheme. The cost of the Beckton improvements was estimated at 21 million pounds, and of the improvements of the sewerage and storm sewage disposal systems at 22 million pounds.
W71-06629

WHAT TO DO WITH SEWAGE WHEN IT RAINS HARD.

Eng News-Record, Vol 178, No 16, p 30-31, Apr 20, 1967.

Descriptors: *Tunnel construction, *Tunnels, Storm runoff, Water treatment, Control systems.
Identifiers: *Chicago.

Chicago is building a $14.4-million deep tunnel system to carry spillages from combined storm and sanitary sewers during rainfall. The FWPCA has indicated four main areas related to stormwater runoff problems which require further study and demonstration: drainage area control; collection system control; external discharge control, including treatment of both combined sewer overflow and stormwater run-off; and a miscellaneous area, consisting of the economic feasibility of substituting separate sewers for combined sewers and local for central treatment facilities, better hydrologic analyses, new management procedures, construction materials and methods, and the development of performance criteria for standards of water quality.
W71-06631

WATER MONEY NEEDS REQUIRE MORE THAN PROMISES.

Environ Sci Technol, Vol 4, No 4, p 278, Apr 1970.

Descriptors: *Pollution abatement, Water treatment.
Identifiers: Waste treatment costs, Sewered population statistics.

S. 3472, the program for water pollution cleanup, calls for $10 billion for construction of municipal waste treatment plants. Among spokesmen at the 4th Annual Legislative Seminar concerned with the continuing cleanup is James R. Ellis who states that cities are in a catch-up situation. According to Ellis, 35% of the sewered population in the United States received 5% of the federal dollar during the period 1965 - 1969. Some of Ellis' suggestions are cited. John L. Salisbury, a Maine spokesman, contends that the need for secondary treatment is being challenged.

Descriptors: *Storm runoff, *Sewage treatment, *Water pollution, *Foreign research.
Identifiers: *Thailand.

The Thailand government's decision to plan for drainage and sewerage in Bangkok has led to increased research at the Asian Institute of Technology in Bangkok. Studies relating to stormwater collection, river pollution, and sewage treatment have been made in cooperation with interested authorities; and the results are applicable not only to Bangkok's project but also to other tropical regions. Topics of pertinent research projects include: (1) the anaerobic treatment of tapioca starch waste; (2) characteristics of treatment of Bangkok septic-tank sludge; (3) a Bangkok runoff hydrograph; (4) the ecology of polluted canals in Bangkok; (5) a study of photosynthetic oxygen production in the Chao Phya River; (6) pollution of the Chao Phya River, Bangkok; and (7) oxygen balance in the Chao Phya River estuary. Research is also proceeding on industrial waste treatment in Southeast Asia including studies on design criteria for waste stabilization ponds and sludge drying beds, and the progress of biological assimilation of wastes in a tripical climate. Water treatment is another area currently being investigated.

REPORT OF COMMISSION TO INQUIRE INTO ALLEGED NUISANCES IN AUCKLAND METROPOLITAN DRAINAGE DISTRICT.

New Zealand House of Representatives, 1965. 32 p.

Descriptors: *Sewage treatment, Evaluation, Remedies.
Identifiers: *New Zealand.

This report, on the investigation of nuisances caused by midges and offensive odors at the Mangere sewage works of the Manukau Sewerage Scheme, Auckland, deals with the causes of these nuisances, possible methods of elimination, and the necessity for legislation. Since much of the nuisance is attributable to the sewage reaching the works in a stale condition, it is recommended that the Orakei combined sewerage system be cleaned at least once a year, regular sampling be carried out during periods of low flow, provision be made for the injection of compressed air at each pumping plant to minimize septic conditions in the pressure mains, and the inverted siphons be flushed at least once a week during the dry season. Certain modifications are also recommended at the sewage works, including the covering of preliminary aeration and primary sedimentation tanks, the use of percolating filters to regulate the load on the oxidation ponds, and the reduction of recirculation of effluent to increase the period of sedimentation and the amount of sludge digested. In view of the increasing population, the design load of the works for a population of 800,000 will possibly be reached by 1986; and since the existing oxidation ponds cannot be extended economically, investigations are necessary to determine the best process for the extensions. It is proposed to consider the activated-sludge process.

ON THE CONCEPT OF MUNICIPAL SEWERAGE SYSTEMS,
H. Fathmann.
IWL Forum 66/1, p 1-23, 1966.

Descriptors: *Sewage treatment, *Costs, *Drainage systems, *Equipment, Design.

The author deals with various problems which are encountered in the design and operation of sewage works for local communities. Particular reference is given to the cost of drainage systems and mechanical treatment plants, the control of storm sewage overflows, the operation of screens, detritus, sedimentation and humus tanks, and the advantages of percolating filters and activated-sludge plants.

PRACTICAL ASPECTS OF THE DESIGN OF WASTE STABILIZATION PONDS,
Wooton (L.E.) and Co., Raleigh, N.C.
W. D. Barlow.

Ninth Southern Municipal and Industrial Waste Conference Proceedings (North Carolina State University, Raleigh, North Carolina, April 7-8 1960) p 65-74, Technical Press, Raleigh, North Carolina, 1960.

Descriptors: *Lagoons, *Domestic wastes, Waste water treatment, Industrial wastes, Nutrients, Bacteria, Algae, Treatment facilities, Test procedures, Metals.
Identifiers: *Finishing wastes.

Lagoons can be designed to provide complete treatment for any waste water, domestic and/or industrial, provided it contains the necessary nutrients and is free from substances which are toxic to bacteria or algae. The author discusses the basic processes involved; factors affecting the design and operation of the lagoon (particularly under conditions in North and South Carolina); performance of the lagoon, including methods of measurement; and precautions to be taken to avoid health hazards, pollution and other nuisance problems. In discussion, reference was made to lagoons used for treating mixed waste waters and 20-30 percent of domestic sewage, and especially to the problems encountered which appear to be caused by toxic metals in the waste water. COMBINED TREATMENT OF TEXTILE AND DOMESTIC WASTE,
Cannon Mills, Kannapolis, N.C.
John L. Brown.
Southern Municipal and Industrial Waste Conference Proceedings (North Carolina State University, Raleigh, North Carolina, April 1-2, 1957) p 179-186, Technical Press, Raleigh, North Carolina, 1957.

Descriptors: *Standards, *Legislation, *Waste water treatment, Domestic wastes, Treatment facilities, Lagoons, Trickling filters, Settling basins, Chlorination, Sludge digestion, Textiles.
Identifiers: *Textile wastes, Sodium hydroxide.

Steps taken by Cannon Mills Company to treat plant waste to comply with state stream pollution laws are described. The treatment plant consists of the following units: a storage lagoon for caustic waste, primary settling tanks, two-stage trickling filters, secondary settling tanks, a Cl contact tank, and a sludge digestor. The combined waste being created through the plant is about 60% textile waste and 40% domestic sewage. (Livengood - North Carolina State University)

TARGET DATES FOR SECONDARY TREATMENT AND STORMWATER SEPARATION ON LOWER MISSOURI AND MISSISSIPPI RIVERS,
Glen J. Hopkins.
Paper presented at the annual meeting of the Missouri Water Pollution Control Association, Jefferson City, Missouri, February 23, 1970.

Descriptors: *Water pollution sources, *Pollution abatement, Missouri River, *Mississippi River, *Surface runoff, Water pollution, Sewage treatment, Separation techniques, Overflow, Waste water treatment.
Identifiers: *Agricultural land runoff, Combined sewers.

Sources and effects of pollution in the lower Missouri and Mississippi Rivers are discussed, and reasons for opposing secondary treatment and storm sewer separation for this area are explained. He states that sufficient pollution abatement has already taken place in these rivers and that communities need not waste tax dollars supporting federal grants for further pollution prevention facilities. According to Mr. Hopkins, the Missouri River can assimilate wastes properly with the treatment that is presently offered. He also asserts that sewered wastes, municipal and industrial, and combined sewer overflows cause far less pollution to the rivers than does surface runoff from agricultural lands upstream. Cost of sewer separation for this area is estimated to exceed $250 million.

WOOL GREASE RECOVERY FROM SCOURING EFFLUENT,
Head Wrightson and Co., Ltd., Thornaby (England).
E. B. Chandler.
Patent No 964,430, July 22, 1964.

Descriptors: *Flocculation, Filtration, Chemical precipitation, Waste water treatment.
Identifiers: *Wool scouring, *Wool grease, *Calcium chloride.

Waste water from wool scouring, containing up to 2% of grease at a pH of 10-12 and an oxygen demand of 3-4000 p.p.m. as determined by a four hour permanganate test is treated with calcium chloride so as to give a residual hardness of 1-4000 p.p.m. To improve flocculation and subsequent filtration small amounts of polyelectrolytes or other aids may be added. After removal of solid materials by means of vacuum filtration the waste water contains 10-40 p.p.m. grease and has an oxygen demand of 600-1200 p.p.m. by the permanganate test. The grease may be recovered from the filter cake by solution in chlorinated organic solvents. (Work-North Carolina State University)

A SIMPLIFICATION OF TEXTILE WASTE SURVEY AND TREATMENT,
Wesleyan Univ., Middletown, Conn. Industrial Waste Lab.
J. W. Masselli, N. W. Masselli, and M. G. Burford.
Wesleyan University, Middletown, Conn, 1959. 68 p, 15 fig, 18 tab, 41 ref.

Descriptors: *Water pollution sources, *Water pollution control, *Data collections, *Waste water treatment, Cotton, Pollution abatement, Evaporation, Incineration, Coagulation, Calcium chloride, Activated sludge.
Identifiers: *Pollution load, *Textile mill wastes, Finishing wastes, Wool, Desizing wastes, Kiering wastes, Scouring wastes, Washing wastes, Waste water segregation, Waste water analysis, Dyehouse waste.

This report contains an outline of the processing methods and sources of pollution in the finishing of cotton, wool, and man-made fibers; advice on the simplification of pollution survey methods in the textile industry; an assessment of the range of pollution load from specific processes; and suggestions on the reduction of pollution load and simplification of methods for treating the waste waters. In cotton mills, most of the pollution results from desizing and kiering operations, and in woolen mills, from scouring and washing after fulling; and it is emphasized that the first step towards pollution control should be the modification of processes to segregate these wastes as a single concentrated waste water which would require only small storage capacity to permit equalization of the discharge of BOD over 24 hours instead of shock loads and would also separate the toxic and other troublesome constituents of the weaker effluents which are normally responsible for the great variability in textile waste waters and prevent adequate treatment. The segregated concentrated waste water could be treated by evaporation followed by incineration. The woolen mill waste could be treated by chemical coagulation with calcium chloride and the cotton mill waste, after dilution, by biological filtration or the activated-sludge process. The pollution loads of the remaining weaker effluents, and also of the waste waters from the finishing of man-made fibers, are entirely due to chemicals used in processing; suitable chemicals should therefore be developed which have lower BOD values or are easily removed from the waste waters. Other research should include the development of methods for recovering materials from the waste waters or utilizing the waste waters; the collection of data on the BOD of processing chemicals; and basic research on the reactions of substances primarily responsible for the BOD of the waste waters (principally glucose, soap, and natural impurities). Numerical data are appended on the composition and BOD of the various processing chemicals, the analysis and pollution potential of typical waste waters, and the removal of BOD by chemical coagulation. USE OF SOIL TO TREAT ANAEROBIC LAGOON EFFLUENT: DESIGN AND OPERATION OF A FIELD DISPOSAL SYSTEM,
Iowa State Univ., Ames. Dept. of Agricultural Engineering.
Dale H. Vanderholm, and Craig E. Beer.
Transactions of the American Society of Agricultural Engineers, Vol 13, No 5, p 562-564, Sept-Oct 1970. 1 tab, 2 fig, 17 ref. OWRR Project A-021-IA (3).

Descriptors: *Farm wastes, *Disposal, *Anaerobic digestion, *Irrigation systems, Runoff, Farm lagoon, Livestock, Pollutants, Biochemical oxygen demand, Chemical oxygen demand, Nitrogen, Odor, Storage capacity.
Identifiers: *Land requirements, Livestock wastes.

The study was initiated to investigate the pertinent variables involved and evaluate the performance of an irrigation system for the disposal of livestock waste. It was desired to determine irrigation rates, frequencies, and quantities that would result in satisfactory renovation of the lagoon effluent with no detrimental effects. The results indicate, that for waste-water irrigation, the tabulated rates for clear water are too high and should be reduced, possib

30 to 50 percent. The average COD removal was 97 percent. Smaller applications made more frequently were the most efficient for COD reduction. 80 percent of the nitrogen is removed. 99 percent of the phosphates were removed. This method of waste disposal appears feasible. The results of the study indicate an optimum level for the observed soil and climatic conditions of about 2 in. of lagoon effluent per week during the growing season. (Christenbury-Iowa State)

NDIAN UTILIZES NOVEL MANURE DISPOSAL SYSTEM,
Patel Poultry Farm, Boroda (India).
Jawahar D. Patel.
Poultry Digest, Vol 26, p 100-101, 1967.

Descriptors: *Farm wastes, *Methane, *Gases, Anaerobic digestion, Fertilizers, Odor, Temperature, Disposal, Poultry, Fuels.
Identifiers: India, Working details.

An anaerobic digester that converts poultry manure into useful methane gas is being utilized in India. Poultry manure gives 1.5 to 2.0 cu. ft. of gas per pound in a short period of digestion and at a temperature of 35 degrees C. 35.3 cu. ft. of methane is equivalent to 2.2 kilowatt-hours of electrical energy. The digested manure is a valuable fertilizer because it supplies not only nutrients such as nitrogen, phosphorus, potash, iron, copper, cobalt, maganese, calcium, magnesium, etc., in a well-balanced proportion, but also most valuable humus to plants for successful crop production. THE LARGEST BIOLOGICAL SEWAGE-TREATMENT PLANT ON THE CONTINENT.

Ber Abwassertech Ver (BABVAS), Vol 18, No 2, V, 1967.

Descriptors: *Biological treatment, *Sewage treatment, *Sludge treatment, Channels, Waste water treatment.
Identifiers: Germany.

An account is given of plans for a large biological treatment plant to be built in Essen, Germany, to deal with the increasing quantities of sewage to relieve the existing Emscher plant. The new plant will be able to treat a load of 20 m cubed per second, and during rainfall this amount can be increased to 30 m cubed per second. Provisions have also been made to construct the influent and effluent channels of the mechanical stage in such a way that a loading of up to 45 m cubed per second would be possible. The section where the preliminary treatment is carried out is to be built below ground so that incoming sewage can enter without pumping; the biological stage will then be built above ground and the sewage will be pumped into individual tanks accomodated in 3 buildings. The plan for separate units applies to the whole plant for convenience of necessary repairs. Special provision is made for the separation of oil. Oxygen is supplied mechanically to the aeration tanks, which will have a total volume of 180,000 m; the final sedimentation tanks will also have a volume of 180,000 m cubed. Primary sludge, amounting to about 60% of the total sludge, is to be transported to the sludge-drying plant in Essen-Karnap via a pressure pipeline. Experiments are at present being carried out on methods for disposal of excess activated sludge.

TRANSMISSION PLANT TREATS 100,000 GPD.

Modern Power Eng, Vol 64, No 6, p 64-66, Jun 1970. 2 tab, 1 diag.

Descriptors: *Waste water treatment, *Sewers, *Sewage treatment, *Industrial wastes, Separation techniques, Water distribution (Applied), Storm runoff.
Identifiers: Interceptor sewer.

Prior to installing General Motors' automatic transmission treatment plant, plans were made for the separation of industrial wastes from other liquid wastes. Separation of sewage and sanitary wastes was accomplished by laying interceptor sewers from washrooms to connect to municipal sewers. Stormwater was separated through the construction of an overhead collection system connected to rainwater leaders from the roof. Clean cooling water from production operations was also pumped into this overhead collector and the contents fed to municipal storm systems. Industrial waste purification was accomplished through the installation of the complex waste treatment plant, which is described in detail and which, since September 1968, has passed only treated industrial wastes to municipal sewers.

PHASE 1 EXTENSION WILL CATER FOR EXTRA 1.7 M.G.D. FLOW.

Munic Eng (London), Vol 146, p 756, 1969.

Descriptors: *Sewage treatment, Humus, Sedimentation, Filtration, Waste water treatment.
Identifiers: Great Britain, Storm tank.

An illustrated description is given of extensions in progress to the Tixall sewage works of the Stafford Borough Council, including humus, sedimentation, digestion, and storm sewage tanks, additional percolating filters, and a building to house filter presses. The extended works, which also treats sewage from an area administered by Stafford R.D.C., will have a treatment capacity of 3.6 m.g.d.
W71-06851

COMBINED SEWAGE WORKS OPERATING AT FARINGDON.

Munic Eng (London), Vol 146, p 1221, 1969.

Descriptors: *Sewage treatment, *Storm runoff, *Biocontrol, Waste water treatment.
Identifiers: *Combined sewers, *Effluent discharge, *Biological filtration, Great Britain.

An illustrated description is given of the new sewage works served by a combined sewerage system and provided by Faringdon R.D.C., Berks. Treatment is by biological filtration. The final effluent flows into a stream after discharge to a small irrigation area, and excess stormwater is distributed over a 5-acre seepage site from where it drains to the stream through a clinker bed. Crude sludge is dewatered in drying beds.
W71-06852

FULL TREATMENT CAPACITY INCREASED TO 3.36 M.G.D. BY 29,000-POUND EXTENSION.

Munic Eng (London), Vol 145, p 2090, 1968.

Descriptors: *Sewage treatment, Sludge disposal, Waste water treatment.
Identifiers: *Great Britain, Capacity, Storm sewage.

Recent extensions to the sewage works of Fleet, Hants., which have increased capacity to a dry-weather flow of 1.12 m.g.d., are described. Additional facilities include sludge-drying beds with mechanized removal of sludge, and modifications have been made to humus tanks and percolating filters to provide more working volume. The humus-tank effluent passes through microstrainers before discharge and storm sewage overflows are treated on the land before discharge to a stream.
W71-06853

TIVERTON SEWAGE WORKS RECOGNIZES FLOOD HAZARD.

Surveyor, Vol 84, No 4028, p 30-32, Aug 15, 1969. 7 fig.

Descriptors: *Drainage systems, *Sewage disposal, *Sewers, Flood control, *Multiple-purpose projects, *Treatment facilities, Design criteria, Sludge treatment, Sewage treatment, Waste disposal, Waste water treatment.
Identifiers: *Great Britain.

Extensive main drainage and sewage disposal schemes were completed at Tiverton, Devon. Plans involved relaying of the town's sewers, the provision and renovation of pumping stations, and the reconstruction of sewage disposal works. All three aspects of the work are fully described. Previous town sewers consisted of old brick culverts which were badly silted, and infiltration water entered in places. A complicating factor at Tiverton is that the works are susceptible to flooding from the nearby River Exe. This complication was considered in the design of the works, particularly with regard to sludge treatment. To overcome problems of drying sludge, a method of mechanical drying, called sludge pressing, was installed. A mixture of primary, humus, and stormwater sludges is passed to a chemical conditioning tank where lime and ferrous sulphate solutions are added and mixed with the sludge. The pressing, which takes about seven hours, is performed automatically. The entire procedure is outlined.
W71-06855

DUAL PURPOSE SETTLEMENT TANKS AT ANDOVER.

Surveyor, Vol 83, No 4013, p 29 and 44, May 3, 1969. 1 fig.

Descriptors: *Sewage treatment, *Treatment facilities, Design, Sediment control, Pumping plants, Weirs, City planning, Waste water treatment.
Identifiers: *Storm tank, *Storm overflows, *Great Britain.

Andover's new sewage treatment works embodies four unusual design features, namely, dual purpose primary sedimentation and stormwater tanks, double filtration, elutriation, and filter pressing. As a temporary extension, three sedimentation tanks were constructed to deal with an excess dry weather flow. The original pumping station was converted to a stormwater pumping station, and preliminary treatment units were replaced by an inlet works composed of coarse screens, a bypass channel, flow controlling weirs, and a storm overflow chamber. Flows up to 3 d.w.f. pass to the new main pumping station. Flows between 3 and 6 d.w.f. surcharge and pass to the old station converted for stormwater pumping. Flows exceeding 6 d.w.f. discharge into existing stormwater tanks. The rectangular sedimentation and stormwater tanks were combined into one unit of eight tanks, four back-to-back with a gallery between. Advantages of this system are cited. Descriptions are given of the previous facilities, effluent requirements, temporary extensions, the new main pumping station, the pumping main, the treatment works, primary and secondary treatment, final settlement, sludge digestion, elutriation and conditioning, filter pressing, and landscaping architecture.
W71-06856

ASHFORD (KENT) SEWAGE WORKS AFTER FOUR YEARS.

Surveyor, Vol 83, No 4000, p 38-41, Jan 31, 1969. 3 fig, 1 tab.

Descriptors: *Construction, *Design, *Operations, *Sewage disposal, *Treatment facilities, *Sewage treatment, *Controlled drainage, *Sludge treatment, *Effluents, Storm runoff, Waste water treatment.
Identifiers: *Great Britain.

Major items are presented from a longer paper that described in detail the design, operation, and problems involved in construction of the Bybrook Sewage Disposal Works at Ashford in Kent. In one town served by the old Bybrook works, flows exceeding 6 d.w.f. discharged directly to the old River Stour. Old stormwater storage tanks, previously serving Bybrook only, were improved and a short weir constructed so that all flows pass through both tanks before discharge to the river. Two auto sludge scraping mechanisms aid removal of sludge which is returned along with the tank contents by a stormwater pump to the works for full treatment. The following topics relating to the new disposal works are discussed: trade wastes, the standard of effluent, inlet works, settlement tanks and filters, humus tanks, the irrigation area, stormwater, sludge treatment, commissioning techniques, percolating filters, the digestion plant, mechanical plant problems, the pumps' insides and filter arms grounding. The paper concentrates on early operational problems, but notes that the disposal works' effluent has proven to be excellent.
W71-06857

FARINGDON RDC NEW SEWAGE WORKS.

Surveyor, Vol 82, No 3980, p 54-56, Sep 13, 1968. 5 fig.

Descriptors: *Treatment facilities, *Sewerage, *Sewers, *Overflow, *Controlled drainage, Storm runoff, Waste water treatment.
Identifiers: *Combined sewers, *Storm sewers, *Great Britain, Capacity.

A conventional treatment plant of modern design and large capacity, plus a new and extensive sewerage system replaced a formerly overloaded system at Faringdon in the Berkshires. Additional sewers were provided to relieve the existing system from surcharge and from extremely heavy flows from a new relief road constructed to overcome flooding. Faringdon has a combined sewerage system which must be of a size and capacity sufficient to handle the heaviest storm. The sewage disposal works and sewers leading to the works were designed to handle 3 x dwf. Provision was made for flows over 3 x dwf by constructing large diameter sewers which operate immediately when combined sewers run over. The stormwater sewers do not flow to the disposal works, but discharge onto a stormwater irrigation area. Advantages of this system over the previous one are reported. The new treatment works is described in general, in addition to the procedure used to treat storm flows over 3 x dwf.

NEW SEWAGE DISPOSAL WORKS FOR OAKENGATES U.D.C.

Surveyor Munic City Engrs, Vol 129, No 3920, p 31-32, 1967.

Descriptors: *Sludge treatment, *Sewage treatment, Waste water treatment.
Identifiers: *Great Britain, *Storm tank, *Biological filtration.

An illustrated description is given of a new sewage works at Oakengates, Salop., which provides complete treatment by biological filtration for up to 3 times the dry-weather-flow of 0.8 m.g.d. Primary sludge and sludge from stormwater tanks are discharged to thickening tanks, and secondary sludge is returned for treatment or pumped to the thickening tanks if required. After thickening, sludge is dewatered on beds.
W71-06860

AWARD WINNING INDUSTRIAL WASTE TREATMENT PLANT.

Water Pollution Control, Vol 107, No 7, p 18, Jul 1969.

Descriptors: *Waste water treatment, Ponds, Storm runoff.
Identifiers: *Stormwater pond.

Chrysler's industrial waste treatment plant handles combined storm and industrial waste water. The plant is designed to remove and dispose of free and emulsified oils, detergents, caustic strippers, and acid rinses. A stormwater holding pond of three million gallons stores excess flow from the industrial plant under storm conditions. Exceptionally long and heavy rainfalls could cause the pond to overflow; however, a sufficient detention time would still allow suspended solids to settle out. Stored stormwater is treated later when the plant sewage load has decreased.
W71-06861

RECOVERY OF ZINC SULPHATE IN THE MANUFACTURE OF HIGH-TENACITY RAYON CORD, (RUSSIAN),

A. T. Serkov, I. N. Kotomina, and V. A. Kolchin.
Khimica Volokna, No 5, p 30-32, 1962.

Descriptors: Waste water treatment, Evaporation, Waste treatment, Fibers (Plant), *Water reuse.
Identifiers: *Viscose rayon wastes, *Rayon tire cords, Tire yarns, Zinc compounds, *Zinc sulfate, *Waste recovery.

An economical method is given for recovering zinc by evaporation from waste waters from the production of viscose rayon tire cord. It involves countercurrent washing of the freshly-formed fibers so that a large proportion of zinc sulphate is removed from them, thus substantially reducing the concentration of zinc sulphate in the subsequent bath and hence reducing the volume of water required for its dilution. The process reduces the loss of zinc sulphate to 0.03 kg per kg of fibers, the bulk of zinc sulphate recovered being returned to the spinning bath. A similar process can be applied to the recovery of zinc from effluents produced during the manufacture of other types of viscose rayon fibers. (Livengood-North Carolina State)
W71-06862

OXFORD SEWAGE TREATMENT PLANT.

Water Waste Treat, Vol 12, No 9, p 280-281, Sep/Oct 1969.

Descriptors: *Treatment facilities, *Overflow, Sewage treatment, Regulation, Waste water treatment.
Identifiers: Great Britain.

Extensions of the Oxford Sewage Treatment Plant were required when overloads reached 2 million gallons per day. Now all flows, after preliminary treatment, are pumped to the inlet channel where two-thirds are sent to the old works and one-third to the new works with peak flow/storm balancing tanks acting progressively above 7,000 g.p.m. The dimensions and workings of new units are described. Additions to the plant include: three peak flow/storm balancing tanks, an aeration plant unit, side wall unit extensions to the original flat bottom tanks, infinitely variable speed pumps serving the return activated sludge plant, two hopper bottom tanks, a secondary sludge digestion unit, and three tanker vehicles for conveying consolidated activated sludge.
W71-06863

NEW PUMPING STATION FOR LIVERPOOL.

Water Waste Treat, Vol 12, No 9, p 297, Sep/Oct 1969.

Descriptors: *Pumping plants, *Treatment facilities, *Pumps.
Identifiers: *Great Britain, *Storm tank.

The new pumping station for Liverpool is part of a major extension program which provides further sedimentation tanks, stormwater tanks, and increased biological filtration capacity. The station is designed to accomodate seven vertical sewage pumps, four of which (dryweather pumps) are arranged so as to deliver sewage through one rising main to the primary sedimentation tanks. The three remaining pumps (stormwater pumps) deliver sewage through a second rising main to the stormwater tanks. The operation and output of the pumps are described. Ultraviolet lamps are used to suppress odor and retard any fungoid growth which may occur in the pump house basement.
W71-06864

INSTRUMENTATION AND CONTROL AT DALMARNOCK SEWAGE DISPOSAL WORKS.

Water Waste Treat, Vol 12, No 1, p 19-20, May/Jun 1968.

Descriptors: *Sewage treatment, *Flow measurement, Sludge treatment, Effluents, Waste water treatment.
Identifiers: *Scotland.

The instrumentation and control provided by the Lea Recorder Co. for the new activated-sludge plant at Dalmarnock, Glasgow, are described in detail. Provision has been made for automatic sampling at various stages of treatment, as well as for the control and recording of the flows of sewage, stormwater, and effluent. The final effluent is discharged to the River Clyde.
W71-06865

WATER RE-USE.

Chem Eng Program, Symposium Series, Vol 63, No 78, 1967. 284 p.

Descriptors: *Water reuse, *Water pollution control, *Waste water treatment, *Application methods, *Analytical techniques, Design, Sewers, Sewage treatment.

This publication contains the papers presented at the 59th annual meeting of the American Institute of Chemical Engineers in Detroit, Michigan, during an international conference on the conservation of waste water by reuse, and additional papers from other meetings of the Institute are also included to give broad coverage of the subject. Information on the reuse of waste water for industrial or municipal supplies is presented for 9 countries and consideration is also given to the role of water reuse in the prevention of pollution, management of water resources, and design of sewerage systems; medical, legal, and economic aspects; internal reuse of water in factories; treatment for reuse, including the use of chemicals, ionizing radiation, activated carbon, and biological processes; removal of viruses, phosphates, and nitrogen compounds; reuse in spaceships; recovery of chemicals; analytical techniques; disposal of sludges; and complete reuse of all waste waters including storm sewage.

PROBLEMS OF WATER TREATMENT IN DEVELOPING COUNTRIES,
D. Anderson.
Effluent Water Treat, Vol 8, No 10, p 513-516, Oct 1968.

Descriptors: *Waste water treatment, Waste water (Pollution), Sewage, Public health.
Identifiers: Developing countries.

There will be an increase in the volume of waste water and in the concentration of pollutants due to the increase in the total use of water for municipal, agricultural, and industrial purposes. The problems created by this increase include: development of water resources investigating river morphology and irrigation; sewage waste stressing the reduction of the oxygen consumable in sewage; trade waste water caused by a rapid program of industrialization; equipment and processes wherein design standards used in industrial countries were also applied to developing countries, citing the installation of a treatment plant and an inadequate stormwater system; water and waste water management; and water-borne disease. Research information is needed for combatting the water treatment problems.

EXTRACTS FROM THE ANNALS OF A SEWAGE-WORKS MANAGER, 1950-1966,
T. A. Austin.
Paper presented at a meeting of the Institute of Water Pollution Control, Birmingham, November 1967.

Descriptors: *Sewage treatment, Effluents, Water pollution, Water reuse, Investigations, Biochemical oxygen demand, Waste water treatment.
Identifiers: *Great Britain, Storm sewage, Suspended solids.

An historical account is given of the development of sewage works at Leamington Spa with special reference to the problems encountered. Aspects considered include: the system adopted for charging, conveying, and treating trade waste waters; raising of weirs on storm sewage overflows to overcome pollution of the River Leam; and experiments on the treatment of effluent to permit reuse for industrial purposes. The works now serve a population of 58,000 and treat an average flow of 4.5 m.g.d., with an efficiency of 93.7 per cent (based on BOD). In view of continually increasing loads, a scheme is being developed for a new works, together with a new Avon valley sewer. Trials were carried out using spray-irrigation of screened sewage on grass plots with underdrains which removed 89 per cent of the BOD and 95 per cent of the suspended solids.

SEPARATION OF SEWAGE FROM STORMWATER,
V. W. Bacon, R. Leland, and B. Sosewitz.
In: Symposium on Storm Sewage Overflow, Inst of Civil Engrs, p 143-152, 1967.

Descriptors: *Sewers, *Water pollution sources, Storage, Design, Illinois.
Identifiers: *Storm sewage, *Chicago.

In the U.S., since the conversion from existing combined sewage systems to separate systems would not be economical, various alternate methods of preventing pollution by storm sewage have been investigated. The Chicago underground storage plan followed by back-pumping to surface reservoirs for sedimentation and chlorination is discussed.
W71-06869

ROTARY VIBRATORY FINE SCREENING OF COMBINED SEWER OVERFLOWS; PRIMARY TREATMENT OF STORM WATER OVERFLOW FROM COMBINED SEWERS BY HIGH-RATE, FINE-MESH SCREENS,
Donald M. Marske.
In: Combined Sewer Overflow Abatement Technology. Water Pollution Control Research Series, Report 11024--06/70, p 57-106, Jun 1970. 13 fig, 6 tab, 2 ref.

Descriptors: *Sewage treatment, *Overflow, *Storm runoff, *Screens, Economic feasibility, Treatment facilities, Waste water treatment.
Identifiers: *Combined sewers.

The feasibility, effectiveness, and economics of employing high-mesh screening for primary treatment of stormwater overflow from combined sewer systems is detailed herein. Based on final performance tests run on dry-weather sewage, the unit (63 inches high and an outside diameter of 80 inches) is capable of 99% removal of floatable and settleable solids, 34% removal of total suspended solids, and 27% removal of COD. The screened effluent is typically 92% of the influent flow. The estimated cost of treatment is 22 cents/1000 gallons for a scale-up design of a 25 mgd screening facility. It was observed that the proposed screening facility required 1/10 to 1/20 the land required by a conventional primary treatment plant. (See also W70-09558)

THE DESIGN AND CONSTRUCTION OF REGIONAL SEWERAGE AND SEWAGE TREATMENT WORKS FOR LIVINGSTON NEW TOWN INCLUDING ITS ENVIRONS AND FOR THE NEWBRIDGE AREA,
T. A. C. Brownlie, and W. Ferguson.
J Inst Public Health Engrs, Vol 68, Part 3, p 160-188, Jul 1969.

Descriptors: *Sewerage, Sewage treatment, Design, Overflow, Waste water treatment.
Identifiers: *Storm sewers, *Combined sewers, Treatment methods, Storm tank, Great Britain.

Described in detail are plans for Livingston New Town and its environs and Newbridge. Separate sewers were adopted for the New Town while existing combined systems were re-sewered for separation only when redevelopment took place. Overflows were suggested where major existing sewers were to be connected to newer sewers, and at least 6 d.w.f. will be passed to the new sewer. Primary tanks of the existing sewage treatment works will be converted to storm water tanks and pumps installed to convey stored sewage back to the new sewer. No flows below 18 d.w.f. should reach rivers without treatment. Surface water storm sewers will be built according to the size necessary to drain the 'once a year storm,' even though rain of this intensity and duration is not likely to occur more than once in three or five years. Descriptions are given of the size, capacity, and model of treatment and operation for the numerous parts of the sewage treatment plants proposed. No storm water settling tank is envisaged for the first development, and future expansion and increase in population will determine whether a storm settling tank is required. Partial treatment of 6 x d.w.f. or more will be possible. Capital and operating costs for both treatment plants are tables as are data concerning capacities and dimensions of each treatment mechanism.

CITY OF NORWICH SEWAGE WORKS,
P. Cotton.
Water Pollution Control, Vol 67, No 4, p 454-457, 1968.

Descriptors: *Sewage treatment, *Biocontrol, *Sludge treatment, Waste water treatment.
Identifiers: *Great Britain, *Biological filtration, Storm tank.

An illustrated description is given of the sewage works of Norwich, which are designed to treat a dry-weather flow of 7.5 m.g.d. by biological filtration with recirculation of effluent. Flows in excess of three times design flow are settled in storm tanks. Sludge is thickened by sedimentation before digestion and digested sludge is passed to a storage lagoon before being dried on beds, disposed of on land in liquid form, or distributed by tanker to surrounding farms.

MICROSTRAINING OF SEWAGE EFFLUENTS IN THE USA,
E. W. J. Diaper, and M. R. Lowndes.
Effluent Water Treat, Vol 10, No 6, p 323-325, 327, 328, Jun 1970.

Descriptors: *Filtration, *Waste water treatment, *Pollution abatement, Pollutant identification, Economic justification, Standards, Legislation, Suspended load, Chlorination, Ozone.
Identifiers: *Microstraining, Storm overflows, Chicago, Lebanon, Ohio.

Emphasis has recently been placed on up-grading effluent standards to maintain, or improve, river quality in lieu of increasing contamination from municipal and industrial discharges. Each state must formulate standards for waste water treatment as a result of legislation introduced by the Federal Government. Increased attention has been paid to the compounds of phosphorus and nitrogen in effluents since these chemicals provide nutrients for plant life in the receiving stream. The basic operating principles of a typical microstraining installation are reviewed. The article outlines the results from three investigations in which microstraining has been assessed as an economic aid in preventing pollution in: (1) Lebanon, Ohio - where methods of removing suspended matter that tend to overload advanced waste treatment processes were explored; (2) Chicago - where the necessary tertiary treatment stage at three plants is being being determined in order to meet state standards; and (3) the Cochrane Division of the Crane Co. - where the removal of suspended solids in stormwater overflows by microstraining and the reduction of bacteria in these effluents by chlorination and ozonation are being evaluated.

NEW APPROACHES TO WASTE WATER TREATMENT,
E. W. J. Diaper, and Russel L. Culp.
J Sanit Eng Div, Am Soc Civil Engr, Vol 95, No SA 5, p 978-980.

Descriptors: *Sewage treatment, Storm runoff, Waste water treatment.
Identifiers: Combined sewers, Philadelphia.

In his comments, E.W.J. Diaper mentions the fact that the combination of microstraining and ozonation for the treatment of combined sewer stormwater overflows is being evaluated in Philadelphia, Pennsylvania.
W71-06875

NEW ACTIVATED SLUDGE PLANT TO SERVE THREE WARWICKSHIRE VILLAGES,
Brian M. Dubleton.
Surveyor, Vol 82, No 3972, p 31-33, Jul 19, 1968. 5 fig.

Descriptors: *Sewage treatment, *Treatment facilities, *Separation techniques, Sewers, Drainage programs, Design, Overflow, Waste water treatment, *Activated sludge, Sludge.
Identifiers: *Great Britain, Trunk sewer, Storm tank.

The Atherston Rural District Council constructed a new sewage treatment works and installed several miles of trunk sewers to supercede three existing, overloaded works and to provide for mains drainage in two towns not previously sewered. An activated sludge plant was also proposed for construction. The partially separate sewers in most of the villages were adequate for even anticipated future flows, but in a few instances where surcharging occurred, new sewers were laid. In one area, storm overflows on the sewers were considered to reduce flow to the new works, but separation at the site of the works was found to be preferable. A complete description of the design of the new works is given. Storm tanks can hold the equivalent of 12 hours d.w.f. At times of very heavy rainfall, tanks overflow to Penmire Brook. After a storm, contents of the tanks are returned to the pumping station to be lifted to the works for treatment. The treatment process and sludge handling are described.
W71-06876

SUBMARINE PIPELINE TO DISCHARGE TREATED EFFLUENT AT SPILSBY RDC,
Nigel East.
Surveyor, Vol 85, No 4053, p 38-40, Feb 13, 1970. 10 fig.

Descriptors: *Sewage treatment, *Treatment facilities, *Separation techniques, *Steel pipes, Construction, Outlets, Storm runoff, Sewers, Sewerage, Effluents, Waste water treatment, Waste disposal.
Identifiers: *Great Britain, Storm tank.

Spilsby RDC's sewerage scheme involves two sewage treatment works and construction of a 1.5 mile outfall sewer to dispose of effluent from both works. In one works, storm flows exceeding 3 d.w.f. are separated and passed to storm tanks and additional flows screened only before passing to the final effluent sump. The previous raw sewage, stormwater, and effluent pumping plant was augmented and the filter distributer arms replaced with others of greater capacity. The outlet sewer system was revised to take the effluent to the submarine outfall. Modifications of the second works provided a degree of treatment similar to that at the first works. The bitumen enamel-coated steel submarine pipeline is described in addition to methods used for trench excavation and launching.
W71-06877

TREATMENT OF URBAN STORMWATER RUNOFF,
F. L. Evans, E. E. Geldreich, S. R. Weibel, and G. G. Roebeck.
J Water Pollution Control Fed, Vol 40, No 5, Res Suppl, R162-170, 1968.

Descriptors: *Sedimentation, *Chlorination, Laboratory tests, Microorganisms, Waste water treatment, Ohio, *Storm runoff, Urbanization.
Identifiers: *Cincinnati, Runoff treatment.

Tabulated and graphical results are given of laboratory studies on treatment by sedimentation and chlorination of runoff from an unban area of Cincinnati which is sewered on the separate system. Plain sedimentation for less than one hour was not effective in reducing COD, BOD, concentrations of nitrogen, phosphate and solids, or the total counts of three bacterial indicators, but improved removals were obtained with sedimentation for four hours. A dose of 2-6 mg of chlorine per litre applied for 20 min was necessary to effect a 99.99 per cent kill of total coliform organisms, faecal coliform organisms, and faecal streptococci. Even with such high doses of chlorine and the presence of free residual chlorine after treatment, aftergrowth of total coliform organisms occurred in 24-72 hours; however, there was no significant aftergrowth of faecal organisms. From these results it is suggested that the count of faecal coliform organisms rather than total coliform organisms is more realistic indicator of the downstream effects of chlorinated discharges.

KAPPALA UNDERGROUND SEWAGE WORKS, STOCKHOLM,
E. Isgard, and A. Rosander.
Civil Eng Public Works Rev, Vol 65, No 766, p 517-520, May 1970. 4 diag, 1 map, 1 tab.

Descriptors: *Sewage disposal, *Tunnels, *Treatment facilities, Construction, Planning, Cost analysis, Infiltration, Storm runoff, Waste water treatment, Waste disposal.
Identifiers: *Gravity sewer, Sweden.

Ten suburban communities north of Stockholm formed the Kappala Union to deal with their sewage problems. They planned to convey sewage to a sewage treatment plant on Lidingo Island, enabling effluent to discharge into the main stream of water. Plans are described for the establishment of a system of gravity sewer tunnels to convey waste water to the plant. The flow was intended to consist of municipal sewage and groundwater infiltration without much stormwater. Construction techniques for the sewage tunnels and the treatment plant are discussed, as is the planning of the plant and main pumping station. Total costs for the project are given in a table.
W71-06885

TECHNIQUES AND RECENT DEVELOPMENTS IN SEWAGE WORKS DESIGN,
R. P. Boyd James.
Water Pollution Control, Vol 69, No 1, p 62-66, 1970.

Descriptors: *Sewage treatment, Sludge treatment, Evaluation, Overflow, Waste water treatment.
Identifiers: *Storm tank, *Treatment processes, Storm sewage.

New techniques and developments in three different areas are discussed, the areas being: sewage treatment and its effect on operators and others, the effectiveness of sewage treatment, and the efficiency of the process. Developments in sludge dewatering and aerial nuisance decrease the unattractiveness of sewage treatment to operators and other employees. The advances and deficiencies of tertiary treatment, biological treatment, and preliminary treatment and sedimentation are presented in relation to the influences they have on the effectiveness of sewage treatment. Also in this area, the failings of storm sewage treatment are enumerated, and the author strongly recommends that provisions for storm tanks or irrigation areas be made in order to reduce pollution from overflows. He asserts that it is better to intercept a 40 d.w.f. flow in a storm tank than to give full treatment to a mere 6 d.w.f., allowing the remainder to overflow. F.W. Allen in the 'Discussion,' suggests that storm tank treatment could be improved if full use were made of the storage capacity of sewers and if one storm has no outlet to the river so that the first storm flush could be stored there and later sent back for treatment. He also recommends that overflows sited on a sewer near a trade effluent discharge be upstream of the discharge to allow the trade effluent to pass to the sewage works. New techniques in the efficiency area of sewage treatment are also described in addition to civil engineering developments that speed construction.

SILT REMOVAL FROM COMBINED SEWERS,
D. Laredo, and E. A. Bryant.
Water Sewage Works, Vol 115, No 12, p 561-564, Dec 1968.

Descriptors: *Massachusetts, *Sewage treatment, *Chlorination, Storm runoff, Waste water treatment, Silts.
Identifiers: *Degritting tank, Combined sewers.

At the 50-m.g.d. primary sewage works of Fall River Mass., which is served by combined sewers, a degritting tank and facilities for preliminary additional chlorination have been installed to treat storm flows which previously had to bypass the works because they fouled the sedimentation tanks. The design, operation, and performance of the degritting tank are described.
W71-06887

THE SEWAGE DISPOSAL AT VELDEN ON LAKE WORTHER,
W. Lengyel.
Oesterr Wasserwirtsch (OSWAAI), Vol 20, No 9/10, p 204-210, Sep/Oct 1968.

Descriptors: *Pollution abatement, *Sewage treatment, Pumping plants, Pressure conduits, Waste water treatment.
Identifiers: *Lake Worther, Germany, Combined sewers, Separate system.

To prevent and control polluting loads from entering Lake Worther, additional sewage works were constructed to serve the health resort of Velden. These works provide primary treatment for domestic sewage and trade waste waters in tanks and have facilities for sludge digestion and mixing of sludge and garbage. Owing to the complex geographical conditions of the area, a central pumping station had to be provided to pump the sewage via a long pressure pipe 65 m above water level to the lake. The author outlines the factors which affect the use of combined sewerage systems as compared with separate systems and discusses the advantages and disadvantages. In the case of Lake Worther the separate sewerage system is recommended, but strict control should be kept on the number of dwellings served.
W71-06888

THE UNABATED GROWTH OF WATER POLLUTION ABATEMENT ACTIVITIES,
Austin H. Montgomery, Jr.
Consulting Engr, Vol 33, No 5, p 114-117, Nov 1969. 10 ref.

Descriptors: Methodology, *Pollution abatement, *Sewers, *Costs, *Separation techniques, *Engineering personnel, Water reuse, Waste water treatment.
Identifiers: *Treatment methods.

Water pollution abatement activities were given authority and direction by the Federal Water Quality Act of 1965. An estimated cost of $48 billion is necessary for the separation of combined sanitary and storm sewers. The traditional primary-secondary treatment plants' objectives and achievements usually have been not to restore but to slow down or prevent further degradation. Lack of knowledge of the extent and means of treating pollution sources such as pesticides, acid, erosion, fertilizers, and mine drainage, is a factor in delaying the abatement program. A list of consulting engineering firms, which have been awarded research and development grants and contracts for advanced waste water treatment techniques, is given. The trend in the reuse rather than discharge of waste water is well under way, and the most widespread reuse today is that of secondary treatment effluent as a water source for industry and agriculture. A need for professional water pollution control is emphasized.
W71-06889

SPECIAL OPERATIONAL RESULTS FROM OXIDATION CHANNELS,
J. Muskat.
Oesterr Abwasser-Rundschau (OERAV), Vol 12, No 1, p 3-7, 1967.

Descriptors: *Sewage treatment, Investigations, Nitrification, *Oxidation lagoons, Waste water treatment.
Identifiers: Oxidation channels.

The advantages of oxidation channels for the treatment of sewage are discussed with special reference to the satisfactory results obtained when dealing with shock loads and with rainwater. The principles of action in straight, circular, and mixed oxidation channels are outlined including the difference in the biological conditions of each plant. The importance of dilution for the biocenose in circular channels is considered as well as the factors which affect nitrification and denitrification in straight and in circular channels.

TAHOE AND WINDHOEK: PROMISE AND PROOF OF CLEAN WATER,
Frank P. Sebastian.
Paper presented at the Third Annual National Pollution Control Conference and Exposition, San Francisco, California, Apr 1-3, 1970.

Descriptors: *Sewage treatment, *Water purification, *Treatment facilities, *Water reuse, Cost analysis, Waste water treatment.
Identifiers: *Tahoe treatment plant, *Windhoek treatment plant.

Two sewage treatment plants have shown that technology does exist to meet the stringent environmental quality standards on waste water. By 1970, the Tahoe plant will have pumped one and one-half billion gallons of purified waste water into a new reservoir for water sports and irrigation; and, the Windhoek (South West Africa) sewage purification plant, using a different system, will have supplied nearly one-third of the drinking water for a city of 30,000 people for more than a year. The paper presents illustrations, flowsheets, and cost data on the world's two most advanced waste water treatment plants.
W71-06894

THE REUSE OF TREATED MUNICIPAL WASTE BY THE MIDLAND DIVISION, THE DOW CHEMICAL COMPANY,
E. S. Shannon, and A. Maass.
Paper presented at the Am Water Works Assoc, Annual Conference, Washington, DC, Jun 21-26, 1970.

Descriptors: *Sewage treatment, *Chlorination, *Estimated costs, Water supply, *Water reuse, Water quality, Trickling filters, Waste water treatment, Michigan, *Municipal wastes.
Identifiers: *Midland (Mich).

In June 1969, the Dow Chemical Company started to take into its cooling water and fire protection system the treated sewage from the city of Midland, Michigan. The supplemental water supply will provide up to seven million gallons per day of relatively high quality water and the reservoir will provide a three million gallon fire water supply. The Midland waste water treatment system consists of primary, and two stage trickling filter secondary treatment, followed by chlorination. There is also a three million gallon reservoir, two six thousand gallon per minute pumps, and associated controls and piping. The total cost of the project is estimated at $500,000.

SEWERAGE AND SEWAGE TREATMENT,
Ralph Stone.
'Sewerage and Sewage treatment: State-of-the-Art Abstracts,' J Sanit Eng Div, Am Soc Civil Engr, Vol 96, SA1, p 35-48, Feb 1970.

Descriptors: *Waste treatment, *Sewage treatment, *Abstracts, *Waste water treatment, Activated sludge, Aeration, Oxidation lagoons, Ion-exchange, Operating costs.

Abstracts of 13 on-going research projects are given. The summaries consider activated sludge effluent, clarification processes, ecology in waste stabilization ponds, waste water treatment by ion-exchange resins, plant operating costs, fly ash filters, waste water aeration, individual home waste treatment systems, oxygenation, sulphides, and other problems. This paper has been prepared as an activity of the Committee with significant information on waste treatment, inclusive of subjects of research and demonstration projects.
W71-06897

SEWAGE-TREATMENT PLANT,
G. Talon.
Abwass, Vol 14, No 12, p 17-18, 1967.

Descriptors: *Sewage treatment, *Aeration, *Storage tanks, Equipment, Flow control, Waste water treatment.
Identifiers: Compressed-air lift.

Modifications are examined in relation to preliminary aeration equipment in a sewage-treatment plant. The incoming sewage, instead of passing through a grit chamber and storm-sewage overflow, is conveyed directly to a holding tank, inside of which is a container whose upper rim is at the same height as that of the plant itself. A compressed-air lift, mounted in the holding tank above the bottom of the tank, comprises a vertical shaft with aeration jets. This compressed-air life has a two-fold effect: it lifts the sewage into the treatment tank, and it provides primary aeration.
W71-06898

SOME STRUCTURAL DESIGN CONSIDERATIONS IN OXFORD SEWAGE WORKS EXTENSIONS,
M. G. Tassell.
Surveyor, Vol 85, No 4047, p 31-34, 36, Jan 2, 1970. 7 fig.

Descriptors: *Sewage treatment, *Treatment facilities, *Structural design, *Structural engineering, Waste water treatment.
Identifiers: *Great Britain.

Extensions to the Oxford sewage purification works are discussed. The design approach to two widely differing water rataining structures, the primary settlement and storm/balancing tanks and the elevated wash water tank to the sand filtration unit, are considered in some detail. The common thread was the elimination, where possible, of complex stresses either by introducing hinges or movement joints. Shrinkage cracking is more difficult to avoid. Possible methods of reducing such cracking are discussed. The importance of efficient and continuous curing from the moment the shuttering is struck, or in the case of slabs, from the time of initial set is emphasized.
W71-06899

NEW CONSTRUCTION AND PLANS FOR THE TOWN DRAINAGE OF FLENSBURG,
H. Wagner.
Ber Abwassertech Ver (BABVAD), No 17, p 27-37, 1964.

Descriptors: *Design, *Drainage programs, *Sewage treatment, *Sewerage, Sludge treatment, Waste water treatment, *Overflow, Industrial wastes.
Identifiers: *Germany, Slaughterhouse wastes.

After a brief description of existing sewage works for the town of Flensburg, the author outlines plans for expansion of the sewerage water overflow of 960 litres per sec, also receives heavily polluted waste waters from nearby slaughterhouses, increasing the five-day BOD system in this area. The plant, which at present serves a population of 90,000 with a dry-weather flow of 320 litres per sec, and a storm-to 1200 mg per litre. To reduce the heavy load, the plan includes: additional pumping stations at Galwick; the extension of the pressure pipeline to a length of 1450 m; and a treatment plant equipped for the activated-sludge process, with sludge digestion followed by thickening and drying on beds, and disposal at sea by ships.
W71-06900

TREATMENT STUDIES OF COMBINED TEXTILE AND DOMESTIC WASTES,
O'Brien and Gere, Syracuse, N.Y.
D. T. Lauria, and C. A. Willis.
Proceedings, Nineteenth Industrial Waste Conference, May 5-7, 1964, Purdue University, Layfayette, Ind, Part 1, p 45-58, 1964. 11 fig, 3 tab, 9 ref.

Descriptors: *Biochemical oxidation demand, Pilot plants, Waste water treatment, Textiles, Industrial wastes, Treatment facilities, Biological treatment, North Carolina.
Identifiers: *Textile mill wastes, Valdese (NC).

Pilot plant studies were performed to evaluate a low-loading, completely mixed biological process for treatment of combined domestic and industrial wastes produced in the town of Valdese, N.C. Results indicate that B.O.D. reductions of 90 percent can be obtained up to B.O.D. loadings of at least 2.0 pounds per day of B.O.D. applied per pound of sludge. Approximately 38 percent of the B.O.D. is oxidized and 68 percent is converted to new growth. The sludge endogenous respiration rate is about .8 percent per day. These factors result in an oxygen requirement of 0.55 pounds per pound of removed B.O.D. and a net sludge production of 0.35 pounds of solids per pound of removed B.O.D. Becuase of an alpha factor (K sub La mixed liquor/K sub La water) of 0.5 and proposed operating conditions, aerators must be selected to transfer an equivalent of 3 pounds of oxygen to water at 20 deg and O mg/liter oxygen of each pound of oxygen required in the mixed liquor. Required settling tank loading for sludge removal is about 35 pounds per day sludge solids (dry basis) per square foot of surface area, and excess sludge disposal will be by centrifugation and landfill. Chlorine feed machines must be sized for a dosage rate of 10 mg/liter. (Robinson-North Carolina State University)
W71-06917

DOW SURFPAC PILOT STUDY ON TEXTILE WASTE,
Crompton-Shenandoah Co., Inc., Waynesboro, Va.
Duane W. Snyder.
Proceedings, Eighteenth Industrial Waste Conference, April 30, May 1-2, 1963, Purdue University, Lafayette, Ind, p 476-482, 1964. 5 fig, 2 tab, 2 ref.

Descriptors: *Equalizing reservoirs, Waste water treatment, Textiles, Biochemical oxygen demand, *Pilot plants.
Identifiers: *Dow Surfpac (TN), *Textile mill wastes.

The optimum loading at which the BOD reduction can be maintained is 50% or better. The addition of an equalizing pond should extend BOD reduction into the 60-70 percent range, since capacity will be such as to feed the raw effluent to the treatment facility over a seven-day period. The plant is so designed that a 20 percent addition of Surfpac can be added to the tower if future demands require additional treatment. Also the equalizing basis is designed for aeration if desirable sometime in the future. The full-scale plant will include a final clarifier for removal of sludge produced in the oxidation tower. The waste is pumped from the pershall flume to a storage tank continuously, with the overflow going back into the river below the flume. The tank can also act as an equalizing stage, but the prime purpose is to act as a storage in case the sump pump becomes clogged with lint. The raw waste is pumped to the top of the tower and the overflow goes back into the storage tank. (Robinson-North Carolina State University)

REUSE OF EFFLUENT FROM POLYESTER MANUFACTURING OPERATION,
Fiber Industries, Inc.
R. S. Sahlie, and C. E. Steinmetz.
Modern Textiles, Vol 50, No 11, p 21-28, 1969.

Descriptors: *Trickling filters, *Activated carbon, *Chemical wastes, Phosphates, Domestic wastes, *Water reuse, Water pollution sources, Waste water treatment.
Identifiers: *Algae screens, *Chromate reduction unit, Textile millwastes, Polyester plant wastes, Terephthalic acid compounds, Ethylene glycol, Polymer additives, Methyl alcohol, Finishing agents, Ion exchange resins, Chromium compound, Zinc compounds, Biocides, Dowtherms (TN).

The pilot plant project is to be completed in early 1970 and as of late 1969, it is still too early to draw any conclusions. A list of the various sources and kinds of waste is given. Because the wastes vary in concentration of flow, it is necessary to level out these surges in 3 series - connected equalization basins before permitting the chemical wastes to enter the treatment unit. The equalized chemical waste is then combined with the domestic sewage upon entry to the extended aeration activated-sludge system. The water discharged from the plant is of high quality and appears to lend itself to selected reuse in certain unspecified in-plant processes. The plant includes (1) a chromate reduction unit which removes heavy metals from the cooling tower blowdown, (2) a plastic media trickling filter which is installed to evaluate its efficiency in treatment of polyester wastes, (3) algae screens for the removal of all solids above 40 micron size, and (4) a carbon unit for the final polishing of the water. (Robinson-North Carolina State University)

PILOT-PLANT STUDIES OF PROCESSING WASTES OF COTTON TEXTILES,
George A. Hutton, Jr., and Samuel W. Williams, Jr.
Proceeding of the Southern Municipal and Industrial Waste Conference, North Carolina State University, Raleigh, N.C. p 31-43, Technical Press, Raleigh, N.C., 1969.

Descriptors: *Pilot plants, *Lagoons, *Aeration, *Trickling filters, Waste water treatment, Biochemical oxygen demand, Alkalinity, Detergents, Soaps.
Identifiers: *Chemical treatment, *Recovery (Waste), Waste strength, Biological purification, pH, Carboxymethylcellulose, Starch, Mercerizer waste, Sodium hydroxide, Textile mill wastes, Mercerizing.

Pilot plant studies were run to develop special waste-treatment methods to be standardized against the particular situations occurring in large cotton textile mills. It was desired to reduce both the volume and pollutional load of the waste and to make it more susceptible to biological purification. To reduce BOD, pH, alkalinity and other evidences of pollution, a pilot plant system was equipped with lagoons, aeration, chemical preparation, and tricling filters. In-plant changes were made to prepare for the reduction of the pollution load of the waste, e.g., by substituting carboxymethyl cellulose for starch sizes, detergents for soap in the cleaning and dyeing operations, and similar changes in dyes and finishing agents whenever practicable. It was concluded that the most important future installation will be a caustic recovery unit to reduce the alkalinity of mercerizer waste. Experiments proved the cost of chemical treatment of wastes was too high when compared with biological methods. Results of the studies proved that the cost of full-scale industrial waste treatment was cut to less than one-fourth of the previous estimates. (Robinson - Work, North Carolina State University)

DECOMPOSITION OF CELLULOSE XANTHATE AND PRECIPITATION OF HYDROCELLULOSE DURING PURIFICATION OF WASTE WATERS FROM VISCOSE MANUFACTURE,
O. P. Sinev.
Translated from Khimicheskie Volokny, No 2, 42-44 (Mar-April) 1969. Fibre Chemistry, No 2, Mar-April 180-183, 1969. 15 ref, 2 fig, 1 tab.

Descriptors: *Chemical precipitation, Alkalinity, Limes, Waste water treatment, Waste treatment, *Decomposing organic matter, Cellulose, Water purification.
Identifiers: *Viscose rayon, *Viscose plant wastes, *Cellulose xanthate, Hydrocellulose, Zinc compounds.

In considering the problem of purification of waste waters from the manufacture of viscose rayon, the sequence of decomposition of cellulose xanthate and precipitation of the resulting hydrocellulose must be separately considered. The former can be calculated from the known chemical composition of the cellulose xanthate, especially zinc content, and the temperature and pH of the precipitating bath. The rate of precipitation of suspended hydrocellulose is retarded by the formation of gas bubbles on the particles and this can be counteracted by agitation. When the solution is made alkaline with lime, considerably more rapid coagulation and precipitation takes place. (Work - North Carolina State University)

TEXTILE EFFLUENT TREATMENT WITH FLUE GASES,
Shaw and Marvin Ltd., London (England).
J. S. Franklin, K. Barnes, and A. H. Little.
International Dyer, Vol 142, No 6, 427-432, 1969.

Descriptors: Alkalinity, Waste Water Treatment, Effluents, Textiles, Waste treatment, Hydrogen ion concentration, *Sewage treatment
Identifiers: *Dyehouse wastes, *Mercerizing, Sodium hydroxide, Stack gases, *Textile mill wastes, Sulfuric acid, Caustics.

The effluent waste waters from dyeing operations can be handled satisfactorily by a local sewage treatment plant but the strongly alkaline waste water from the mercerizing operation requires neutralization. About 80 tons of sulfuric acid had been used in other operations and this reacts with the 350 tons of sodium hydroxide in 60 million gallons per year, but this was inadequate. To overcome the difficulty, after a period of experimentation, an absorption tower was built in conjunction with an oil fired boiler. The stack gases from this bubble through a packed column counter to the downward flow of spent mercerizing solution. The resulting waste water had a pH of 8.8 and the operating cost was estimated to be about 12 shillings per 1,000 gallons of effluent treated. (Work-North Carolina State University)

SILICATE TREATMENT FOR ACID MAIN DRAINAGE PREVENTION, SILICATE AND ALUMINA/SILICA GEL TREATMENT OF COAL REFUSE FOR THE PREVENTION OF ACID MINE DRAINAGE.
Tyco Labs., Inc., Waltham, Mass.

Copy available from GPO Sup Doc as EP 2.10:14010DLI 02/71, $1.00; microfiche from Na-

tional Technical Information Service as PB-198 427, $0.95. EPA-WQO Report 14010DLI, February 1971. 94 p, 17 fig, 31 tab, 10 ref, 3 append. EPA-WQO Contract No: 14-12-560.

Descriptors: Waste water treatment, *Silica, *Gels, Mine drainage, Water pollution control, Weathering, Neutralization, *Acid mien water.
Identifiers: *Coal refuse, *Alumina/silica gel, Waterglass.

A treatment technique has been demonstrated on a laboratory scale which inhibits or prevents the generation of acid mine water from waste coal refuse. Three variations of the general method were considered: (1) Neutralization of the water-accessible refuse with a dilute solution of sodium silicate (waterglass), (2) Development of a continuous gel on the refuse surface structure which sealed off the entire pile from natural runoff waters, (3) Development within the pile structure of a continuous silica/aluminia gel to eliminate percolation through the refuse and minimize the effect of natural erosion of the gel structure. Comparison of the effluent water with an untreated pile shows that the neutralized pile was effective for a minimum of 120 in. of equivalent rainfall in inhibiting AMD generation. The surface gel was effective for a longer period of time. The most effective treatment utilized a mixed alumina/silica gel formed within the pile at depths up to 6 in. This method was effective for more than 500 in. of equivalent rainfall, the duration of the test, and appeared to be exceptionally stable at that time. The weathering resistance of the treatment methods was evaluated by heating the gel treated refuse in the laboratory and exposing it to rain, snow, and freeze-thaw cycles outdoors. Extensive washings of the weathered test materials established the fact that the treatments were effective for at least 120 in. of equivalent rainfall (the duration of the test) in preventing AMD generation.

SECONDARY TREATMENT OF HOG WASTE IN AN ANAEROBIC STABILIZATION POND,
North Dakota Water Resources Research Inst., Fargo.
Robert G. Butler.
Available from National Technical Information Service as PB-198 429, $3.00 in paper copy, $0.95 in microfiche. North Dakota Water Resources Research Institute Report WI-221-011-69, December, 1969. 35 p, 4 fig, 11 tab, 44 ref. OWRR Project A-010-NDAK (1).

Descriptors: *Anaerobic conditions, Biochemical oxygen demand, *Oxidation lagoons, Farm wastes, *Bacteria, Waste water treatment, *Anaerobic bacteria, Photosynthetic bacteria, Microorganisms, Chemical analysis.
Identifiers: *Hog wastes.

This study relates the physical and chemical characteristics of the contents of an anaerobic stabilization lagoon to the bacteria that are responsible for the stabilization of the waste. The lagoon is fed by effluent from a settling tank that receives wastes from a hog barn. The lagoon operated as an unheated digester and maintained a pH between 7.2 and 8.1. The Redox potential varied from -370 to -403 millivolts. The mean concentration of volatile acids was 403 mg/l. The average level of BOD for the lagoon water was 566 mg/l. A BOD loading of 3,250 pounds per acre per day did not produce lagoon failure. Sulfate reducers were grown on Postgate's Media E. Methane producing organisms were detected. Photosynthetic organisms were grown on two different media.

MEMORANDUM OF EVIDENCE TO THE MINISTRY OF HOUSING AND LOCAL GOVERNMENT WORKING PARTY ON SEWAGE DISPOSAL.
Committee from the Inst. of Water Pollution Control.

Water Pollution Control, Vol 68, No 6, p 603-609, 1969.

Descriptors: *Water pollution control, *Sewage disposal, *Deterioration, *Sewage treatment, *Treatment facilities, Planning, Storm runoff.
Identifiers: *Separate system, Storm sewage, Great Britain.

The Institute of Water Pollution Control gives evidence on and makes suggestions relating to sewage disposal for a Memorandum to the 'Jeger' Working Party. Topics discussed are divided into five categories: (1) public health, (2) amenity, (3) economic effects, (4) sewage treatment and disposal processes, and (5) administration and standards. Under the section on amenity, the Institute notes that with regard to the amenities of rivers, the major cause of deterioration is the generally inadequate provision for sewage disposal integral with residential and industrial expansion. Even where adequate sewage treatment facilities exist, storm-sewage discharges often impair river amenities. Separate sewer construction is recommended. Methods of sewage treatment are discussed such as: sewage sludge utilization after heated digestion, plus quaternary processes for denitrification, de-salination, and phosphate removal. Other topics covered are: trade effluent control, planning authorities, coastal pollution, settling tank design, and suggestions for investigational research.
W71-06636

GEOLOGIC AND HYDROLOGIC FACTORS BEARING ON SUBSURFACE STORAGE OF LIQUID WASTES IN MARYLAND,
Geological Survey, Parkville, Md.
Edmond G. Otton.
Report available from Maryland Geological Survey, Latrobe Hall, Johns Hopkins University, Baltimore, Md. 21218, $2.75. Maryland Geological Survey Report of Investigations No 14, 1970. 39 p, 10 fig, 6 tab, 57 ref.

Descriptors: *Waste disposal, *Liquid wastes, *Waste storage, *Injection wells, *Maryland, Subsurface investigations, Geology, Hydrogeology, Aquifer characteristics, Water quality, Hydrologic properties, Evaluation, Planning.
Identifiers: *Subsurface liquid-waste storage, *Waste injection wells.

Maryland is divided into 3 major regions and these, in turn are divided into 8 major subregions on the basis of physiography, geology, and hydrology and each is discussed in relation to deep-well injection of wastes. In the Appalachian Region, there are several porous zones that might accept injected wastes, and thick sequences of low-permeability rocks might function as confining layers. In some places there are fresh-water zones that must be considered and in the eastern part of the Western Maryland subregion, there is extensive faulting that might permit vertical leakage of injected wastes. In the Piedmont Region the highly metamorphosed and fractured rocks of the Catoctin Mountain belt offer few opportunities for practicable injection of wastes because of the low permeability and generally ineffective confining layers. In the Coastal Plain Region factors related to waste injection decisions range widely. Most of the aquifers contain fresh water in the Inner Coastal Plain and the number decreases seaward. In the Middle Coastal Plain, there appear to be several saline aquifers below a depth of about 2,000 feet and in the Outer Coastal Plain there are many. Throughout the Coastal Plain Region there are extensive thick confining layers. (Woodard-USGS)
W71-06695

WASTE DISPOSAL--WATER TREATMENT PLANTS (JOINT DISCUSSION).

J Am Water Works Assoc, Vol 58, No 9, p 1102-1116, Sep 1966.

Descriptors: *Waste water treatment, *Waste disposal, *Sludge disposal, *Application methods.
Identifiers: *Detroit, Michigan, Back-wash water.

In a joint discussion at the annual conference of the AWWA in May 1966 several speakers discussed various aspects of the problem of disposing of wastes from water treatment plants without causing pollution. Local factors were taken into account when deciding whether or not such wastes were likely to have an adverse effect on the receiving water. The effects of Pennsylvania state water quality standards and of federal pollution-control legislation on the disposal of wastes from water works were considered, and the methods of disposal at Detroit, Michigan, were described by G.J. Remus. One of the Detroit works is situated on the banks of the Detroit river and the filter wash-water from this plant is discharged directly to the river; since the flow is rapid, the wash-water is dispersed rapidly and there is no evidence of sludge deposits. The wash-water is chlorinated before discharge and is bacteriologically of better quality than the river water. The other three water works are situated away from the river; at the largest of these the filter back-wash water is recirculated for reuse, while at the other two it is discharged to a sanitary sewer, and settled before discharge to a storm sewer, respectively. The sludges from the sedimentation tanks at all the plants are discharged to the sanitary sewers.

10,000 FT LONG SEA OUTFALL AT HASTINGS IN SUSSEX.

Civil Eng Public Works Rev, Vol 63, No 746, p 1003, Sep 1968.

Descriptors: *Outlets, *Pumping plants, Pollution abatement, Pretreatment (Water), Construction, Sewage disposal, Waste disposal.
Identifiers: *Great Britain, Stormwater sump.

A new sewage disposal scheme is under construction to eliminate seashore pollution caused by direct discharges to the ocean through two conventional outfalls. The plan involves pretreatment of sewage after which it is pumped through a long outfall pipe to a point two miles offshore. The pumping station will handle sewage flows up to 6 dwf or 7.5 mgd, and a combination storm weir and automatic penstock will pass excesses to the stormwater pump. A culvert will connect the stormwater sump to the foreshore, and for sea-levels below mid-tide the stormwater will discharge to the sea by gravity. At other times when the culvert is tide-locked, a stormwater pump will operate. Descriptions of physical characteristics, workings, and methods of construction of the long sea outfall and the pumping station are included along with a diagram of the new sewerage scheme.

LAUNCHING A TWO MILE SEWAGE OUTFALL.

Surveyor, Vol 82, No 3978, p 16-17, Aug 30, 1968. 4 fig.

Descriptors: *Drainage systems, *Treatment facilities, Outlets, Water pollution sources, Construction, Pumping plants, Weirs, Storm runoff, Flow control, Costs, Design data, Waste disposal.
Identifiers: *Great Britain.

The Hastings western area main drainage scheme includes a sewerage outfall, two new pumping stations, a partial treatment works, and a pumping main. The scheme was designed to replace two conventional outfalls which caused pollution of the foreshore and shallow water because of insufficient length. The new outfall was built up into seven strings in a special assembly area, and these sections were joined successively before the entire pipe was launched into its final position on the sea bed. Further construction procedures are explained along with the means used to determine the proper length of the outfall. The new pumping station pumps sea sewage flows up to 6 d.w.f., and a discharge to a stormwater sump. The sump connects to the foreshore by a culvert and for sea levels below mid-tide, stormwater discharges to sea by gravity. At times when the culvert is tide-locked, a stormwater pump operates. Costs, dimensions, and other details of the entire scheme are included in the article.

HYDROGEOLOGIC STUDIES ARE KEY TO SAFETY IN WASTE MANAGEMENT PROGRAMS,
Robert E. Bergstrom.
Water Sewage Works, Vol 116, No 4, p 149-155, Apr 1969. 7 fig, 7 ref.

Descriptors: *Groundwater, *Waste disposal, *Water pollution, *Illinois, *Treatment facilities, *Tunnels, Flow control, Aquifers, Data collections, *Hydrogeology, Waste water treatment.
Identifiers: *Disposal operations, *Storm tunnels, *Waste management, Deep tunnel plan, Chicago.

Waste disposal is explored as a possible factor in groundwater contamination. State-reviewed disposal operations in Illinois that are specifically discussed include: landfills and dumps, radioactive waste burial grounds, sewage treatment and waste storage ponds, disposal wells, and sewage-stormwater tunnels. The Chicago Sanitary District's tunnel plan for the prevention of stormwater and raw sewage bypassing treatment plants and polluting streams is described. Initial reports concluded that stormwater and sewage would not pollute the groundwater reservoir because the rock in which the tunnel was bored is tight, and head relations provide that water only moves into and not out of the tunnel. Possible problems created by this project are mentioned. The following suggestions are proposed to aid groundwater practitioners in waste management: (1) the selection of sites for waste disposal based on hydrogeologic conditions which indicate natural safeguards and the protection of health and resources; (2) procurement of data needed to develop criteria for determining geologic conditions and beneficial engineering practices; and (3) the study of investigations relating to waste management topics such as saturation and water movement in typical geologic terrains that might be used for waste disposal.

5F. Water Treatment and Quality Alteration

ELECTRODIALYSIS WATER TREATMENT,
Strategic Air Command, Offutt AFB, Nebr.
Wilbur B. Ruebsamen.
The Military Engineer, Vol 63, No 411, p 34-36, January-February, 1971. 3 p, 6 fig, 2 tab.

Descriptors: *Water treatment, *Water supply, *Groundwater, *Electrodialysis, *North Dakota, Military reservations, Reverse osmosis, Methodology, Evaluation, Salinity, Costs.

Two methods of treatment of groundwater supply at Grand Forks Air Force Base, N.D. are described and evaluated. Electrodialysis is a process using electrodes and semipermeable membranes that permit the passage of either cations or anions. Reverse osmosis is a process using high pressure and a semipermeable membrane. The decision of which unit to use was based on its production performance. The test and failure data show the electrodialysis unit to be superior in performance and reliability. Through use of the electrodialysis water treatment system, the money saved from the maintenance of the old distillation process has paid for the purchase, installation, and operational cost. It is highly reliable, aids in extending the life of other water-using equipment, and is easy to operate and maintain. (Woodard-USGS)

MANUAL OF INDIVIDUAL WATER SUPPLY SYSTEMS.
Department of Health, Education, and Welfare, Washington, D.C.; and Public Health Service, Washington, D.C.

Public Health Service Publication No 24 (1963 Revision). Washington, DC, US Government Printing Office, 1963. 121 p.

Descriptors: *Water quality control, Surface water, Groundwater, Water supply, *Water wells, Drilling, Pumps, Water treatment, Water conditioning.
Identifiers: *Sanitary protection of wells, *Water well construction, Bacteriological quality, Emergency disinfection, Suggested ordinance, Contamination sources.

Developed in cooperation with the Joint Committee on Rural Sanitation, this manual reflects the changing trends in the problems of individual water supply systems and includes additional and new information in this field which has come to the attention of the Public Health Service. While establishing uniform practice among various Federal Agencies concerned with the sanitation aspects of individual water supplies, the manual would also be of use to state and local health authorities, well-drillers, industry groups, and others concerned with the development and operation of such supplies. It emphasizes the sanitation aspects of small supply systems such as those servicing individual dwellings, farms, rural schools or similar institutions, recreational or tourist accommodations, camps, or other installations not having access to public water supply systems. The recommended practices should be helpful in the design, construction and operation of these types of private and quasi-public systems. (Campbell-NWWA)

LEGAL ASPECTS OF WATER SUPPLY AND WATER QUALITY STORAGE,
Virginia Polytechnic Inst., Blacksburg. Water Resources Research Center.
William R. Walker, and William E. Cox.
Bulletin No 37, Water Resources Research Center, Virginia Polytechnic Institute, Blacksburg, Va, August 1970. 235 p, 19 map, 514 ref, 6 append.

Descriptors: *Watershed Protect and Flood Prev Act, *Federal Power Act, *Water supply, *Water storage, Prior appropriation, Riparian rights, Riparian waters, Reasonable use, Relative rights, Administrative agencies, State governments, Beneficial use, Civil law, Municipal water, Federal government, United States, Legislation, Water quality, Water quality control, Water resources development, Cities, Water pollution, Consumptive use, Waste dilution.

The two main objectives of this work are: (1) to investigate the enabling legislation for federal water supply storage and the consequences of storage in federal reservoirs, and (2) to explore the impact of state water law upon federal legislation. There are four federal acts discussed: (1) the Water Supply Act of 1958; (2) the Watershed Protection and Flood Prevention Act; (3) the Federal Water Power Act; and (4) the Flood Control Act of 1944. The functions of the Bureau of Reclamation and the Army Corps of Engineers are discussed in connection with the Water Supply Act. The riparian water right is examined vis-a-vis the appropriative water right. This effort includes analysis of: (1) waters subject to each right, (2) municipal water rights, (3) the right to store water under each doctrine, (4) water supply storage, and (5) the reasonable and beneficial use concepts. The authors also explore the enabling legislation for federal water quality storage, including the 1961 amendment to the Federal Water Pollution Control Act, and storage by federal agencies. The final topic examined is the impact of state water laws on the effectiveness of water quality storage legislation. (See also W71-00480) (Hart-Florida)

DROP INLET REPAIRS STORMS DAMAGE TO SEWER SYSTEM.
Eng Contract Record, Vol 82, No 2, p 26, Feb 1969.

Descriptors: *Damages, *Repairing, *Intakes, Construction materials, *Sewers, *Construction equipment.
Identifiers: *Storm sewers, *Medary, Wisconsin.

In Medary, Wisconsin, a storm sewer, washed out by heavy rainfall, was repaired in twelve days. The Wisconsin Culvert Co. recommended that the now exposed area, which had previously held a 750 foot-long piece of a 72 inch diameter storm sewer pipe, be contained by fabricating a 96 inch diameter drop inlet constructed of 8-gage corrugated galvanized steel, closely riveted and caulked. The drop inlet would connect to the existing 72 inch line by means of a watertight 84 inch diameter, 8-gage galvanized steel pipe, close riveted and caulked, outlet connected at the base of the drop inlet would run 400 feet along the gouged ditch line. The method was approved and immediate fabrication of sections of the drop inlet began followed by trucking of these sections to the site and their installation.

Descriptors: *Contracts, Drainage systems, Flood control, Concrete construction, Cost comparisons.
Identifiers: *Chicago, *Sewer relieving.

Detailed statistics are given concerning bids for a contract to construct sewer drains extending the sewer system in a section of Chicago. Consolidated Construction Co., Inc. won this contract, and it will undertake the project to provide flood relief from a storm of five frequency or less. Inadequate smaller sewers will be replaced, and a number of trunk sewers and siphons will be relieved. The project will be constructed in open cut, and reinforced concrete will be the principal material used. Prices from the two lowest bidders are tabulated for each of the items to be included in the project.

ADDITIONAL INFORMATION-FAILURE OF STORM SEWER SYSTEM.

Water Sewage Works, Vol 117, No 6, p 191, Jun 1970.

Descriptors: *Sewers, *Decision making, Overflow, Wisconsin.
Identifiers: *Storm sewers, *Medary (Wisc).

A description of the storm sewer system situation in Medary, Wisconsin prior to the overflow in June 1968 is given. The article states that the failure of the sewer line in Medary was not due to the design of the storm sewer system, the installation of the pipe, or the type of pipe used. Two reasons are given as to the cause of the overflow: modifications to the storm sewer without informing the consultant engineer; and, lack of knowledge or consideration of hydraulic principles.
W71-06549

RX FOR . . . .

Water Sewage Works, Vol 116, No 12, p 464-465, Dec 1969.

Descriptors: *Construction materials, *Sewers, Storm runoff, Steel, Wisconsin.
Identifiers: *Storm sewers, *Medary (Wisc).

Failure of a concrete storm sewer system in Medary, Wisconsin during a heavy rainfall resulted in property damage and threatened disaster for two major arterial highways. With weather forecasts predicting more storms, officials ordered the construction and installation of a large corrugated, galvanized steel storm sewer. Dimensions and details are given of the system which was installed and operating in 12 days--an unlikely feat to perform using other conduit materials.

OHIO STORMS BURST TWO RESERVOIRS.

Eng News-Record, Vol 183, No 3, p 13, Jul 17, 1969.

Descriptors: *Ohio, *Damages, Storm runoff, Storm drains.
Identifiers: *Storm overflows, Storm sewage.

Severe storms in northern Ohio caused serious damage to 23 counties in the state. In four sections of Bellevue, the heavy rains raised the water table so high that sewage-filled water rose out from the limestone channels of the underground storm drainage system. Residents spent days pumping water off to ditches draining Lake Erie. The flooding also destroyed much of Bellevue's $4.5-million sewage interceptor and treatment plant in addition to damaging reservoirs, bridges, etc. in other Ohio areas.

OHIO RIVER VALLEY WATER SANITATION COMMISSION: SEVENTEENTH, EIGHTEENTH, NINETEENTH, AND TWENTIETH YEARBOOKS.

28 p, 1965; 44 p, 1966; 40 p, 1967; 44 p, 1968.

Descriptors: *Water quality, *Control structures, *Ohio River, *Water management (Applied), Monitoring, Geological surveys, Hydroelectric plants.
Identifiers: *Water quality criteria, Hydrological surveys.

Progress in cooperative work on the management of water quality in the Ohio River valley is reviewed. The 18th yearbook contains the criteria which have been recommended for water quality. Since the Water Quality Act of 1965 required the establishment of water quality standards for the individual states, a major problem is the reconciliation of standards, especially where different standards are applied to the same stretch of river bordering two states. Other projects include: expansion of the system for monitoring water quality, appraising river conditions, and forecasting impending changes some days in advance; development of automated forecasting procedures for management of water quality using a mathematical model; geological and hydrological surveys to determine the potentialities and limitations of deep wells for the disposal of difficult or toxic waste waters; assessment of changes in aquatic life; and, investigations on the enrichment of oxygen in rivers by various methods of operation at hydroelectric power facilities. Each yearbook includes data on the individual water quality characteristics in the Ohio River and its tributaries, and on the present status of municipal and industrial pollution control facilities. The 20th yearbook also contains an article by R. H. Leach, reviewing the accomplishments of the Commission during the 20 years since its establishment.

SEWER MAINTENANCE IN A COLD CLIMATE,
F. E. Ayers.
Journal Water Pollution Control Federation, Vol 41, No 3, p 418-423, Mar 1969.

Descriptors: *Runoff, *Hydrology, *Water pollution sources, Storms, Infiltration.
Identifiers: *Sewer maintenance, *Canada, Combined sewers.

Sewer maintenance problems in Ottawa include threatened explosions due to improper sewer ventilation during snow and sleet storms, the entrance of granular street materials into catch basins and then the sewer systems, and the handling of excess runoff during spring thaws. The problem caused by the entrance of sand and peastone traction materials into the sewer system is greatest in the city's combined sewer district where pipes are older and laid on flatter grades than those of the newer separate system. Means of combating Ottawa's sewer maintenance problems are discussed. Two programs adopted are the crash maintenance program during spring to remove grit in flat sewers, thus allowing sewers maximum capacity for spring runoff; and the development of detained sewer maintenance records which are made available to crews handling sewer problems.

URBAN PLANNING ASPECTS OF WATER POLLUTION,
Sigurd Grava.
New York, Columbia University Press, 1969. 232 p.

Descriptors: *City planning, *Water quality control, *Urban renewal, *Urbanization, Water pollution control.

This study, strictly limited to water-borne wastes and water quality control, represents a synthesis of experience and thought on water pollution as it applies to urban planning and is intended as a guide and source of information for urban planners and community decision makers. Although non-technical in nature, the work includes data, financial and administrative considerations, and reference material.

DYNAMIC MODELING OF STREAM QUALITY BY INVARIANT IMBEDDING,
Kansas State Univ., Manhattan. Dept. of Industrial Engineering.
E. Stanley Lee, and Irving K. Hwang.
Water Resources Bulletin, Vol 7, No 1, p 102-114, February 1971. 13 p, 11 fig, 7 ref.

Descriptors: *Digital computers, *Mathematical modeling, *Dynamics, *Estimating equations, *Water quality, *Stream improvement, Pollution abatement, Biochemical oxygen demand, Dissolved oxygen, Least squares method.
Identifiers: *Invariant imbedding.

Recently developed estimation and nonlinear filtering techniques for the modeling of water quality were introduced. The invariant imbedding concept was used to obtain some useful estimator equations of dynamic stream pollution models. By using these equations, the parameters were estimated directly from differential equations representing the pollution model and from measured noisy data such as BOD and DO. A sequential estimation scheme was obtained whereby only current data were needed to estimate the current or future values of the unknown parameters. Consequently a large amount of computer time and computer memory could be saved and formed an effective on-line-up-dating scheme for the computer modeling and control. Not only the parameters but also concentrations of pollutants could be estimated and therefore formed an effective forecasting technique. The classical least squares criteria were employed to obtain optimal estimates. To illustrate the approach a simple representation of stream quality, proposed by Camp and Dobbins, was shown. The estimation problem was represented by two equations and was solved by the invariant imbedding estimator equations. First the differential equations were integrated by the Runge-Kutta integration scheme and then the results were corrupted with noise. A more general problem was also solved to illustrate the technique. Although a digital computer was used in this work, analog computers could also be used. (Kriss-Cornell)

ENVIRONMENTAL LAW HANDBOOK,
J. Brecher, and M. Nestle.
California Continuing Education of the Bar, Berkeley, Calif, 1970. 343 p, 2 fig, 1 dwg, 3 tab, 1 chart, 523 ref, 3 append.

Descriptors: *California, *Environmental sanitation, *Environment, *Water pollution control, Adjudication procedure, Ecology, Environmental effects, Environmental engineering, Highway effects, State governments, Federal government, Administrative agencies, Legislation, Legal aspects, Water pollution effects, Water pollution treatment, Water pollution sources, Water pollution, Highways.

Evaluated in this book are the following areas: (1) environmental quality; (2) reconstructing the environment; (3) the role of the lawyer in environmental improvement; (4) litigation; (5) administrative proceedings; (6) air pollution; (7) water pollution; (8) open space; (9) other environmental issues, including noise, highways, and hydroelectric power. The author discusses the causes of environmental deterioration, specific crisis areas, and long range deterioration. The following areas are considered with respect to the reconstruction of the environment: (1) the need for reform (2) economic measures, (3) new technology, (4) changes in regulatory authority, and (5) changes in business and industry. The role of the lawyer is examined in environmental advocacy, drafting legislation, and as governmental attorneys. Various procedures, causes of action, and the National Environmental Policy Act are considered with respect to environmental litigation. A discussion of administrative agencies, hearings, and judicial review

is included. The problems of air and water pollution, governmental regulation, and methods of control are evaluated. A chapter deals with preserving privately held open space and public lands. The study concludes with appendices presenting the texts of: (1) the National Environmental Policy Act; (2) interim guidelines for Federal agencies under the Act; (3) Michigan Act No. 127; and (4) a table of federal and state environmental statutes and regulations. ARCTIC HEATED PIPE WATER AND WASTE WATER SYSTEMS,
J. W. Grainge.
Water Res, Vol 3, No 1, p 47-81, Jan 1969.

Descriptors: *Sanitary engineering, *Sewerage, Pipes.
Identifiers: *Canada.

Sanitation problems of communities in Northern Canada are discussed, and some environmental conditions are evaluated. Improvements in sanitation in small Canadian communities by providing piped water and sewage services have been proposed. Two original, relatively inexpensive, all-weather systems suitable where pipes may not be buried on account of soil conditions are described. Ideas and suggestions for planning water and sewerage systems are given.

ENVIRONMENTAL QUESTIONS THAT NOBODY LIKES TO HEAR.

Am City, Vol 85, No 3, p 8, Mar 1970.

Descriptors: *Water pollution, *Costs, Storm runoff, Overflow.
Identifiers: Storm sewers, Sewer separation.

This short review summarizes environmental problems in the United States such as water pollution, refuse collection and disposal, mineral depletion, and air pollution. Under water pollution, it is noted that $48 billion is required to separate sewers in the U.S. in order to correct effects of stormwater overflow. Grim predictions concerning the environment are made, and immediate action to improve conditions is advocated.
W71-06627

SAIGON'S SEWER NEEDS STUDIED.

Eng News-Record, Vol 183, No 5, p 16, Jul 31, 1969.

Descriptors: Investigations, *Water pollution sources, *Drainage systems, Storm runoff, Sewerage, Water pollution control, Sewers.
Identifiers: *Saigon River, Vietnam.

The Agency for International Development (AID) is conducting a 15-month, $800,000 study to discover the most efficient and economic sewer system for the disposal of Saigon's sewage and stormwater runoff. The present system is almost entirely non-functioning and as a result, the waterways of the city, including the Saigon River, are highly polluted with human waste and refuse. One plan to be explored is a drainage canal system for stormwater that would double as a transportation system. The results of the study will be used to support requests for financial assistance for reconstructing Saigon's sewers.

LAKE COUNTY ADOPTS CLEAN LAKE POLICY,
R. E. Anderson.
Water Sewage Works, Vol 115, No 11, p 412-415, Nov 1968.

Descriptors: *Sewage effluents, *Sewage treatment, *Water pollution control, Hydraulics.
Identifiers: *Lake County, Illinois, *Storm sewage, Capacity.

Effluents from sewage works of the North Shore Sanitary District, Lake County, Illinois, will be discharged into the Des Plaines river instead of into Lake Michigan, thus reducing pollution of the lake. Those works giving primary treatment only will be abandoned, and their services absorbed in expansion programs of other works. The capacity for storm sewage flows is to be increased, so that storm sewage will not enter the lake but will be pumped to works for treatment after the storm.

STATUS AND PROPOSED CONTROL OF POLLUTION IN BOSTON HARBOR AND ITS TRIBUTERIES,
John J. Flaherty.
J Boston Soc Civil Eng, Vol 55, No 4, p 221-230, Oct 1968.

Descriptors: *Pollution abatement, Sewerage, Discharge, Overflow, Storm runoff.
Identifiers: *Boston, Separate system, Deep tunnel plan, Combined sewers.

Stormwater overflows from combined sewerage systems and from industrial wastes is the principal cause of river pollution in the Boston area. About 100 outlets into the Harbor and its tributaries are affected by Boston storm overflows and combined sewer discharges from neighboring communities. Four principal alternative methods of pollution abatement for the area are: (1) complete separation of all sanitary sewerage and storm drainage systems, (2) construction of chlorination detention tanks, (3) construction of surface holding tanks, and (4) implementation of the deep tunnel plan. Engineers recommend the construction of sanitary sewers and storm conduits wherever existing principal design flows or runoff from 15-year frequency design rainstorms. The governmental agencies responsible for pollution control, as well as various studies and approaches to alleviation and abatement methods are listed. Results indicated that the most positive method of collecting and disposing overflows of mixed sewage and stormwater is the deep tunnel plan.
W71-06649

ON WATER POLLUTION CONTROL POLICY,
Thomas R. Camp.
Eng News-Record, Vol 181, No 7, p 22-23, Feb 12, 1970.

Descriptors: *Pollution abatement, *Regulation, Storm drains, Sewer separation.
Identifiers: *Construction grants, *Combined sewers, *Viewpoint.

The author criticizes the FWPCA's new policy of refusing construction grants for projects that provide less than 85% removal of five-day BOD, because this requirement does not cover the oxygen demand of ammonia (derived from human urine) or of combined sewer overflows. This policy would eliminate aid to most communities since many areas have combined sewer overflows. Big cities are cited as having the worst water pollution problems because they utilize storm drains as combined sewers, and street congestion hinders sewer separation. Chicago's alternate solution of underground deep rock storage tunnels for sewage is described and praised. The following recommendations are made towards achieving pollution abatement: (1) authorization for grants-in-aid to solve combined sewer problems; (2) mandatory heavy chlorination of sanitary sewage; (3) water pollution control authorities to manage watersheds; and (4) FWPCA's promotion of further legislation required to carry out the above aims.

COOLING WATER SOURCES FOR POWER GENERATION,
Westinghouse Electric Corp., East Pittsburgh, Pa. Power Systems Planning.
Louis G. Hauser.
ASCE Proceedings, Journal of the Power Division, Vol 97, No PO 1, Paper 7804, p 123-133, January 1971. 11 p, 9 fig, 6 tab.

Descriptors: *Water sources, *Cooling water, *Thermal powerplants, Thermal pollution, Systems analysis, Optimization, Electric power production, Nuclear powerplants.
Identifiers: Cooling water sources.

A forecast of thermal discharge growth by type of generation is derived from a forecast of electric generation, an estimate of generation mix, and the expected heat rates for each type of plant. Alternate methods of heat dissipation are explained and economically evaluated in terms of incremental cost additions to a base generation cost for once-through fresh water cooling. Generation cost increases are shown to be less than 5% for each type of cooling except for nonevaporative dry cooling. A survey of plant locations which includes a cost comparison of supplemental cooling at the load center versus power transmission from a once-through cooling water source indicates that approximately 70% of future generating stations will require supplemental cooling systems. Two cases of cooling tower cost optimization performed on a specific plant demonstrate how significant savings on a present worth basis can be obtained when more sophisticated analytical techniques are applied. A SIMULATION TECHNIQUE FOR ASSESSING STORM AND COMBINED SEWER SYSTEMS,
John A. Lager.
In: Combined Sewer Overflow Seminar Papers, Edison, NJ, Nov 4-5, 1969 Water Pollution Control Research Series, Report DAST-37, p 151-170, Mar 1970. 5 fig, 4 tab, 11 ref.

Descriptors: *Simulation analysis, *Assessments, *Computer programs, *Storm runoff, Water pollution control.

This paper describes work in progress to develop an assessment technique for comparing alternate solutions through a comprehensive computerized program capable of 'representing urban storm-water runoff phenomena, both quantity and quality, from the onset of precipitation on the basin, through collection, conveyance (both combined and separate systems), storage, and treatment systems to points downstream from outfalls which are significantly affected by storm discharges'. The program is intended for use by municipalities, government agencies, and consultants as a tool for evaluating the pollution potential of existing systems, present and future, and for comparing alternate courses of remedial action.
W71-06746

A PLAN FOR ENDING LAKE ERIE POLLUTION,
James C. Lamb.
Public Works, Vol 100, No 6, p 79-82, Jun 1969.

Descriptors: *Pollution abatement, Storm runoff, Sewage treatment, Separation techniques, *Lake Erie, Water quality.
Identifiers: Combined sewers.

Sources and effects of pollutants in Lake Erie are described along with plans and recommendations for the elimination of pollution from the lake. Urban runoff and combined sewer overflows are major sources of pollution contributing BOD, bacteria, and nutrients--especially phosphorus. Detroit, Cleveland, and Toledo are the largest offenders in the area of storm water runoff. Suggested state water quality programs are outlined in addition to areas requiring research and development such as: tertiary treatment, nutrient removal, sediment evaluation, pesticide pollution, radioactive and thermal pollution, industrial sludge disposal, oxygen deficient zones, and eutrophication. Expensive separate sewerage systems are recommended only where feasible, such as in redevelopment projects. However, where combined sewers exist, overflows should be disinfected before being discharged to a body of water, and future plans for storage and treatment should be made.
W71-06747

THE 1969 FLOODS,
John A. McCollum.
Calif Water Pollution Control Assoc 42nd Annual Conference, Apr 29-May 1, 1970, Sacramento, Calif.

Descriptors: *Damages, *Sewers, *Storm drains, *Repairing, California, Water pollution control.
Identifiers: *Los Angeles (Calif).

This paper describes the damage to the sewer and storm drain systems in the City of Los Angeles during and subsequent to the winter rains of January and February 1969. Emergency repair work, performed by forces of the Bureau of Sanitation of the Department of Public Works under adverse conditions, resulted in the protection of public and private property from costly damages. Steps taken to insure the health and sanitary condition of the citizenry included restoration of sewer lines, repair to channels and debris basins, and alleviation of slide potential. Damage was also experienced on a county-wide basis and a summary of events shows the interrelationships involved in emergency repair work performed.

UNDERFLOW SEWERS FOR CHICAGO,
Milton Pikarsky, and C. J. Keifer.
Civil Eng, Vol 37, No 5, p 62-65, May 1967. 2 diag, 2 tab.

Descriptors: *Design, *Sewers, *Overflow, *Planning, *Tunnels, Costs, Construction equipment, Computer models, Underflow, Water pollution control.
Identifiers: *Deep tunnel plan, *Chicago, Combined sewers.

Chicago is planning an underflow sewer system consisting of a large tunnel under rivers and canals into which all combined sewers will discharge. This system, costing $400 million dollars, will eliminate the need for a $4 billion dollar conventional separate sewer because spillages from combined sewers will be directed to the underground tunnel rather than polluting surface streams. The performance of the Lawrence Ave. underflow sewers was analyzed through a computer simulation of the system. Untreated overflow into local streams was reduced from 3%/year of the sewage from combined sewers to .8% from Lawrence Ave.'s underflow sewers.

BRITAIN AND THE AMERICAN WATER QUALITY CRISIS,
Richard Wood.
Effluent Water Treat J, Vol 10, No 6, p 316-317, 319-321, Jun 1970.

Descriptors: *United States, *Cost analysis, *Comparative costs, Equipment, Standards, Pollution abatement, Water pollution control.
Identifiers: *Great Britain.

Britain's shortcomings with regard to water pollution control stem from a failure of financial investments in control plants to keep pace with the changing technology of industrial processes and their effects on both domestic and mixed-municipal sewage. A comparative cost analysis between Britain and the United States concerning water pollution control is discussed including: cost percents appropriated for equipment, industrial waste treatment, municipal sewage treatment, and river pollution abatement. Basic purification standards are included as well as effluent standards. The author expands on the idea that the exportation of pollution control equipment such as instrumentation and control systems to the United States is one area in which the British may contribute their technological advances in aiding both the United States and Britain.

MUNICIPALS WANT NEW CENTRAL BODY FOR WATER AND SEWAGE.

Surveyor, Vol 85, p 37 and 48, Apr 1970.

Descriptors: *Future planning (Projected), *Legal aspects, *Regulation, *Administration, Water pollution control.

The setting up of a central body, with much wider responsibilities than those of the present Water Resources Board, to plan, initiate, or coordinate action over the whole field of water resources and sewage purification and disposal, is proposed by the Institution of Municipal Engineers. The following points we discussed: the inadequacy of the present form of organization for the future; water supply and effluent disposal planning; standards research; and the delegation and determination in regards to responsibilities of river boards and local government bodies (i.e. surface water sewerage, positioning of surface water overflows and outfalls).
W71-06762

MERSEY RA STANDARDS FOR EFFLUENTS.
Surveyor, Vol 84, No 4039, p 98, Nov 7, 1969.

Descriptors: *Standards, *Sewage effluents, *Sewage disposal, Overflow, Water pollution control.
Identifiers: *Effluent standards, *Great Britain, Trade effluents, Storm sewage.

The Mersey and Weaver River Authority defined effluent standards in accordance with relevant local conditions. Standards were developed for the following areas: (1) purified sewage effluents discharged to inland rivers (normally applied to rates of flow up to 3 d.w.f.); (2) partially treated sewage effluents discharged to rivers (normally applied to rates of flow in excess of 3 d.w.f.); (3) untreated sewage effluents from storm sewage overflows; (4) sewage effluents discharged to tidal waters; and (5) trade effluents.
W71-06763

NEW AND PROPOSED LAWS,
Paul R. Bonderson.
Paper presented at the Calif Water Pollution Control Assoc, 42nd Conference, Sacramento, Calif, Apr 29 to May 1, 1970.

Descriptors: *Legislation, *Water quality control, *Water pollution control, *Legal aspects, *California, *Water quality act.

The Porter-Cologne Water Quality Control Act, a complete revision of the State's water quality laws, became effective January 1, 1970. The Act accomplishes the following objectives: (1) grants the State Board expanded powers to provide more leadership and greater influence over activities of regional boards; (2) requires regional boards to adopt more restrictive water quality control plans and discharge requirements so that better pollution control will be achieved; and, (3) makes major changes in enforcement procedures, including court assessment of $6,000 per day fines, which will give boards much more effective means for taking enforcement actions. Indications are that over 1,000 environmental quality control bills will be considered during the current legislative session. Consideration will be given to having a State sewage construction grant program. Major proposed water pollution control legislation will be summarized.
W71-06764

THE RESPONSIBILITY OF TREATMENT PLANT OPERATORS UNDER THE PORTER-COLOGNE WATER QUALITY CONTROL ACT,
Jerome B. Gilbert.
Paper presented at the Calif Water Pollution Control Assoc, 42nd Annual Conference, Sacramento, Calif, Apr 29 to May 1, 1970.

Descriptors: *Water quality act, *Water pollution control, Water quality control, *Regulation, *Administrative agencies.

The State Water Resources Control Board and the nine California Regional Water Quality Control Boards are the state agencies responsible for control of water pollution and water quality. The Porter-Cologne Water Quality Control Act greatly strengthens and expands powers and duties of these agencies. Although there are many factors contributing to the degradation of water quality, discharges from municipal and industrial waste treatment plants are still the principal cause of water quality problems. Under the new law, requirements will be made further restrictive resulting in highly sophisticated and more complicated treatment plants. Exacting performance by operators in charge of plants will be needed to prevent violation of requirements and to collect fines up to $6,000 per day. To help assure that qualified operators will be in charge, the State Board will classify all treatment plants and specify the level of competence necessary to operate them. The Board will also specify the training necessary to quality an operator for each level of competence. All operators should take advantage of training opportunities in order to qualify themselves for new levels of operating competence.
W71-06766

ESTABLISHMENT OF WATER QUALITY STANDARDS IN THE CITY OF TAKAMATSU,
Takishi Ishibashi.
Sangyo Kogai, Vol 6, No 6, p 372-382, Jun 25, 1970.

Descriptors: *Standards, *Water quality, *Systems analysis, *Investigations, *Water pollution treatment.
Identifiers: Japan.

An urban river system was employed to establish water quality standards in the Takamatsu area. Normally the standard is established by an investigation of the individual source of pollutants. In large cities where numerous sources exist, an exhaustive investigation is impractical; consequently, an average water quality standard, based on a sampling investigation of primary sources of pollutants, together with considerations of the special properties of the water area are taken as a basis in establishing the individual standard. This new system was effective in expediting the formulation of the standard. The general situation of the water area in question, status of water utilization, water pollution, results of investigations on water quality, pollutants' source, planning of the public sewage system, and future prospects of water pollution are presented. Basic factors considered in establishing and finalizing the water quality standard are given. Discussions made at committee meetings for establishing the standard are also included.
W71-06767

THE SEWERAGE (SCOTLAND) ACT 1968,
Dugald McDonald.
Surveyor, Vol 84, No 4036, p 46-48, and 51-53, Oct 17, 1969. 3 fig.

Descriptors: *Legislation, *Sewerage, *Sewerage disposal, *Sewers, *Prior appropriation, Jurisdiction, Local governments, Water pollution control, Industrial wastes.
Identifiers: *Trade effluents, *Scotland.

The Sewerage Scotland Act is described as a modern, comprehensive code governing sewerage, sewage disposal, and trade effluents. The act is divided into three parts: sewerage, trade effluents, and a supplemental part. The following subjects included in the act are discussed in the first part: local authority to provide sewerage, sewer maintenance, sewers vested in local authority, new sewer construction, sewer connections, joint sewerage and sewage disposal, highway drainage, septic tanks, adoption of private sewage works, defective drainage, abolition of special drainage districts, and prohibition on buildings erected on sewers. The part on trade effluents includes: the right to discharge to sewer, and existing and new discharges. The supplemental section reviews: the rights to sewage, powers of entry, sampling sewage, prohibition on harmful substances, application to the Crown, and settlement of appeals and disputes.
W71-06768

PORTER-COLOGNE ACT REVISITED,
Ronald B. Robie.
Paper presented at the Calif Water Pollution Control Association, 42nd Annual Conference, Sacramento, Calif, Apr 29 to May 1, 1970.

Descriptors: *Legislation, *California, Water quality control, *Water quality act, *Legal aspects, Water pollution control.

The Porter-Cologne Water Quality Control Act, effective January 1 this year, provides the State Water Resources Control Board and the nine California Regional Water Quality Control Boards with the 'tools' to implement and carry out an effective water quality control program. The new law is geared to enhance the water environment as well as to prevent water pollution. This is evidenced by the inclusion of esthetic enjoyment and the preservation of fish, wildlife and other aquatic preserves among the water uses to be protected. Other major provisions of the new law include: civil fines up to $6,000 per day for violation of cease and desist orders relative to a waste discharge; payment of a filing fee not exceeding $1,000 to accompany a report of a proposed or material change in a waste discharge; mandatory cleanup of pollution by a violator with full liability for cleanup costs; and integration of water quality into consideration of water rights, including appropriation of water by storage to be released in order to protect or enhance water quality.
W71-06769

UTILIZATION OF STREAM FOR STORM DRAINAGE,
D. A. Schneider.
Public Works, Vol 98, No 4, p 87, Apr 1967.

Descriptors: *Legislation, Drainage districts, *North Carolina, Water pollution control.

As the Court stated in a North Carolina case, municipalities can be held liable for damages caused by their failure to maintain proper sewer conditions including good drainage and freedom from obstruction. Thus, when a locality utilizes a natural waterway for sewerage and drainage, it is obligated to keep this water in proper condition, and it is liable under the law for damages resulting from neglect to perform this duty.

RIVER ENGINEERING AND WATER CONSERVATION WORKS,
Roland Berkeley Thorn.
Butterworths, London, 1966. 520 p.

Descriptors: *Water supply, *Water conservation, *Engineering education, Legislation.
Identifiers: *River engineering.

The editor collected articles by twenty-three authors, and these, together with his own contributions, form a comprehensive introduction to basic information needed by river authority engineers. The book also includes topics related to water supply engineering and the soil mechanics of flood embankments. With the exception of the first chapter on water conservation and water supply legislation, the emphasis is on engineering subjects and the means for solving major problems arising in river engineering and water conservation works.
W71-06771

THE USE OF BALANCING RESERVOIRS AND FLOW REGULATING RESERVOIRS IN DEALING WITH RUN-OFFS FROM URBAN AREAS,
G. Thompson.
In: River Conservation and Water Conservation Works, Butterworths, London, Chapter 9, p 132-141, 1966. 6 fig, 5 ref.

Descriptors: *Surface drainage, *Flow control, *Regulated flow, *River systems, *Design criteria, Sewers.
Identifiers: *Urban runoff, *Flow balancing.

This chapter attacks the problem of increased runoff from a river caused by urban development and the installation of surface water drainage. Such a problem ensues wherever more paved areas are directly connected by sewers to a river. As a solution, the author recommends flow balancing, which entails passing the flow through a natural or artificial lake with a restricted outflow, or flow regulation, in which part of the river flow is passed into specially-prepared areas. These plans can be economical, and they reduce peak flows and also channel sizes farther downstream. General design factors for implementing flow balancing and regulation are discussed; and then a scheme combining the two principles, which was applied to the River Cray, is described. Flow balancing is possible in new or undeveloped towns; whereas, it cannot

usually be implemented in a built-up area unless lakes or disused mine workings are available. In such urban areas, flow regulation is readily applicable. (See also W71-06771)
W71-06772

APPLIED FLOOD HYDROLOGY,
J. E. Nash.
In: River Engineering and Water Conservation Works, Butterworths, London, Chapter 6, p 63-110, 1966. 22 fig, 1 tab, 23 ref.

Descriptors: *Flood routing, *Rainfall, *Frequency analysis, *Discharge (Water), *Hydrograph analysis, *Unit hydrograph, Storm runoff, Rainfall-runoff relationships.

Two problems in flood hydrology are presented: (1) predicting peak discharges from rainfall data and such other factors as are found necessary; and (2) the determination of the frequency of exceedence of a discharge when records of discharge over several years exist or in the absence of such records. The chapter attempts to designate the tools available for solving such problems and the usefullness and limitations of these tools. Topics discussed under hydrograph analysis are: storm runoff from individual storms, rainfall and effective rainfall, the unit hydrograph hypothesis, changing the duration of a unit hydrograph, use of the S curve, calculation of unit hydrographs from rainfall and stream flow records, and uses of a unit hydrograph. The relation between the unit hydrograph and the catchment is explained, as is the volumetric relation between rainfall and runoff. The last two sections explore flood frequency and the relation of flood frequency to catchment characteristics. (See also W71-06771)
W71-06773

RUNOFF FROM COMBINED RURAL AND URBAN AREAS,
L. H. Watkins.
In: River Engineering and Water Conservation Works, Butterworths, London, Chapter 7, p 111-121, 1966. 5 fig, 4 tab, 4 ref.

Descriptors: *Hydrographs, *Hydrologic aspects, Rational formula, Rainfall.
Identifiers: *Urban runoff, *Great Britain.

Hydrologic principles of the calculation of runoff from rural areas are also applicable to urban and combined rural and urban catchments. However, traditionally urban runoff has been calculated by a variation of the basic method called the Rational Formula or the Lloyd-Davies formula. This formula has been shown to be reliable only for very small urban catchments, and it is being replaced by the R.R.L. Hydrograph method. This chapter discusses the R.R.L. Hydrograph method based on climatic conditions in Great Britain. In order for this method to be applied elsewhere, suitable rainfall data must be employed and adequate allowance made for increased impermeability of natural surfaces, particularly under conditions of tropical rainfall. (See also W71-06771)
W71-06774

STANDARDS FOR EFFLUENTS IN SWITZERLAND,
Eidgenoessisches Institut fuer Reaktorforschung, Wuerenlingen (Switzerland).
P. Courvoisier, and B. Mueller.
Available from NTIS as CONF-700 815, $3.00 in paper copy, $0.95 in microfiche. Presented at IAEA Symposium on Environmental Aspects of Nuclear Power Stations, New York, August 10-14, 1970, 700810-8. Paper IAEA-SM-146/14.

Descriptors: Legislation, *Industrial water, *Thermal pollution.
Identifiers: *Heated effluents, *Nuclear power plants, *Switzerland.

Maximum permissible levels for the release of effluents are stated by different laws, regulations or guide-lines in Switzerland. Policies followed are outlined. A recent addition of general interest is the recommendation of limits for thermal effects in surface waters. As the production of electric energy in Switzerland has been until very recently nearly exclusively by hydro-electric plants, the natural regime of the rivers has not been changed to any appreciable extent by their use as receivers of cooling water. It is possible to use the rivers for the direct cooling of a first group of nuclear power stations. However, the permissible limits for this use of river water had to be identified and fixed in the light of the goals for water protection stated by the Swiss law. A study has demonstrated the need to set up a careful planning for the disposal of heat into rivers.
W71-06792

ODOR CONTROL IN CATTLE FEED YARDS,
W. L. Faith.
Air Pollution Control Association Journal, Vol 14, 1964, p 459-460.

Descriptors: *Farm wastes, *Odor, *Mechanical control, Legal aspects, Spraying, Disposal.
Identifiers: *Feedlots, *Chemical control, Odor counteractants, Masking agents, Disinfectants, Potassium permanganate.

This paper deals with the experimental odor control program initiated in 1961 at the Roy F. Benton Feed Yards in Walnut, California, after complaints were received from a nearby residential area. A variety of methods to reduce odor to an acceptable level have been tried with varying results. A highly satisfactory procedure is based on 'good housekeeping' practices, frequent removal of fecal material, and abatement of residual odor by spraying the lots at designated intervals with a solution of potassium permanganate. Details of the method are discussed. (Christenbury-Iowa State)
W71-06803

ACCELERATION OF NATURAL DRYING OF POULTRY MANURE THROUGH MECHANICAL AGITATION,
California Univ., Davis.
James A. Moore, and Samuel A. Hart.
Unpublished paper. Presented Pacific Coast Region American Society of Agricultural Engineers, 1968. Paper No PC 68-121. 2 fig, 2 ref.

Descriptors: *Farm wastes, *Sublimation, Drying, Moisture content, Till, Winter, Freeze drying, Freezing, Equipment.
Identifiers: Relative humidity, Tiller drying, Natural drying.

Wet manure rather quickly becomes objectionally odorous. One solution to the manure problem would be an economical and efficient means of reducing the moisture content. The concept of sublimation was evaluated as a means of natural drying of poultry manure. The use of a mechanical agitator was incorporated into the system. The drying phenomenon that allows clothes to dry in winter weather would not work with manure. The tiller-drying to accelerate natural drying of manure in summer was very effective. (Christenbury-Iowa State)
W71-06804

CONTROLLING ODORS FROM CATTLE FEED LOTS AND MANURE DEHYDRATION OPERATIONS,
Memphis Cattle Feeders, Inc., Millington, Tenn.
Robert Moorman, Jr.
Air Pollution Control Association Journal, Vol 15, 1965, p 34-35.

Descriptors: *Farm wastes, *Odors, Legal aspects, Dehydration, Spraying, Disposal, Management.
Identifiers: *Feedlots, Public relations.

This paper discusses various methods of odor control for cattle feed lots. The human and physical conditions that exist which allow and cause odor problems to arise and become a community source of trouble are discussed. These include a negative attitude and a lack of understanding on the part of the parties concerned. The odor problems can be alleviated through cooperation and sincere effort. The use of dehydration units have been only partially successful. Public relations between feed lot and the community are very important. (Christenbury-Iowa State)
W71-06805

PROCEEDINGS OF FARM ANIMAL WASTE AND BY-PRODUCT MANAGEMENT CONFERENCE.
Wisconsin Univ., Madison.

University Extension, The University of Wisconsin, November 6-7, 1969. 129 p.

Descriptors: *Farm wastes, *Cattle, *Hogs, *Poultry, *Environment, Social aspects, Economic, Political aspects, Psychological aspects, Air pollution, Water pollution, Soil contamination.
Identifiers: *Management conference.

This conference was held for technical and administrative staff of local, state, regional and federal agencies; for industries and for private citizens who are concerned about or have a responsibility related to the proper management of wastes from farm animal enterprises in Wisconsin. It was an introductory meeting at which the dimensions of the problems were examined, research was reviewed, some alternative manure handling methods were highlighted, public agency roles were outlined and two existing local programs were described. Small group discussions explored future program and research needs. (See also W71-06811 thru W71-06832) (White-Iowa State)
W71-06810

INTRODUCTORY REMARKS,
Wisconsin Univ., Madison. Coll. of Agriculture.
Glenn S. Pound.
In: Proceedings of Farm Animal Waste and By-Product Management Conference, University Extension, University of Wisconsin, November 6-7, 1969, p 15-16.

Descriptors: *Environment, *Agriculture, Industries, Populations, Priorities, Farm wastes, Food abundance, Education, Research and development, Cattle.
Identifiers: Agricultural power, Industrial power, Meat consumption, Public commitment.

The author points out the public commitment which was made and which today has made America the world's greatest agricultural and industrial power. In our progress we have done real harm to our environment. Public awareness is needed to establish new priorities. To establish new priorities will take courage, great understanding and tolerance. Education and research is badly needed. Vast expenditures of money will be required to reverse the tide. (See also W71-06810) (White-Iowa State)
W71-06811

QUANTITIES AND CHARACTERISTICS OF FARM-ANIMAL WASTES,
Public Health Service, Chicago, Ill. Bureau of Solid Waste Management.
Ralph J. Black, and William Q. Kehr.
In: Proceedings of Farm Animal Waste and By-Product Management Conference, University Extension, University of Wisconsin, November 6-7, 1969, p 17-21. 3 tab, 6 ref.

Descriptors: *Farm wastes, *Water pollution, Population, Pollution abatement, Confinement pens, California, Solid wastes, Dissolved oxygen, Water quality, Hogs, Cattle, Poultry, Nutrients, Sewage sludge.

Identifiers: Meat consumption, Livestock production, Population equivalent, Land disposal.

The paper points out that an increased population will require much more beef and poultry, thus increasing the agricultural waste problem. Confinement feeding is firmly established, and, while the number of feeding operations is expected to decline, the total production will be increased. The importance of agricultural wastes is brought out in a table showing quantities of solid wastes generated in California. This is magnified by population equivalent data which states that animal wastes were equivalent in pollutional affect to 10 times that of the nation's population. Data is presented on quantities produced and the nutrient value of animal wastes. It is economically unfeasible to utilize this waste for its fertilizer value. The quantity of animal wastes will increase, as will the management problems associated with its handling, treatment and disposal. (See also W71-06810) (White-Iowa State)
W71-06812

HEALTH PROBLEMS,
Wisconsin Univ., Madison. Dept. of Bacteriology.
Elizabeth McCoy.
In: Proceedings of Farm Animal Waste and By-Product Management Conference, University Extension, University of Wisconsin, November 6-7, 1969, p 22-24.

Descriptors: *Public health, *Farm wastes, *Bacteria, Water pollution, Soil contamination, Coliforms, E. Coli, Streptococcus, Soil, Loam, Rates of application, Sampling, Cores, Adsorption, Percolation.
Identifiers: *Enterocci, Miami silt loam, Die-off.

Animal wastes contain enormous amounts of pollution bacteria. If it finds its way to surface or well waters the water would be reported as 'contaminated.' Bacterial counts made on fresh feces gave the following values: Coliform, 100,000 - 1,000,000/gm.; Enterococci, 1,000,000 - 10,000,000/gm. Experiments were done to trace pollution bacteria in manure applied to soil. Five gallon pails (with bottoms cut out) were set to about three-fourths of their depth in a field of Miami silt loam. Applications of a manure/water slurry were made in 15, 30, and 80 tons per acre amounts. Both types of bacteria were adsorbed with S98..% removal by 14 inches. The soil acts as a very efficient filter. (See also W71-06810) (White-Iowa State)
W71-06813

AESTHETICS AND ODORS,
Wisconsin Dept. of Natural Resources, Madison.
Douglas Evans.
In: Proceedings of Farm Animal Waste and By-Product Management Conference, University Extension, University of Wisconsin, November 6-7, 1969, p 25-26.

Descriptors: *Farm wastes, *Odors, Aesthetics, Anaerobic conditions, Hydrogen sulfide.
Identifiers: *Odor threshold, Public nuisance, Odor panel, Odor measurement.

The difficulty of evaluating the offensiveness of odors is their subjective nature. Odors from farm animal wastes, particularly anaerobically generated are, in general, offensive, but the substances involved and the thresholds of detection are little known. Typical odor thresholds are given when determined by a trained panel. A method is outlined for eliminating panel members insensitive to odors. More needs to be known about the type, quantity and odor threshold of the various compounds involved in farm animal wastes. From this better methods of treating, storing, handling and disposing of wastes may be developed which will reduce or eliminate the odor problem. (See also W71-06810) (White-Iowa State)
W71-06814

DEAD ANIMALS AND HOW THEY CONTRIBUTE TO POLLUTION OF THE ENVIRONMENT,
Department of Agriculture, Madison, Wis.
A. A. Erdmann.
In: Proceedings of Farm Animal Waste and By-Product Management Conference, University Extension, University of Wisconsin, November 6-7, 1969, p 27-29.

Descriptors: Transportation, Costs, Livestock, Legislation, Water pollution, Environment, Wisconsin.
Identifiers: *Dead animal disposal, *Rendering plants, Slaughter plant scraps, Carcasses.

The article describes why dead animals are fast becoming a pollution problem. Where once rendering plants paid to pick up dead animals they now charge livestock owners a fee for pick-up and disposal of livestock losses. The number of dead animals being sent to rendering plants has decreased by about 50%. Some legislation concerning the problem is encouraging. The author expects the problem of dead animal disposal to increase in the future. The problems of the rendering plant industry, such as added labor costs, collection costs, and, perhaps most important, the inferior product resulting from such operations, will probably make it necessary to use a different method of disposal of dead animals than is now followed. (See also W71-06810) (White-Iowa State)
W71-06815

WATER QUALITY PROBLEMS,
Wisconsin Dept. of Natural Resources, Madison.
F. H. Schraufnagel.
In: Proceedings of Farm Animal Waste and By-Product Management Conference, University Extension, University of Wisconsin, p 30-32, November 6-7, 1969. 7 ref.

Descriptors: *Water quality, *Farm wastes, Water pollution sources, Fishkill, Fish, Dissolved oxygen, Nutrients, Nitrogen, Nitrates, Phosphorus, Eutrophication, Base flow, Ammonia, Coliforms, Cattle, Wisconsin.
Identifiers: *Land disposal, Concentrations, Feedlots.

Probably the biggest concern in Wisconsin about pollution from farm animal wastes is because of their nutrients. Nitrogen and phosphorus are the two significant nutrients causing eutrophication in lakes and streams. Land disposal is usually an effective way to prevent pollution except when wastes are applied to frozen ground. Data from the nutrient content of base flows generally indicates that percolation through the ground eliminates most of the phosphorus and nitrogen. The potential for pollution from animal wastes is very great. The likelihood of pollution from cattle will increase with manure fluidization and water carriage systems. The maintenance of water quality depends on research and development of techniques to control the problem. (See also W71-06810) (White-Iowa State)
W71-06816

FUTURE TRENDS IN LIVESTOCK PRODUCTION,
Wisconsin Univ., Madison. Coll. of Agriculture.
Robert W. Bray.
In: Proceedings of Farm Animal Waste and By-Product Management Conference, University Extension, University of Wisconsin, p 33-35, November 6-7, 1969.

Descriptors: *Farm wastes, *Livestock, Cattle, Poultry, Hogs, Automation, Confinement pens, Odors, Waste disposal.
Identifiers: *Livestock numbers, Dairy cattle, Beef cattle, Feedlots, Horses, Waste management.

The author summarizes the article by saying that (1) livestock numbers will increase in the future and (2) the most economical management systems for all classes of livestock will result in larger numbers and more confinement in each livestock enterprise. Thus, the solid waste management or disposal problems associated with livestock production in Wisconsin will become more complex. The author gives his ideas as to what changes in production can be expected for dairy, beef, swine, poultry, and other operations. (See also W71-06810) (White-Iowa State)
W71-06817

WHAT AND WHERE ARE THE CRITICAL SITUATIONS WITH FARM ANIMAL WASTES AND BY-PRODUCTS IN WISCONSIN,
Wisconsin Univ., Madison.
M. T. Beatty, J. E. Kerrigan, and W. K. Porter.
In: Proceedings of Farm Animal Waste and By-Product Management Conference, University Extension, University of Wisconsin, p 36-57, November 6-7, 1969. 4 tab, 12 fig.

Descriptors: *Farm wastes, *Wisconsin, *Spatial distribution, Environment, Soils, Surface waters, Groundwater, Land resources, Livestock, Cattle, Hogs, Poultry, Population, Geology, Hydrology, Precipitation, Standards, Water quality, Nitrogen, Nitrates, Odor, Watersheds, Bedrock.
Identifiers: *By-products, Earth resources, Soil associations, Critical situations.

Where and to what extent various kinds of critical situations develop, depends on the interaction of several components of the waste production and management system. These include: the kinds and amounts of wastes and by-products produced; the spatial distribution of the sources; the proximity to people; the physical environment- characteristics of the soils, the landscape, the surface water and groundwater systems, and; the uses and demands on water and land resources. Numerous tables and charts point up the importance of these components. Seven critical situations, the problems and locations involved, are then explained. They include livestock concentrations near urban areas, large livestock concentrations, livestock in watersheds with lakes, and livestock concentrations on shallow soils over previous bedrock as well as others. (See also W71-05810) (White-Iowa State)
W71-06818

CONSIDERATIONS IN SELECTING DAIRY MANURE DISPOSAL SYSTEMS,
Wisconsin Univ., Madison. Dept. of Agricultural Engineering.
O. I. Berge, E. G. Bruns, T. J. Brevik, and L. A. Brooks.
In: Proceedings of the Farm Animal Waste and By-Product Management Conference, University Extension, University of Wisconsin, p 58-69, November 6-7, 1969. 10 tab, 1 fig, 1 ref.

Descriptors: *Farm wastes, *Cattle, Labor, Odor, Investment, Storage, Storage tanks, Annual costs, Value, Nitrogen, Phosphorus, Potassium, Urine, Equipment, Wisconsin.
Identifiers: *Dairy cattle, *Manure disposal systems, Hauling, Stacking, Manure handling.

Different methods of handling dairy manure and disposing of it are discussed. Advantages and disadvantages are listed. The three basic systems include daily hauling, stacking, and liquid manure storage. Investment and annual costs are compared for the three systems under similar stanchion and free stall housing operations. Dairy manure is valued at $1.40/ton for its nutrient content. Various types of handling equipment are discussed as well as a few disposal methods. (See also W71-06810) (White-Iowa State)
W71-06819

ENGINEERING RESEARCH ON FARM ANIMAL MANURE,
Wisconsin Univ., Madison. Dept. of Agricultural Engineering.
Clyde Barth.

In: Proceedings of Farm Animal Waste and By-Product Management Conference, University Extension, University of Wisconsin, p 70-79, November 6-7, 1969. 2 tab, 6 ref.

Descriptors: *Farm wastes, *Biological treatment, Disposal, Livestock, Anaerobic digestion, Waste storage, Lagoons, Aerobic treatment, Waste dilution, Temperature, Rotors, Irrigation, Odor, Gases.
Identifiers: *Waste management, Waste characteristics, Anaerobic lagoon, Aerobic lagoon, Oxidation ditch, Composting, BOD removal, Land application, Coprophagy, Chemical treatment, Solid-manure waste.

The article reviews different treatment and disposal methods which are currently being used or investigated. Anaerobic and aerobic lagoons are used but are limited by temperature and odor problems. The oxidation ditch can be used for swine but its use is uncertain for wastes from other livestock. Composting, though effective, lacks a market for its finished product. Land application continues to be the most widely used type of livestock waste disposal. Irrigation and plow-furrow-cover applications are a modification of land disposal. Chemical treatment, dehydration, incineration, and coprophagy are being studied, but no conclusions have been drawn. Odor and gas production are problems not well understood and difficult to control. Solid manure, because of the lack of problems associated with its handling, deserves serious consideration in any animal waste handling situation. (See also W71-06810) (White-Iowa State)
W71-06820

NATION-WIDE RESEARCH ON ANIMAL WASTE DISPOSAL,
Federal Water Pollution Control Administration, Chicago, Ill. Lake Michigan Basin Office.
Jacob O. Dumelle.
In: Proceedings of Farm Animal Waste and By-Product Management Conference, University Extension, University of Wisconsin, p 80-81, November 6-7, 1969.

Descriptors: *Farm wastes, *Research and development, Grants, Algae, Air pollution, Water pollution, Soil contamination, Nutrients.
Identifiers: *FWPCA, Activated algae, Feedlots, Oxidation ditch.

The article gives brief descriptions of research projects which the Federal Water Pollution Control Administration is helping to fund. One such project under way in California is trying to determine the practicability of producing and harvesting algae to remove nutrients from agricultural drainage waters. Other projects involve cattle feedlot runoff, and dairy waste waters. Besides research on treatment methods, some projects are trying to find out how much nutrient runs off, and how much gets into water. (See also W71-06810) (White-Iowa State)
W71-06821

WATER RESOURCES CENTER RESEARCH ON ANIMAL WASTES AND WATER QUALITY,
Wisconsin Univ., Madison. Water Resources Center.
J. E. Kerrigan.
In: Proceedings of Farm Animal Waste and By-Product Management Conference, University Extension, University of Wisconsin, p 82-85, November 6-7, 1969.

Descriptors: *Farm wastes, *Water quality, Eutrophication, Research and development, Wisconsin, Legislation, Water resources, Environment, Resources.
Identifiers: *Water Resources Center, Water research.

The function and goals of the University of Wisconsin's Water Resources Center are pointed out. The Center got its start from faculty committees formed to study groundwater and subsequently lakes and streams. It was then assigned state responsibility by the legislature for the coordination and administration of an interagency water resources research and data collection program. Lists of objectives and functions of the Water Resources Center are given. If Wisconsin is to have a well balanced research program for water quality management, it is necessary to direct the limited available financial support to researchers with specially developed talents to solve specific problems that merit consideration. A generous amount of effort must be expended to identify the real problems. (See also W71-06810) (White-Iowa State)
W71-06822

THERE'S HOPE AHEAD,
Wisconsin Univ., Madison. Dept. of Poultry Science.
John Skinner.
In: Proceedings of Farm Animal Waste and By-Product Management Conference, University Extension, University of Wisconsin, p 86-90, November 6-7, 1969.

Descriptors: *Farm wastes, *Odor, Land use, Population, Management, Poultry, Foods, Agriculture.
Identifiers: Manure handling, Public relations, Goals, Land use planning.

Examples are cited of problems which have been turned into profitable industries; this can also be done with animal wastes. The increasing urban population will demand that animal wastes and their associated odors be disposed of at least cost to the meat consuming public. We must first dedicate ourselves to finding answers to the animal waste disposal problem. We must have full realization and appreciation of the cause, extent and consequences of the problem by all concerned. Better land use planning is needed as well as progressive regulations and laws. Better public relations must be created for all of agriculture and agriculturally related industries. Emphasis is placed on realizing the consequences of what we are doing today. The author proposes a goal of 'rendering inoffensive those parts of animal waste and by-products which are disagreeable to the public in general.' (See also W71-06810) (White-Iowa State)
W71-06823

INTRODUCTION TO FEDERAL, STATE AND LOCAL ACTION PROGRAMS TO SOLVE ANIMAL WASTE DISPOSAL PROBLEMS,
Wisconsin Univ., Madison. Dept. of Agricultural Economics.
Douglas A. Yanggen.
In: Proceedings of Farm Animal Waste and By-Product Management Conference, University Extension, University of Wisconsin, p 91, November 6-7, 1969.

Descriptors: *Farm wastes, Water pollution, Agriculture, Environment, Government supports, Cost sharing, Education, Regulation.
Identifiers: *Government programs, Technical assistance, Subsidy.

An introduction is given for following articles on governmental programs which include technical assistance, cost sharing, regulation and education at federal, state and local levels. Those included illustrate the various techniques for influencing private decision making. (See also W71-06810) (White-Iowa State)
W71-06824

THE ROLE OF THE FEDERAL WATER POLLUTION CONTROL ADMINISTRATION IN FARM ANIMAL WASTE AND THE BY-PRODUCT MANAGEMENT,
Federal Water Pollution Control Administration, Chicago, Ill. Great Lakes Region.
Frank E. Hall.
In: Proceedings of Farm Animal Waste and By-Product Management Conference, University Extension, University of Wisconsin, p 92-95, November 6-7, 1969.

Descriptors: *Farm wastes, *Water pollution, Research and development, Federal government, Disposal, Grants, Water pollution control, Lake Erie, Water quality, Standards, Legislation.
Identifiers: *FWPCA, Animal waste disposal, Agricultural practices, Feedlots, Enforcement actions, Water quality standards.

A discussion is presented stating how the programs of the Federal Water Pollution Control Administration relate to farm animal wastes and by-product management. Examples are given of government and in-house research activities. Mention is given of those FWPCA supported activities that relate directly to the control of pollution from farm animals. These include pollution surveillance and water quality monitoring among others. The author feels that the most significant recent accomplishment in water pollution control is the establishment of water quality standards. (See also W71-06810) (White-Iowa State)
W71-06825

TECHNICAL ASSISTANCE AVAILABLE FROM THE SOIL CONSERVATION SERVICE,
Soil Conservation Service, Madison, Wis.
Jack Densmore.
In: Proceedings of Farm Animal Waste and By-Product Management Conference, University Extension, University of Wisconsin, p 96-97, November 6-7, 1969.

Descriptors: *Farm wastes, *Soil conservation, Surface runoff, Diversion, Grassed waterways, Terracing, Waste storage.
Identifiers: *Technical assistance, Soil Conservation Service, Farm waste disposal, Feedlot.

Situations in which technical assistance from the Soil Conservation Service (SCS) might be useful for reducing pollution from farm wastes are listed. Although the list is not all inclusive it gives an idea of assistance that can be obtained. An inventory and analysis of existing and potential areas where farm waste disposal may be a problem is needed. Technical assistance is available from the SCS to help on farm waste disposal problems, under the following limitations: (1) where the solutions involve techniques of soil and water conservation; (2) with the priorities established from time to time by local soil and water conservation district supervisors; and, (3) within the limitations of available man-power. (See also W71-06810) (White-Iowa State)
W71-06826

COST-SHARING UNDER THE AGRICULTURAL CONSERVATION PROGRAM,
Agricultural Stabilization and Conservation Service, Madison, Wis.
Kenneth H. Hoover.
In: Proceedings of Farm Animal Waste and By-Product Management Conference, University Extension, University of Wisconsin, p 98-100, November 6-7, 1969.

Descriptors: *Farm wastes, *Cost sharing, Pollution abatement, Soil conservation, Water conservation, Sedimentation.
Identifiers: ASCS, *Agriculture Conservation Program.

Practices and objectives of the Agricultural Conservation Program (ACP) have been broadened to include pollution abatement, provided such practices also result in soil and/or water conservation. The Agricultural Stabilization and Conservation Service (ASCS) manages program funds of the ACP. A list of components that ought to be included in pollution abatement cost-sharing practices is given. Most practices receive cost-sharing at 80% of cost. Farmer acceptance and financial contribution are needed to accomplish the stated objectives. (See also W71-06810) (White-Iowa State)
W71-06827

THE REGULATORY ROLE OF THE DEPARTMENT OF NATURAL RESOURCES,
Wisconsin Dept. of Natural Resources, Madison. Div. of Environmental Protection.
Thomas G. Frangos.
In: Proceedings of Farm Animal Waste and By-Product Management Conference, University Extension, University of Wisconsin, p 101-104, November 6-7, 1969.

Descriptors: *Farm wastes, *Legislation, Water pollution, Pollution abatement, Wisconsin, Water quality, Regulation, Industrial wastes.
Identifiers: *Department of Natural Resources, Feedlots.

Statutes which point out the authority for Wisconsin water pollution abatement are cited. Other statutes are aimed at prevention and enforcement of sporadic discharges into streams. Based on these statutes, it is clear that the Wisconsin Department of Natural Resources has adequate authority to implement a program of pollution abatement aimed at any source of pollution. Difficulties in implementation include tradition, procedures, and lack of staff and funds. Any solution to the complex animal waste problem will involve a mix of programs, combining regulation, research, education, financial assistance, voluntary actions by landowners and possibly even tolerance on the part of the non-farm population. (See also W71-06810) (White-Iowa State)
W71-06828

COLUMBIA COUNTY PROGRAM,
Columbia County Office, Portage, Wis.
Joe Tuss.
In: Proceedings of Farm Animal Waste and By-Product Management Conference, University Extension, University of Wisconsin, p 105-107, November 6-7, 1969.

Descriptors: *Farm wastes, *Nitrates, Water pollution, Air pollution, Odor, Pollution abatement, Zoning, Wells, Wisconsin.
Identifiers: Feedlots, Livestock concentration.

The Columbia County Extension Service was charged with formulating a 15 man farmer committee to study the present situation in view of pending proposed requirements of animal and agricultural waste disposal. It will make recommendations for preventing agricultural pollution in current problem areas and in expanding agricultural enterprises. A joint program by Columbia County Health Services, Zoning Administration and the University Extension formulated a project to sample well water for nitrates. Over 800 wells have been sampled. Forty-three percent of the high nitrate problem is on farms with high concentration of livestock. The public's demand for clean air, water and environment can be met by programs which involve the items of concern mentioned as well as others. (White-Iowa State)
W71-06829

WHAT ARE THE PROBLEMS IN WALWORTH COUNTY,
Walworth County Zoning and Sanitation Office, Elkhorn, Wis.
James Johnson.
In: Proceedings of Farm Animal Waste and By-Product Management Conference, University Extension, University of Wisconsin, p 108-110, November 6-7, 1969.

Descriptors: *Farm wastes, *Water pollution, *Zoning, Pollution abatement, Eutrophication, Nutrients, Water resources, Land use, Lakes, Urbanization, Education, Erosion control, Land development, Regulation, Wisconsin.
Identifiers: Problem areas, Soil capabilities, Feedlots, Regional Plan.

Increased urbanization resulting in land use conflicts is the overall problem in Walworth County, Wisconsin. As a result, the water resources are deteriorating at an alarming rate. Eutrophication, erosion and nutrient pollution are the major causes. The Regional Plan, properly implemented will regulate growth in such a way as to prevent many problems before they occur. The Walworth County Sanitary Ordinance was a pioneering effort in pollution control which regulated urban growth through the use of soil surveys. The Ordinance will implement zoning by defining 'County Conservation Standards'; which are all of the recommended conservation practices of the Soil Conservation Service. Much can be accomplished with local regulations, but education is essential to sell the program. (See also W71-06810) (White-Iowa State)
W71-06830

ROLE OF UNIVERSITY EXTENSION,
Wisconsin Univ., Madison. Div. of Economic and Environmental Development.
Gale Vandeberg.
In: Proceedings of Farm Animal Waste and By-Product Management Conference, University Extension, University of Wisconsin, p 111-113, November 6-7, 1969.

Descriptors: *Farm wastes, *Environment, Education, Universities, Research and development, Regulation, Water pollution, Wisconsin.
Identifiers: *University Extension, Adult education.

The challenge to Extension lies in the broad and continuous education of the public so that a pleasing and healthful environment may be maintained. The University Extension combined with the technical, financial and regulatory resources of other state and federal agencies has the resources to reduce the animal waste management problem. The University Extension staff has the responsibility to help various groups and the public to understand the problems and the alternatives; to help people who need to organize for action to do so; and to help groups and individuals to know what they can do, how to do it, and what resources are at their disposal. (See also W71-06810) (White-Iowa)
W71-06831

WHERE DO WE GO FROM HERE,
Wisconsin Univ., Madison. Dept. of Meat and Animal Science.
Richard H. Vilstrup.
In: Proceedings of Farm Animal Waste and By-Product Management Conference, University Extension, University of Wisconsin, p 114-115, November 6-7, 1969.

Descriptors: *Farm wastes, *Environment, Wisconsin, Technology, Education, Research and development, Regulation, Legislation.
Identifiers: Waste management, Waste utilization.

The author attempts to briefly summarize the ideas and presentations made at the conference. He points out that the waste management problem has many dimensions, including environmental, social, economic, physical, political and psychological. There is an increasing concern for the quality of environment in Wisconsin. As such, research and education are needed in many areas. Five specific recommendations for continued emphasis in the waste management area are made. Recommendations are also made for educational development. (See also W71-06810) (White-Iowa State)

WATER SUPPLY AND WASTE DISPOSAL,
W. A. Hardenbergh, and Edward B. Rodie.
International Textbook Company, Scranton, Pa, 1969. 513 p.

Descriptors: *Water supply, *Waste disposal, *Sanitary engineering, *Design, *Operations, *Industrial wastes, *Waste water treatment.

This volume presents the theory and practices relating to the interrelationship between the basic problems of water supply and waste disposal. The authors provide an integrated treatment of the fundamentals common to both of these areas of sanitary engineering. Detailed are the design and operation of systems for water supply and waste disposal. Problems in water supply caused by over-population and expansion plus unusual disposal dilemmas created by increased amounts of industrial waste products are described, and some solutions are proposed. The first nine chapters concern basic principles of water supply and waste disposal including: water use and sewerage volume, piping for water and sewage systems, and the collection and storage of water. The last fourteen chapters relate to either problems or solutions such as: water treatment by screening and sedimentation; control of corrosiveness, taste, and odor; sludge treatment and disposal; filtration and disinfection of water; removal of dissolved minerals from water; the activated sludge process; and primary and secondary sewage treatment. (See also W71-06880 thru W71-06884)

THE WATER-SEWAGE CYCLE,
W. A. Hardenbergh, and Edward B. Rodie.
In: Water Supply and Waste Disposal, International Textbook Company, Scranton, Pa, Chapter 1, p 1-7, 1960. 4 fig, 6 ref.

Descriptors: *Water supply, *Sewage disposal, *Storm drains, *Sewage treatment, *Water treatment, Separation techniques.
Identifiers: *Storm sewers.

This chapter enumerates the functions of water supply and sewage disposal systems and discusses terminology, financing, and other elements of each system. A section on storm drainage recommends the provision of separate sewage and stormwater systems when sewage treatment is required. General information on water and sewage treatment is also included in this chapter. (See also W71-06879)
W71-06880

QUANTITY OF WATER FROM RAINFALL,
W. A. Hardenbergh, and Edward B. Rodie.
In: Water Supply and Waste Disposal, International Textbook Company, Scranton, Pa, Chapter 2, p 8-39, 1960. 13 fig, 6 tab, 11 ref.

Descriptors: *Rainfall, *Snowfall, *Runoff, *Streamflow, *Measurement, *Water yield, *Surface waters, *Water quality, *Rainfall disposition, *Storm drains, *Design, *Rational formula, *Runoff forecasting, Groundwater, Percolation, Evaporation, Absorption.

The first three sections of this chapter involve rainfall and snowfall, rain measurement, and rain making. Next, runoff is described with a method for measuring streamflow. Other sections discuss the estimation of watershed yield, empirical formulas for runoff of water supply, an investigation of the source for yield, and the quality of surface water. Rainfall-runoff proportions, along with rainfall rate and duration, are cited as important criteria for designing storm drainage facilities. Techniques for computing these three elements are given including the Rational Method and the Burkli Zeiger empirical formula for determining runoff. Other topics treated in the chapter include: percolation and absorption, evaporation, and groundwater. (See also W71-06879)
W71-06881

HYDRAULICS OF WATER AND SEWER CONDUITS,
W. A. Hardenbergh, and Edward B. Rodie.
In: Water Supply and Waste Disposal, International Textbook Company, Scranton, Pa, Chapter 4, p 59-72, 1960. 5 tab, 3 fig, 2 ref.

Descriptors: *Pipe flow, *Pipes, *Sewers, Mannings equation, Hydrualic design.
Identifiers: *Sewer hydraulics.

General formulas describing the flow of water in pipes are used to compute pipe sizes. Such formulas and other aspects of flow in water pipes are presented in this chapter. Flow in sewers is described specifically with reference to the Manning Formula and other formulas. Additional topics discussed are: limiting velocities in sewers, and the design of full and partly filled sewers excluding circular sewers. (See also W71-06879)
W71-06882

PIPING FOR WATER AND SEWER SYSTEMS,
W. A. Hardenbergh, and Edward B. Rodie.
In: Water Supply and Waste Disposal, International Textbook Company, Scranton, Pa, Chapter 5, p 73-98, 1960. 22 fig, 3 tab, 10 ref.

Descriptors: *Water supply, *Construction, *Construction materials, *Sewers, Design, Piping systems (Mechanical).
Identifiers: Pipe construction.

Requirements for the construction of water supply and sewer pipes are listed, and descriptions of the most commonly-used materials are included. Cast-iron, asbestos-cement, concrete, and steel are discussed in terms of their use in water supply pipe construction. Vitrified-clay, concrete, and asbestos-cement are described for sewer pipes. Other topics in this chapter are: service pipes, electrolysis, water hammer, the thickness of metal pipe, appurtenances for water systems (valves, meters, hydrants) and for sewers (manholes, drop manholes, inlets, catch basins, flush tanks, diverting weirs, inverted siphons, and outlets), junctions of large sewers, loads on pipes in trenches, and the testing of sewer pipe strength. (See also W71-06879)
W71-06883

COLLECTION AND TRANSPORTATION OF SEWAGE,
W. A. Hardenbergh, and Edward B. Rodie.
In: Water Supply and Waste Disposal, International Textbook Company, Scranton, Pa, Chapter 8, p 161-190, 1960. 3 tab, 8 fig, 4 ref.

Descriptors: *Sewerage, *Sewers, *Storm drains, *Design standards, *Specifications, Runoff, Time of concentration, Construction, Measurement.
Identifiers: *Storm sewers, *Capacity, Combined sewers, Curved sewers.

Subjects discussed in this chapter include: the layout of a sewerage system, the position of the sewer in the street, the procedure for establishing layout, and the design of sanitary sewers. Also described is the design of a storm drainage system including information of the inlet time or time of concentration, runoff, sizes and gradients of storm sewers, and inlet capacity. Combined sewers, noted to be rarely-built, follow the same design as that for storm sewers although their shape may be modified. Sewer construction, infiltration measurement, records, and curved sewers are additional topics explored. (See also W71-06879)

DETROIT'S METROPOLITAN WATER POLLUTION CONTROL PROGRAM - IN ACTION,
Gerald J. Remus.
The Engineer and the City, p 91-96, 1969.

Descriptors: Water pollution control, *Cities, Project planning, Multiple-purpose projects, *Sewerage, *Storm runoff, *Control systems, *Sewage disposal, Estimated costs, *Construction costs, Instrumentation, Waste water treatment.
Identifiers: *Detroit, *Combined sewers.

The adoption of metropolitan programs for water supply, pollution control, and sewage treatment in the Detroit area received its impetus in 1959. A brief review of the growing acceptance of the programs is given. The sewage system for Detroit operates on a combined stormwater-sanitary sewage basis with the use of remote controls, automatic alarms, and computer recordings (including records on how a storm crosses a metropolitan area). The stormflow dirt deposit to the Detroit River has been reduced by at least 15%: and because of the sewer control instruments flooding of the activated sludge process at the plant. Approximately $371 million will be spent from 1966 to 1975 on this water pollution control program. Recommendations for further studies and programs are made by the author, and an estimated cost list on the sewage disposal construction (1968-1970) is given.

DEVELOPMENTS IN STORM AND COMBINED SEWER POLLUTION CONTROL,
William A. Rosenkranz.
Paper presented at the Spring Meeting of the New England Water Pollution Control Association, Jun 11, 1968.

Descriptors: *Water pollution control, *Sewage treatment, Application methods, Waste water treatment.
Identifiers: *Stormwater pollution, *Combined sewage, Sewer separation, Storm sewers.

Three basic approaches used to minimize combined sewage or stormwater pollution are defined as: (1) control, (2) treatment, and (3) combinations of the two. Examples are given under each category. Considering progress thus far, it is unlikely that any single control or treatment method developed will successfully solve combined sewer or stormwater pollution problems. Instead, methods providing whole or partial solutions based on particular circumstances of the area will be integrated into the combined sewer or stormwater project. Methods of control and/or treatment described include: screening, disinfection, sedimentation, in-system storage, off-system storage, chemical treatment, automated regulators, and sewer separation. Sewer separation continues to maintain the widest amount of present and planned use and predicted applicability.

NEW INFORMATION NEEDS FOR WATER MANAGEMENT IN URBAN REGIONS,
John R. Sheaffer.
Paper presented at the Am Geophys Union - 1969 National Fall Meeting.

Descriptors: *Water management (Applied), Investigations, *Michigan, Pollutants, Planning, *Regions, Water pollution control, *Cities, Urbanization.
Identifiers: *Urban water resource management.

To illustrate the new information needs for water management in urban areas, a case study of a waste water management plan is described and the types of data required in the formulation of the plan are identified. Muskegon County, Michigan, is the study area. The basic management concept set forth in the research creates new information needs. The concept is one of utilizing pollutants as resources out of place and, thus, converting them into economic goods. This goal is accomplished by taking the waste from the water, processing it, and putting it on the land, where it becomes useful and valuable. The environmental implications and the data needs for such a program can be viewed readily in the context of this new type of urban water resource management. It is obvious that adjustments in mapping techniques will be necessary to accommodate future management efforts.

WATER: INDUSTRY CHALLENGE - TODAY,
S. M. Suckecki.
Textile Industries, Vol 130, No 6, p 108-110, 1966.

Descriptors: Water quality, Legal, *Water quality act, Industrial wastes, *Water pollution.
Identifiers: Textile mill wastes.

The Water Quality Act of 1965 is the basis of federal water quality standards. The current (1966) daily consumption of water is about 355 billion gallons, of which about 160 billion is used by industry. In 1980 it is estimated these figures will reach 600-650 and 395, respectively. The textile industry requires large amounts of water, and several organizations such as the American Associaton of Colorists and Chemists are supplying information to the industry. ERROR ANALYSIS AND SYSTEM IDENTIFICATION OF WATER BALANCE AND THE RAINFALL EXCESS COMPONENT IN REAL AND MODEL WATERSHEDS,
Arizona Univ., Tucson. Dept. of Hydrology and Water Resources.
Chester C. Kisiel, Hasan K. Qashu, and James J. Rogers.
Research Report, Presented at Fall National Meeting of the American Geophysical Union, San Francisco, California, December 7-10, 1970. 28 p, 1 fig, 26 ref. OWRR Project B-007-ARIZ (9).

Descriptors: *Water balance, *Rainfall-runoff relationships, *Hydrologic budget, *Estimating, *Time, *Decision making, Flood control, Water yield, Sampling.
Identifiers: *Error analysis, *Bayesian theory, Space.

For purposes of estimating water balance and flood hydrographs in determination of the water yield or rainfall excess component classical methods were reviewed in the light of recent developments in parameter estimation theory (including the theory for unscrambling of observed time series) and decision theory. Theoretical and practical aspects of budget equations as used in the analysis of discrete events (such as a single rainfall-runoff pairs over a period of hours or days) and in the analysis of hydrologic budgets over much larger time units such as a month and year were also reviewed. Considered were measurement and sampling errors and time-dependency in a scientific and decision framework, and the effects of noisy instruments and sampling variability in space and time as a function of physically-meaningful parameters. Error propagation was discussed in terms of reliability of water yield estimates. The Bayesian framework which addresses itself to the 'best' action, design, or decision in the face of overestimation and underestimation errors around an unknown true value estimate was cited as a possible resolution to small sample estimation error. SYSTEMS THEORY: A NEW APPROACH FOR MODELLING WATERSHEDS REALISTICALLY,
Arizona Univ., Tucson. Dept. of Hydrology and Water Resources.
James J. Rogers, Hasan K. Qashu, and Chester C. Kisiel.
Research Report, December 1970. 9 p, 1 fig, 12 ref. OWRR Project B-007-ARIZ (10).

Descriptors: *Mathematical models, *Watersheds (Basins), *Systems analysis, *Hydrologic aspects, Input-output analysis, Time, Equations.

The purpose of this paper was to discuss model description in terms of mathematical systems theory which subsumes the classes of models represented by the theory of differential equations and by sequential machines. Six items which describe a model according to systems theory were discussed as to their roles in hydrologic modeling. They included: (1) a set of possible inputs such as climatic inputs, model parameters, and physical constants which are required inputs, (2) a time scale, either continuous or discrete, (3) a set of admissible input functions to define the way inputs are organized in time, (4) a set of states determined by examining equations and listing those variables needed to perform all calculations, (5) a state transition function to compute the state of the system at time t given and input function and the initial state which determines (6) the behavior of the system. It was believed that systems theory will provide a unifying theoretical approach to problems of system modeling in hydrology. (See also W71-06576) (Kriss-Cornell)

EXPERIMENTAL PROGRAM FOR ANALYSIS AND VALIDATION OF WATERSHED MODELS,
Arizona Univ., Tucson. Dept. of Hydrology and Water Resources.
Hasan K. Qashu, James J. Rogers, and Chester C. Kisiel.
Research Report, Presented at the National Winter Meeting of AGU, San Francisco, December 7-10, 1970. 10 p, 6 fig. OWRR Project B-007-ARIZ (11).

Descriptors: *Mathematical models, *Computer programming, *Hydrologic data, *Optimization, *Meteorological data, *Watersheds (Basins), Water balance, Rainfall simulators, Data collections.
Identifiers: *Field data.

An experimental program for measuring spatial and temporal variabilities of the elements of water and energy balances was proposed in order to attain the ultimate objective of hydrologic modeling--to predict interactions and outputs of water from the system with known certainty. The discussion was restricted to description of methods used in acquisition of field data. Standard meteorological instruments used included 2 types of rain gages, evaporation pan, net radiometers, heat flow discs, thermistor and diode-type temperature sensors, black and white pyranometers, and psychrometers. Modified sensors and equipment developed included: transducer assemblage, rainfall simulator, and surface delimitors. A data acquisition system capable of varying scanning rates, frequencies of scanning and input signal controls was used to record data on magnetic tape. Rainfall, interception, temperature, radiation, humidity, and changes in soil water storage were monitored with regulated frequencies. The derived mathematical model was developed to allow for simulation of abiotic-biotic interactions in the system. The area was decomposed into subsystems according to soil, vegetative cover, micromorphology, and topographic conditions. The program seemed to provide an effective tool for acquisition of data needed for the development of a physical model. (See also W71-06576) (Kriss-Cornell)

A SIMULATION OF IRRIGATION SYSTEMS--THE EFFECT OF WATER SUPPLY AND OPERATING RULES ON PRODUCTION AND INCOME ON IRRIGATED FARMS,
Economic Research Service, Fort Collins, Colo. Natural Resource Economics Div.
Raymond L. Anderson, and Arthur Maass.
Technical Bulletin No 1431, January 1971. 57 p, 9 fig, 12 tab, 3 append, 28 ref.

Descriptors: *Digital computers, *Systems analysis, *Simulation analysis, *Water resources development, *Water supply, *Irrigation systems, Decision making, Crop production, Income.

The use of a digital computer model of irrigation systems, designed to permit examination of the effects of varying water supply restrictions, water delivery rules, and crop patterns on crop production and farm income in an irrigated area, was described and illustrated. The main objective was to develop and test procedures by which operators and builders of irrigation systems can evaluate and compare alternative methods of distributing water among farmers. The model simulated decision making at several levels of activity in an irrigation system and took into account the responses of different crops to irrigation water. Different decision making activities were assigned to 10 principal phases or subroutines in the general program. Two special subroutines were developed: the first (PLAN) determined the optimum crop pattern in response to a predicted water supply; and the second (REPLAN) reordered farm crop patterns and watering sequences if a water supply became severly short at any time during the season. A third subroutine (TRACE) called for a printout of some of the information used internally in selecting crop watering sequences. Use of the model was illustrated by applying it to a problem involving six farms irrigating six different crops, and receiving different proportions of a total available water supply during 14 intervals in an irrigation season. Results showed the impact on irrigated agriculture of variations in water supply over the season and the importance of the operating procedure used to distribute water. (Kriss-Cornell)

Journal of the Sanitary Engineering Division, ASCE, Vol 97, No SA 2, p 141-159, April 1971. 19 p, 9 fig, 12 ref, 2 append.

Descriptors: *Optimization, *Hydraulic systems, *Network design, *Digital computers, *Mathematical models, *Pipelines, Economics, Costs, Head loss, Pressure head, Water distribution (Applied).
Identifiers: *Equivalent diameters.

An equivalent diameter method for the economical analysis of a pipe network incorporating various cost functions was developed. A relationship between head loss in a pipe and flow through it was given by the Hazen-Williams formula. All branches of network pipes were replaced by equal lengths of equivalent diameter pipes in all loops so that minimum cost was obtained. A correction factor was derived which was algebraically added successively to the assumed flow values resulting in convergence of the assumed flow values towards the solution. A water distribution system consisting of pumps, an overhead service reservoir, and pipe networks was considered for optimization. The effects of the variation of inlet hydraulic head and geometry of the pressure surface on the total cost of the network were studied. The optimal solution was obtained through a digital computer program developed to calculate equivalent diameters and then actual diameters of all pipelines, and total cost of pipelines, the cost of elevated service reservoirs, the initial cost of pumps, and recurring costs using various cost functions. Total cost of a pipe network was dependent on both pressure surface geometry and the inlet pressure head. The cost functions used here were valid for the Calcutta area only but the method could be used in other areas. (Kriss-Cornell)

Bulletin of the International Association of Scientific Hydrology, Vol XV, No 4, p 13-21, December 1971. 9 p, 5 fig, 4 tab, 7 ref.

Descriptors: *Hydrologic aspects, *Salinity, *Stream improvement, *Statistical methods, *Optimization, Streamflow, Watersheds (Basins), Monthly, Precipitation, Agriculture, Rain gages.
Identifiers: Antecedent conditions.

A relationship of hydrologic variables with stream salinity was determined statistically for two ephemeral streams, West Bitter Creek and Beaver Creek watershed, located in western Oklahoma. The hydrologic variables employed, composited on a monthly basis, were measures of average streamflow, precipitation, antecedent conditions, and agricultural land use. The statistical methods employed for evaluating the data included simple correlation, multiple regression, factor analysis, and optimization techniques performed by statistical package programs on an electronic computer. For both watersheds, nearly all variables describing the frequency of occurrence and the amount of precipitation were highly correlated with downstream salinity. Among these, the correlation was best for the relationship of maximum daily P with the salinity of West Bitter Creek Conversely, nearly all variables designating location or characteristics of rain gage zone receiving the maximum P for the month were not significantly correlated with stream salinity. The variables describing antecedent conditions except for salinity, did not correlate well with stream salinity. Data from both watersheds were subjected to factor analysis and those variables closely associated with stream salinity were incorporated into multiple regression equations. In comparing the two streams, West Bitter Creek, having the most intensive rain gage network, produced the best prediction equation. (Kriss-Cornell)

A DIGITAL MODEL FOR SIMULATING SEDIMENT MOVEMENT IN A SHALLOW RESERVOIR,
Corps of Engineers, Davis, Calif. Hydrologic Engineering Center.
William A. Thomas.
In: Proceedings of a Seminar on Sediment Transport in Rivers and Reservoirs, Corps of Engineers Hydrologic Engineering Center, April 7-9, 1970, Davis, California, Paper No 13, 1970. 10 p, 5 ref, 9 plate, append.

Descriptors: *Mathematical models, *Sediment transport, *Reservoir silting, Computer programs, Bed load, Scour, Suspended load, Deposition (Sediments), Sedimentation, Sediment load, Discharge (Water), Stage discharge relations, Backwater, Profiles.
Identifiers: *Ozark Reservoir (Ark).

The Ozark Reservoir is on the Arkansas River near Ozark, Arkansas. It is about 36 miles long and 45 feet deep at Ozark Dam. During periods of low flow this run-of-river reservoir, which supplies hydroelectric power and depth for navigation, will be contained within the river channel. However, the river will overflow the channel during floods. To determine real estate requirements for the reservoir it is necessary to know the volume of future sediment deposits, the location of these deposits, and the effect on water surface profiles in the reservoir. A time-sequence digital model was developed to relate the hydraulic characteristics of flow, the sediment transport capacity and the co servation of material in successive reaches of t reservoir. The order of computations is backwat sediment transport capacity, volume of sediment a reach, and resulting bed elevation. In succeedi reaches the depth of deposits at the upstream end the same as that calculated for the downstream e of the previous reach, and the resulting bed prof is continuous through the reservoir. Identifiers: Water and climate data syste (Alaska).

This report projects needs for water and climate in formation systems in Alaska during the 1970's, an outlines programs that would fill these needs. Th programs concentrate in areas of greatest need--i and near Alaska cities and towns and in the areas o expanding industry and resource extraction. Th programs also seek to establish minimum network type coverage for inventorying and monitoring th water and climate resources. The program

spond to an outlook for broad expansion of the aska economy and for a substantial population crease in the 1970's. They reflect the new de- nds accompanying developments in previously mote parts of the state. They reflect the growing ncern and need for information about the Alaska vironment. Some of the proposals involve sub- ntial program increases. All involve a great deal original work--data collection and studies that ve not been done before. Estimated costs for the oposed programs are summarized. The costs in- de installation, operation and maintenance for oposed new activities, all on the basis of 1970 ces. (Woodard-USGS)

escriptors: *Water resources development, *Sur- ce waters, *Groundwater, *Oklahoma, ydrologic data, Planning, Projects, Evaluation, ater supply, Water yield, Water quality, Water lization, Consumptive use, Hydrogeology, eteorological data, Climatology, Watershed nagement, Streams.
entifiers: *Water resources (Central Oklahoma).

e Oklahoma Water Resources Board, with the sistance of other agencies and individuals, is for- ulating a long-range comprehensive water plan r Oklahoma. This report (Region VIII) the venth in a series called 'Appraisal of the Water d Related Land Resources of Oklahoma,' is part the first step in gathering information basic to s plan for the State's future water prosperity. Re- on VIII contains not only the geographical center the State but also a center of population and in- stry. The Water Resources Council has pre- cted that within the next 20 years the population the stream basin system including Region VII ll increase by about 36% of the 1970 total, and at personal income in this area will increase 2.5 nes over its current rate, primarily as a result of a edicted 36% increase in manufacturing. Extend- g the Arkansas River Navigation Project up Deep rk to Arcadia, as has been projected, would hance the projection for increased industry. In a rmal year of 31-inch precipitation, about 225,000 acre-feet of runoff is generated in Re- on VIII. However, only a small percentage of the nount can actually be developed. Suitable dam es are usually located in areas where water needs e not great. Importing surplus water from outside e basin to meet the growing demand is discussed. Woodard-USGS)

ECONOMIC ASPECTS OF OCEAN ACTIVITIES. VOLUME II. ECONOMIC FACTORS IN THE DEVELOPMENT OF A COASTAL ZONE,
Massachusetts Inst. of Tech., Cambridge.
A. H. Keil.
Available from NTIS as PB-195 224, $3.00 in paper copy, $0.95 in microfiche. Report No MSC-71-67, Cambridge, Mass, Sep 70. 183 p, 123 p with append.

Descriptors: *Coasts, *Nuclear power plants, Beaches, *Urbanization, *Recreation facilities, Planning, Economic feasibility, Cost analysis, Maine government finance.
Identifiers: *Refineries, Urban planning, *Boston harbor.

The core of this Report outlines the economics of the coastal zone in the abstract, defines the concept of economic efficiency, points out the mechanisms by which the private market can fail to allocate the coastal zone efficiently, introduces the concept of parochial benefits, outlines how local control can sometimes operate to produce allocations which are more inefficient than the private market, considers problems introduced by the fact that a decision-making body can almost never predict the future with certainty, and introduces techniques for incorporating this uncertainty into cost-benefit analysis. The practical problems, as well as the limitations, involved in the application of cost-benefit analysis to the coastal zone are explored in some detail in four specific examples: (1) The provision of a recreation facility in Boston Harbor; (2) The redevelopment of the coastal town of Hull, Massachusetts; (3) The location of a nuclear power plant near Plymouth, Massachusetts; and (4) The establishment and location of a refinery complex in Maine and the associated oil distribution problem.

IMPROVEMENT OF HYDRO-ELECTRIC SCHEMES BY HYDROMECHANICAL INVESTIGATIONS AND SCALE MODEL EXPERIMENTS,
Karlsruhe Univ. (West Germany).
E. F. Mosonyi.
Paper DUB/SYMP/EP/B.3, Economic Commission for Europe Committee on Electric Power Symposium on Prospects for Developing Hydro-Electric Schemes and Their Incorporation in Future Energy Supply Systems, Dubrovnik, Yugoslavia, Oct 1970. 13 p, 22 ref.

Descriptors: Project planning, *Hydroelectric power, Hydroelectric powerplants, *Hydroelectric resources, Investigations, Technology, Surge waves, Hydraulic turbines, Pumped storage, Turbine efficiency, Foreign research, Hydraulic machinery, Model studies, Hydraulic design, Research and development, Bibliographies, Operating costs, Cavitation.
Identifiers: German Federal Republic, Hydroelectric power surveys.

Future programs of water power development will utilize less advantageous power sites after the best possible sites have been developed to their fullest extent. Progress in research and technology may open many of the less favorable sites in the future. Some important achievements and trends in technological progress leading to economic development of less favorable hydropower sites are listed. The aspects of improvement by hydromechanical investigations and scale model experiments discussed include: (1) low-head plants, (2) surge control, (3) high-head plants, (4) pumped storage, and (5) improvements in hydraulic machinery. Hydromechanical research may be the major contributor to hydroscheme improvements. Theoretical studies, scale model experiments, and field measurements should be investigated for further improvements in hydropower developments. (USBR)

CENTRAL NEW YORK REGION WATER RESOURCES: DATA INVENTORY AND EVALUATION.
Central New York Regional Planning and Development Board, Syracuse.

Available from NTIS as PB-195 008, $3.00 in paper copy, $0.95 in microfiche. Technical memo, TM-3, Jan 1970. 16 p. HUD Project No NYP-160.
Identifiers: *Regional planning, *New York, *Water resources, Regional planning, Land use, Project planning, Documents.

The report describes the planning efforts, with respect to water resources and related land use of the Central New York Regional Planning and Development Board to January, 1970. Included in the memorandum are a water resources data inventory and an evaluation of the data available. The evaluation section details the organization for water resources planning, the Program for Cooperative Study employed by the River Basin Boards, the progress of this program, and liaison and coordination efforts which are or should be pursued by water resources planners and the Regional Planning Board for their mutual benefit.

WATER SUPPLY AND DEMAND,
Cornell Univ., Ithaca, N.Y.
L. Michael Falkson.
Available from NTIS as PB-198 306, $3.00 in paper copy, $0.95 in microfiche. Technical Report 22, June 1970. 10 p. OWRR Project A-001-NY (11).

Descriptors: *Water supply, *Water demand, *Industrial water, Water shortage, Pricing, Recreation, Statistical methods, *Regions, Water utilization, Water allocation, Irrigation efficiency, Economics.
Identifiers: *Microeconomic analysis, Applied welfare economics.

This is a report concerning some activities and accomplishments at Cornell University through the Water Supply-Demand Project from 1965 to 1969. A brief summary of each year's accomplishments was given. Several new developed courses related to water resources economic were listed. Some of the major research tasks completed by the project were presented. Important research topics in 1966, 67 and 68 included 'The Allocation of Regional Water Supplies: A Case Study of the Northeastern United States,' 'The relationship between water shortages and pricing policies of water supply system,' and some subjects on the demand for water in the fields of irrigation and outdoor recreation. For the fiscal year 1969, the major research activity reported was a statistical analysis of regional variations in industrial water use in the United States to determine if there existed significant regional variations in industrial water use technology as measured by the ratio of water use to value added or water use to value of shipments. A complete description of this analysis made up the bulk of the report. (Wang-Rutgers)

Clarksville-Montgomery County Regional Planning Commission, Tenn.

Available from NTIS as PB-195 414, $3.00 in paper copy, $0.95 in microfiche. Report to the Clarksville-Montgomery County Regional Planning Commission, Tenn, May 1970. 109 p. HUD Project Tenn P-60.

Descriptors: *Regional analysis, *Water supply, *Sewers, Financing, Land use, Population, Economic feasibility.
Identifiers: *Regional planning, Regional planning, *Montgomery County, Tennessee, *Clarksville, Tennessee.

The study includes an immediate (5-10 year) and long-range (20-year) water and sewer plan. The area covered is the entire County for water and a 100 square mile urbanizing area, excluding Fort Campbell, for sanitary sewers. Proposals are made for solving immediate problems while indicating needs for the next 20 years.

FUTURE DEMANDS ON GROUNDWATER IN NORTHEASTERN ILLINOIS,
Illinois State Water Survey, Urbana.
Richard J. Schicht, and Allen F. Moench.
Groundwater, Vol 9, No 2, p 21-28, March-April 1971. 8 p, 7 fig, 3 tab, 11 ref.

Descriptors: *Water demand, *Water resources development, *Groundwater, *Illinois, Water balance, Urbanization, Cities, Withdrawal, Water utilization, Water yield, Recharge, Water sources, Lake Michigan.
Identifiers: *Urban water supply, *Chicago (Illinois).

Future water demands were estimated for each 10-year interval from 1980 to 2020 for areas in the Chicago region dependent upon groundwater as a source of supply. Demands were compared with groundwater availability to define water deficient areas. Two approaches were considered in developing the groundwater resource. The first approach limits groundwater withdrawals to the maximum rate of natural groundwater recharge that can be induced by pumping. The second approach allows withdrawals to exceed natural recharge. When limiting groundwater withdrawals to recharge a large part of the region will require importation of water by as early as 1980. With proper pumpage distribution it is conceivable that there is sufficient water that can be withdrawn (mined) in excess of natural recharge to meet demands through the year 2020. (Knapp-USGS)

GUILFORD AND SANGERVILLE WATER DIST V SANGERVILLE WATER SUPPLY CO (POWER OF PUBLIC UTILITIES TO SELL THEIR PROPERTY).

154 A 567-569 (Me 1931).

Descriptors: *Maine, *Contracts, *Remedies, *Public utilities, Public utility districts, Water supply, Water rights, Land tenure, Public rights, Legislation, Judicial decisions, Legal aspects, Administrative agencies, Watercourses (Legal), Reservoirs, Pipes, Conduits, Costs, Eminent domain.

Plaintiff water district sought specific performance of contracts by which defendant water utility companies agreed to sell their works to plaintiff. In one contract the utility's predecessor promised the town or water district, if one was created, that one or the other might acquire the waterworks anytime after installation. In the second contract the legislative charter for the water company provided that the town or water district, if one was created, might purchase ten years after construction. The Supreme Judicial Court of Maine dismissed both bills. In the first contract, the water company had succeeded to the duties under the contract. However, such corporations are quasi-public and may not, without legislative consent, deal with its property in such a way as to incapacitate itself from performing its public duties. The proposal to sell the water system went beyond defendant's corporate power. As to the second contract the legislature, exercising its right to revoke its authorization of sale, amended its original act, enlarging the water district and repealing the provision respecting sale and purchase under the contract offer. (Duss-Florida)

REUTER V MILAN WATER CO (RIGHT OF WATER COMPANY TO CONDEMN LAND FOR WATER SUPPLY PURPOSES).
198 NE 442-444 (Ind 1935).

Descriptors: *Indiana, *Eminent domain, *Condemnation, *Water supply, Wells, Construction, Lakes, Streams, Subsurface waters, Reservoirs, Cities, Domestic water, Land, Legislation, Judicial decisions, Legal aspects, Right-of-way, Administrative agencies, Public utilities.

Plaintiff water company sought to condemn defendants' lands for the purpose of providing a town's water supply. The projected water supply was to be pumped from beneath defendants' lands. Defendants objected on several grounds, including: (1) that there was no statutory authority giving a private corporation the right of eminent domain; (2) that condemnation of land for the procurement of water where the source was a surface body of water could be distinguished from condemnation of land where the source was underground, and (3) that there was no basis for determining the amount of water to be taken. The trial court overruled defendants' objections and the Supreme Court of Indiana affirmed. A specific legislative act empowers corporations organized and authorized to furnish water to the public or towns to condemn land to carry out such purpose. There is no distinction

between condemning land with surface water sources and that with subsurface water sources. Determination of the amount of water taken and its value is an issue of fact to be determined upon the report of the appraisers. (Duss-Florida)
W71-06531

ANCONA REALTY CO V FRAZIER (OWNERSHIP OF ACCRETED ISLAND).
41 SW2d 820-824 (Mo 1931).

Descriptors: *Missouri, *Accretion (Legal aspects), *Legislation, *Land tenure, Real property, Boundaries (Property), Boundary disputes, Islands, State governments, Riparian land, Rivers, Missouri River, Legal aspects, Judicial decisions, Prescriptive rights.

Plaintiff realty company brought action to quiet title to island land claimed by defendant landowner. Defendant asserted that he held title to the disputed land by accretion to his riparian tract, which was also accreted land. By statute, title to all accreted land had been vested in the county; the statute also provided a 20-year moratorium for adverse possession against the county on these accretions. The disputed accretion had occurred during the moratorium. Since plaintiff's tract had been owned by the county at the time of the accretion by virtue of the statute, the Supreme Court of Missouri held that defendant could not have acquired title by accretion. Defendant further asserted title by patent from the county; however, the description of his land did not include the disputed land. The court held that since alluvion or batture with sufficient elevation to be privately owned did not pass with other land unless expressly conveyed in the patent, defendant did not have title by patent. Accordingly, the lower court decision for plaintiff was affirmed. (Hart-Florida)
W71-06554

VAUGHAN V VIRGINIA ELECTRIC AND POWER COMPANY (AUTHORITY TO ISSUE DAM PERMITS FOR NON-HYDROELECTRIC PURPOSES).
178 SE2d 682-684 (Va 1971).

Descriptors: *Virginia, *Dams, *Electric power production, *Watercourses (Legal), Legal aspects, Judicial decisions, Hydroelectric project licensing, Hydroelectric power, Nuclear power plants, Nuclear reactors, Nuclear energy, Cooling water, Cooling, Electric power industry, Electrical networks, Transmission lines, Damsites, Ponding, Rivers, River flow, Land tenure, Real property, Permits, Legislation, Interstate.

Intervening landowners sought to contest the state's grant of a license to dam a river to create a cooling reservoir for a nuclear powerplant. The impounded waters were to be used for cooling purposes only. The intervening landowners contended that the State Corporation Commission was not authorized to issue dam construction permits for non-hydroelectric purposes. The Virginia Supreme Court of Appeals held that the State Corporation Commission was authorized to issue damming permits where the power to be generated by a nuclear plant would flow through interstate transmission lines. Under statutes there were two classes of water: (1) 'water within the state', for which only hydroelectric dam permits could be issued; and (2) 'waters of the state', which included waters the damming of which would affect interstate or foreign commerce. The licensing of any dam was authorized for 'waters of the state'. Noting that the nuclear plant would transmit power over interstate lines, the court affirmed the Commission's order issuing the license and conceding a lack of jurisdiction over related property interests. (Earl-Florida)
W71-06568

MOARATTY V TOWN OF HAMPTON (MUNICIPAL LIABILITY FOR STORM DRAIN OVERFLOW).
272 A2d 606-608 (NH 1970).

Descriptors: *New Hampshire, *Local governments, *Flood damage, *Drainage systems, Floods, Floodwater, Legal aspects, Damages, Land tenure, Drains, Drainage effects, Drainage water, Surface waters, Compensation, Judicial decisions, Cities, Storms, Precipitation (Atmospheric), Storm runoff, Cloudbursts, Storm drains, Surface runoff, Intakes, Adjudication procedure.

Plaintiff landowner brought action for property damage resulting from flooding when defendant town's drainage system overflowed. Heavy precipitation preceded the flooding. Plaintiff claimed defendant was negligent in maintaining the system. Defendant asserted that the precipitation was an act of God which overtaxed the system. Defendant contested a jury verdict in favor of plaintiff and the trial court's denial of his motions for nonsuit and directed verdict. The Supreme Court of New Hampshire held that a property owner is not entitled to recover for flood damage resulting from drainage system overflow unless the town's negligence in performing maintenance, or the existence of obstructions within the system, is first established. The court ruled that defendant's negligence could not be inferred from the mere fact of injury to plaintiff's property. Finding no evidence of either an obstruction within the system or negligence, the court held defendant's motions should have been granted. (Earl-Florida)
W71-06584

ARNOLD'S INN, INC V MORGAN (REQUIRED REMOVAL OF OBSTACLES TO RIPARIAN ACCESS).
317 NYS2d 989-991 (Sup Ct 1970).

Descriptors: *New York, *Riparian rights, *Damages, *Access routes, Riparian land, Relative rights, Riparian waters, Navigable waters, State jurisdiction, Real property, Land tenure, Legal aspects, Judicial decisions, Adjudication procedure, Local governments, Right-of-way, Water rights.

Plaintiff riparian owner brought action to compel the removal of rubble and other objects placed on his shoreline by defendant neighboring property owner. Plaintiff contended that such objects restricted his right of access to a navigable tidal bay. Plaintiff failed to establish any damages. Defendant alleged slander of title. Cross claiming township sought an injunction barring defendant's trespass and requiring him to remove certain structures. Plaintiff and defendant appealed lower court's judgment granting township's cross claim but dismissing plaintiff's claim and defendant's counterclaim. The New York Supreme Court held that a riparian owner is entitled to the removal of obstacles restricting his right of direct access to riparian waters notwithstanding the fact that such riparian owner fails to establish resulting damages. Judgment was affirmed insofar as it related to the township's right to injunctive relief. Judgment was modified in respect to plaintiff's claim, and defendant was directed to remove the objects complained of which restricted his direct access to riparian waters. (Earl-Florida)
W71-06589

ROBICHAUX V THERIOT (PROOF OF NAVIGABILITY AS A PREREQUISITE FOR APPLYING ADMIRALTY LAW).
242 So2d 644-646 (La Ct App 1970).

Descriptors: *Louisiana, *Navigation, *Admiralty, *Boating, Boats, Canals, Damages, Recreation, Risks, Adjudication procedure, Navigable waters, Non-navigable waters, Bodies of water, Accidents, Insurance, Legal aspects, Judicial decisions.

Plaintiff boat passenger sought compensation from defendant boat operators and their insurers for injuries sustained in the collision of two pleasure boats. The collision occurred at dusk in the narrow channel of a fifty foot wide canal. No evidence of the canal's navigability was introduced at trial. Plaintiff claimed that the negligent operation of both boats caused his injuries. The trial court rendered judgment against both defendants. Averring that the canal was navigable, one insurer appealed, contending that the divided damages rule of admiralty prohibited solidary liability judgments. Appellant also contended that the award of $10,000 damages was excessive. The Louisiana Court of Appeals held that, absent prior proof of navigability, a canal cannot be presumed navigable for purposes of applying the divided damages rule of admiralty law. Finding both operators jointly and contributorily negligent, the court affirmed the lower court's solidary judgment against defendants. In light of plaintiff's injuries the award was ruled not excessive. (Earl-Florida)
W71-06591

YEOMAN V KANSAS CITY (MUNICIPALITY'S LIABILITY FOR INSTALLATION OF CULVERT AND ALTERING FLOW OF STREAM).
18 SW2d 107-111 (Kansas City Ct App 1929).

Descriptors: *Missouri, *Cities, *Floods, *Overflow, Streams, Culverts, Storm runoff, Storm drains, Surface waters, Surface runoff, Roads, Natural flow doctrine, Alteration of flow, Streamflow, Riparian rights, Surface drainage, Legal aspects, Judicial decisions.

Plaintiff riparian landowner sued defendant municipality for damages resulting from overflow of the creek in front of plaintiff's property. Plaintiff asserted that defendant had negligently installed a culvert and altered the flow of the creek. Before the culvert was installed the creek had never overflowed onto plaintiff's land. Defendant answered that the damage was the result of extraordinary rainfall. At trial, verdict was given for defendant. Plaintiff moved for a new trial, alleging that the verdict was against the weight of the evidence. Although the Kansas City Court of Appeals determined that the evidence failed to show that the culvert ipso facto caused the overflow, it found that the evidence demonstrated that defendant's raising of a street downstream had caused the overflow. In granting plaintiff's motion for a new trial, the court stated that it was no defense for defendant to answer that its actions were a governmental function, performed in good faith. (Hart-Florida)
W71-06592

HOGGE V DRAINAGE DIST NO 7 (DRAINAGE DISTRICT'S LIABILITY FOR FLOODING LAND OUTSIDE DISTRICT).
26 SW2d 887-891 (Ark 1930).

Descriptors: *Arkansas, *Drainage districts, *Flooding, *Remedies, Flood damage, Submergence, Overflow, Design flood, Maximum probable flood, Administrative agencies, Eminent domain, Condemnation, Damages, Compensation, Real property, Crops, Drainage, Reservoir, Remedies.

Plaintiff landowner sued defendant drainage district for damages caused by overflow of plaintiff's land. Defendant's construction of a reservoir caused water to overflow plaintiff's land, which was located outside the drainage district. Defendant contended that since plaintiff's property was located outside the district, defendant was not liable. However, the Supreme Court of Arkansas stated five propositions in holding that the lower court improperly sustained defendant's demurrer: (1) obstructing a stream, causing overflow, is a compensable injury; (2) the natural flow of water cannot be changed for the benefit of one class and to the detriment of another without compensation; (3) if a drainage district takes land, compensation must be effected before appropriation; (4) if a district concedes that damage will result from improvements, damages may be assessed by eminent domain proceedings or an action for trespass; and (5) if damages are not conceded, an action for damages may be brought when the improvement is constructed. It makes no difference that damaged property is outside the drainage district whose actions resulted in the injury. Since the demurrer ad-

mitted plaintiff's allegations, and the injury was permanent, defendant was held liable. (Hart-Florida)
W71-06593

REID V ROSS (RIPARIAN OWNER SUBJECT TO FISH AND GAME REGULATIONS).
46 SW2d 567-569 (Mo 1932).

Descriptors: *Missouri, *Fishing, *Lakes, *Legislation, State governments, *Missouri River, Navigable rivers, River beds, Riparian land, Riparian rights, Legal aspects, Judicial decisions.

Plaintiff riparian owner sought to enjoin defendant fish and game commissioner from interfering with her fishing rights. A lake had been formed in the river bed when the Missouri River changed its course; part of this lake was owned by plaintiff. Plaintiff seined the lake commercially, and defendant arrested her agents for violation of fish and game law. The applicable statute proclaimed that fishing in 'any of the waters of this state' was unlawful except as permitted by law. However, these restrictions were not applicable to private ponds and artificially propagated fish held in captivity. It was determined that plaintiff's circumstances were not within either of these exceptions. The Supreme Court of Missouri noted that the lake formed in the river bed was private with respect to the riparian fishing right, but that this right was subject to state regulation. Hence, the statute was held to prohibit commercial seining in the lake, and the injunction was denied. (Hart-Florida)
W71-06594

WATER AND RELATED LAND RESOURCES - STATE ADMINISTRATION, LEGISLATIVE PROCESS AND POLICIES IN MINNESOTA, 1970,
Minnesota Univ., Minneapolis.
William C. Walton, and David L. Hills.
Available from NTIS as PB-198 307, $3.00 in paper copy, $0.95 in microfiche. Bulletin No 27, Jan 1971. 344 p, 19 fig, 18 tab. OWRR Project A-021-MINN (1).

Descriptors: *Minnesota, *Water resources, *Water policy, *Administration, Administrative agencies, Legislation, Water conservation, Water pollution, Water pollution control, Planning, Coordination, Land resources, Natural resources, Conservation, Environment, Public health, Water rights, Public rights, Federal government, Government finance, Legal aspects, Water resources development, History, Financing.

The first of a three-part report on water resources administration in Minnesota, this bulletin contains information on state water and related land resources administration, legislative progress, and policies as of 1970. The bulletin initially summarizes the state administrative structure and gives detailed data on the operation of such state agencies as the Department of Conservation, the Pollution Control Agency, the Soil and Water Conservation Commission, the Water Resources Board, the State Board of Health, and the State Planning Agency. It recommends reorganization of state regulatory agencies to better coordinate various agency activities. Included is a reorganization plan consisting of a consolidation of major administrative functions within a single agency, creation of an environmental council and environmental quality commission, and a broadening of the duties of the Minnesota Resources Commission. The bulletin reviews measures relating to water resources introduced in the legislature during the 1969 session. Here it discusses the Minnesota Resources Commission, which serves as a research facility for the legislature. The bulletin ends with a discussion of state water policies and the need for a comprehensive state environmental policy. The National Environmental Policy Act of 1970 is included, as is a list of proposed state legislative actions. (Duss-Florida)

PUBLIC LAND POLICY AND THE ENVIRONMENT, VOLUME 3, PART II: ENVIRONMENTAL PROBLEMS ON THE PUBLIC LANDS. CASE STUDIES 9 THROUGH 17,
Rocky Mountain Center on Environment, Denver, Colo.
Rudolf W. Becking, and G. Lloyd Hayes.
Available from NTIS, AS PB-196 170, $3.00 in hard copy, $0.95 in microfiche. Rocky Mountain Center on Environment, Denver, Colorado, December 1970. 837 p, 18 fig, 16 illus, 125 photos, 19 tab, 413 ref, 21 append.

Descriptors: *Public lands, *Land use, *Environmental effects, *Land management, National parks, Pollution abatement, National recreation areas, Water management (Applied), Natural resources, Federal government, Legislation, Fisheries, Insect control, Wildlife habitats, Diseases, Water quality, Lumber, River basins, Oil, Dams, Recreation demand, Recreation, Highway effects, Transmission lines, Legal aspects.

Nine case studies are included in this volume, each of which discusses public land uses or management practices having environmental consequences. The case studies which include data collected and outside materials, discuss: (1) timber, fisheries, and water quality problems in a river basin in Oregon; (2) a review and analysis of four insect-disease control projects; (3) the Santa Barbara oil spill, including the history of oil legislation, judicial decisions, a recounting of events leading to the spill, the spill's environmental impact, the role of the federal government, and suggestions for future legal approaches; (4) the environmental impact of an interstate highway on a wildlife refuge in Alabama; (5) the impact of proposed dams on the Snake River in Idaho; (6) the impact of recreational use on the environment in Minnesota's canoe wilderness of the National Wilderness Preservation System and an appendix of the legal materials involved; (7) the impact of recreational use on the environment in Yosemite National Park; (8) off-road vehicular traffic as a threat to the environment; and (9) aesthetic coordination of transmission lines with the environment. The volume is replete with figures and illustrations and contains 21 appendices documenting the case-study material. (Smiljanich-Florida)
W71-06601

THE HUDSON RIVER BASIN.
League of women Voters Education Fund, Washington, DC, $0.50, 1969. 40 p.

Descriptors: *Hudson River, *River basin development, *Water pollution, *Interstate compacts, River basins, Navigable rivers, River basin commissions, Watersheds (Basins), Interstate commissions, Watershed management, Legal aspects, Delaware River Basin Commission, Pollution abatement, Water pollution control, Water pollution treatment, Water management (Applied).

Land and water use in the Hudson River Basin is the subject of this report. Part I of six parts discusses the 'Challenge on the Hudson', stressing the difficulty of mobilizing an effort to prevent man from destroying nature. In part II, entitled 'Facts and Trends', the upper and lower Hudson basins are examined separately. Part III examines demands on the water and land in six reports dealing with: (1) agriculture; (2) industry; (3) housing; (4) highways; (5) conservation; and (6) water storage. 'Are the Challenges Being Met' is the title of part IV; it examines: (1) the pure waters program; (2) water supply planning; (3) administrative systems for planning and implementation of water policy, including the Delaware River Basin Example and the 'Interstate-Federal Compact for the Hudson'; and (4) the Hudson River Valley Commission. Part V is entitled 'Basin Miniatures' and discusses the Herkimer-Oneida Counties Comprehensive Planning Program in New York. The final part relates methods of obtaining support for a pollution control project from the local government. (Hart-Florida)

LAW OF WATER RESOURCES OF THE STATE OF MISSISSIPPI: A MULTIFACTORAL, POLICY-ORIENTED STUDY OF LEGAL PRESCRIPTIONS RELATING TO WATER USE AND CONTROL,
Mississippi Water Resources Research Inst., Oxford.
P. Williams, and W. Holder.
Technical Report, Project No 6, June 30, 1966. 23 p, 80 ref.

Descriptors: *Mississippi, *Water resources, *Federal-state water rights conflicts, Water control, Water law, Watercourses (Legal), Artificial watercourses, Natural, Streams, State governments, Mississippi River, Boundaries (Property), Boundary disputes, Water resources development, Legal aspects, United States, Federal government, Regulation, Legislation, Judicial decisions, Water policy.

The objectives of this study were: to determine the problems created by conflicting claims to water use and control in Mississippi; to explore how these conflicting interests have been protected by legislative act, judicial decision, and administrative regulations; and to formulate recommendations for legislation. The research was conducted in three phases, the first phase analyzing legal problems relating to the Mississippi Sound. The Sound was considered important because of conflicting claims of three states and the United States to control its water resources. Delineation of the Mississippi state boundary was necessary to resolve the conflicts. Recommendations to resolve the boundary conflicts and to clarify the authority of the claimants to control the Sound were promulgated. The second phase of the study involved a comprehensive analysis of the law of natural watercourses within Mississippi and included an examination of the legal rights of riparian owners, the status of natural watercourses as boundaries, and problems arising from obstruction of natural watercourses. The final phase examined the law of artificial watercourses, including the right to create and use artificial watercourses, and remedies available to aggrieved parties. (Hart-Florida)

PROTECTION AND ENHANCEMENT OF ENVIRONMENTAL QUALITY.
Federal Register, Vol 35, No 46, Saturday, March 7, 1970, p 4247-4248.

Descriptors: *Federal government, *Federal project policy, *Administrative agencies, *Balance of nature, Environment, Institutions, Institutional constraints, Adoption of practices, Coordination, Decision making, Leadership, Legislation, Multiple-purpose projects, Project planning, Administration, Administrative decisions, Non-structural alternatives, Integrated control measures, Environmental effects, Ecology.
Identifiers: *National Environmental Policy Act of 1969.

Measures to be taken by federal agencies and the Council on Environmental Quality in furtherance of the National Environmental Policy Act of 1969 are stipulated in this Order. Heads of agencies shall: (1) moniter and evaluate agency activities to protect environmental quality; (2) insure the adequacy of public information on programs having environmental impact; (3) insure that other governmental bodies and other interested institutions have access to information on environmental problems and control measures; and (4) identify inconsistencies between the National Environmental Protection Act of 1969 and agency jurisdiction, authority, or procedures. The Council on Environmental Quality shall: (1) evaluate and make recom-

mendations concerning federal policies and programs affecting environmental quality, (2) recommend priorities in environmental programs, (3) conduct hearings and conferences on significant environmental issues, (4) promote the development and use of environmental indexes and monitoring systems, (5) coordinate federal environmental programs, (6) foster research relating to environmental quality, and (7) advise and assist the President and federal agencies on international environmental efforts and in preparing the annual Environmental Quality Report. (Earl-Florida)

OUTDOOR RECREATION UNDER FEDERAL POWER ACT.

Federal Register, Vol 35, No 42, p 3993-3994, March 1970. 2 p.

Descriptors: *Administrative agencies, *Recreation, *Regulations, *Federal Power Act, Administrative decisions, Federal government, Federal project policy, Electric power industry, Electric powerplants, Facilities, Recreation facilities, Boating, Swimming, Water sports, Multiple-purpose projects, Safety, Recreation wastes.

The Federal Power Commission clarifies herein a statement of policy respecting outdoor recreational developments at projects licensed or to be licensed under the Federal Power Act. The previous statement of policy is amended to specify that the recreation facilities referred to are those maintained and operated by the licensee, and that the licensee is not expected to be an insurer or guarantor of the safety of visitors, but rather that reasonable measures and facilities be provided to enhance safe use and enjoyment of project lands and waters for recreational purposes. Measures required by the regulation include adequate vertical clearance under bridges and transmission lines, log-booms at spillways and powerhouses, warning systems, buoys, signals, signs, fencing, and sewage facilities. W71-06605

MORE ABOUT OYSTERS THAN YOU WANTED TO KNOW,
Garrett Power.
Maryland Law Review, Vol 30, No 3, p 199-225, Summer 1970. 27 p, 154 ref.

Descriptors: *Maryland, *Oysters, *Commercial shellfish, *Regulation, Shellfish, Commercial fishing, Fish harvest, State governments, State jurisdiction, Political constraints, Legal aspects, Administration, Political aspects, Conservation, Fish conservation, Bays, Fish populations, Fish management, Economic efficiency, Aquatic productivity, Public rights, Non-structural alternatives, Legislation, Judicial decisions, Relative rights.
Identifiers: *Constitutionality.

This article considers: (1) the nature of economic problems occasioned by treating oysters as common property, (2) the response of Maryland's legal institutions, and (3) suggested alternatives to the present treatment. In the author's view, Maryland's attempts to regulate, subsidize, and restore excessively exploited public-oyster grounds have not attained the desired result. Entry restrictions on nonresidents and corporations, and depletion controls governing equipment, minimum oyster size, and seasons appropriate for taking oysters are depicted as discriminatory, economically unproductive, and expensive to enforce. The author suggests and traces past attempts at granting exclusive-use rights to oyster grounds. Recognizing political pressure against the revision of existing laws, the author recommends a broad constitutional attack on the Maryland Oyster Code. Legal precedent attacks on the Code under the equal protection and commerce clauses are presented. After a successful judicial nullification of existing laws, the author suggests a legislative delegation of broad management authority to the Fish and Wildlife Administration. Such a grant of authority would allow the Administration to: (1) determine the most desirable mix between public and private ownership, (2) implement the most technologically efficient oystering methods, and (3) flexibly respond to altered conditions. (Earl-Florida)

THE 1958 GENEVA CONVENTION ON THE CONTINENTAL SHELF,
J. A. C. Gutteridge.
In: The British Year Book of International Law 1959, Oxford University Press, Oxford, England, p 102-123, 1960. 75 ref.

Descriptors: *Continental shelf, *International law, *Law of the sea, *Treaties, Aquatic life, International waters, International joint commissions, International commissions, Foreign waters, International Bound and Water Comm., Continental slope, Continental margin, Legal aspects, Commercial fishing, Commercial fish, Commercial shellfish, Natural resources.

Centering on the 1958 Geneva Convention on the Continental Shelf, this article presents an historical analysis of international law concerning continental shelves. Various proposals of signatories to the 1958 Convention are discussed and evaluated. The following subjects are discussed in this article: (1) definition of the continental shelf, (2) nature and extent of the coastal state's rights in the continental shelf, (3) delimitation of the boundary of the continental shelf appurtenant to adjacent states, (4) continental shelf installations, (5) tunneling from terra firma, and (6) the purposes for which a coastal state may exercise sovereign rights over the continental shelf. A coastal state's rights extend to the limit of the territorial sea and beyond to a depth of 200 meters. Coastal states possess sovereign rights to exploit the natural resources of their continental shelf, including sedentary but not swimming species of aquatic life. Installations may be constructed on the continental shelf, and the median line principle is to be used to determine the breadth of the territorial sea. The author concludes that the Convention made a significant contribution to international law even though the breadth of the territorial sea and fishery limits were left unresolved. (Robinson-Florida)
W71-06607

WATER RESOURCES--THE INTEREST AND RIGHTS THEREIN OF THE CITIZEN-BENEFICIARY: A DISCUSSION OF NEW YORK LAW,
G. David Van Epps.
Syracuse Law Review, Vol 21, No 4, p 1173-1192, Summer 1970. 100 ref.

Descriptors: *New York, *Water rights, *Riparian rights, *Public rights, Water resources, Legislation, Riparian waters, Riparian land, Preferences (Water rights), Water pollution, Water pollution control, Pollution abatement, State governments, Eutrophication, Ecology, Environment, Local government, Legal aspects.

The theory that the ultimate impact of the deterioration of water resources is on the quality of life and belongs to the citizenry at large is postulated by this comment. It is suggested that the citizen-beneficiary's interest in water resources should no longer lurk in the background, but be legally recognized and protected. After reviewing various forms of pollution, including eutrophication and some pollution caused by human uses of water, expressions of the citizen-beneficiary's rights are considered. The citizen's riparian, common law, and statutory rights are treated among these rights. While reviewing riparian rights, the author notes that running water is not subject to ownership and that prior appropriation does not apply thereto. The origin of the riparian right from a largely agricultural society is traced. Common law rights, such as the citizen's right to use navigable waters are next reviewed. New York statutory rights of citizens in water resources are considered in detail. The author observes that in recent years the state has been more actively seeking to preserve the citizen interest in waters. He concludes that the citizen-beneficiary's 'patchwork' of water rights is inordinately inflexible to changing society and that more definitive recognition must be afforded the rights of the citizen. (Hart-Florida)
W71-06608

BOUNDARIES ON WATERS,
J. C. Adkins, Jr.
In: Florida Real Estate Law and Procedure, The Harrison Company, Atlanta, Georgia, p 37-48, 1959. 12 p, 35 ref.

Descriptors: *Florida, *Boundaries (Property), *Navigable waters, *Non-navigable waters, Navigation, Ownership of beds, Navigable rivers, Streams, Rivers, Lakes, Boundary disputes, Shores, Tidal waters, High water mark, Low water mark, Tides, Meanders, Riparian rights, Riparian land, Legal aspects, Water law, Land, Land tenure.

Five definitions are used in this article in considering boundaries on waters: (1) the shore is the space between high and low water marks on navigable rivers; (2) uplands are lands bordering on bodies of water; (3) the thread of a stream is the line midway between the opposite shore lines, when the water is at its normal level; (4) tide lands are lands covered and uncovered daily by water through the ebb and flow of normal tides; and (5) seacoast is land adjacent to the sea or ocean. In addition to these definitions, the article covers: (1) history of the law determining water boundaries; (2) navigability of waters; (3) non-navigable waters; (4) navigable waters; (5) artificial waters; (6) meandering waters; and (7) particular calls. The article observes that Florida waters are not considered navigable merely because affected by tides, but must be navigable in fact. It is stated that unless a contrary intention appears, a conveyance of land bounded by water is construed to pass the soil towards the center of the water as far as the grantor owns. Hence, conveyances of land on non-navigable waters pass title to the thread of the stream. Absent a contrary intention, grants of lands bordering on navigable waters carry title to ordinary high water mark. (Hart-Florida)

LEGAL BASES FOR REGIONAL ACTION.
In: River Basin Administration and the Delaware, Syracuse University Press, Syracuse, New York, p 128-148, 1960. 21 p, 43 ref.

Descriptors: *Water resources development, *Interstate compacts, *River basin commissions, *Governments, Legal aspects, Local governments, Federal government, State governments, Interstate commissions, Interstate, Interstate rivers, Delaware River Basin Commission, Legislation, Political aspects, Water management (Applied), Administrative agencies, Administration, Non-structural alternatives.

The legal foundations for planning and managing the water resources of interstate waters are considered in this chapter. One possible source of policy described is an executive committee such as the Delaware River Basin Advisory Committee composed of several governors and mayors; however, the limitations of an executive order are noted. An order: (1) can comprehend interstate areas only at the federal level; (2) is temporary; and (3) is fiscally inadequate. State legislation is the next foundation considered. The author points out that by parallel legislation in adjoining states., interstate management of water resources is feasible. Interstate compacts are also considered as a legal foundation for water resources management. The advantages of the interstate compact are: (1) adequate geographic reach and (2) durability. However, delay in ratification by legislatures is considered a major disadvantage. 'Recent Water Compacts' and 'Federal Work with Compact Agen-

cies' are subtopics examined. The author finds that a federal statute is a prime foundation, since its advantages are: (1) adequate geographic coverage, (2) permanence, and (3) adaptability. The special problem of water allocation is considered in three areas: (1) court decree, (2) federal law and interstate compact, and (3) allocation by administrative agencies. (Hart-Florida)
W71-06610

WATER RIGHTS,
J. C. Adkins, Jr.
In: Rights Incident to Possession of Land, Little, Brown and Company, Boston, p 156-202, 1954. 47 p, 249 ref.

Descriptors: *Water rights, *Streams, *Surface waters, *Groundwater, Appropriation, Natural flow doctrine, Preferences (Water rights), Prescriptive rights, Prior appropriation, Riparian rights, Lakes, Competing uses, Land tenure, Real property, Legal aspects, Reasonable use, Artificial use, Domestic water, Natural use, Relative rights, Riparian land, Drainage, Judicial decisions.

Three main topics are discussed in this chapter dealing with water rights: (1) streams and lakes; (2) surface waters; and (3) diffused groundwaters. In examining streams and lakes, the following areas are considered: (1) riparian rights; (2) the quantitative extent of water rights--natural flow versus reasonable use; (3) the qualitative extent of water rights--domestic versus reasonable commercial uses; (4) the origins, scope and characteristics of appropriation rights; (5) subordination of private rights to public uses; and (6) servitudes for natural stream and flood channels upon riparian lands. Topics discussed with respect to surface waters are: (1) kinds and characteristics of such waters; (2) proprietary rights; (3) rights to obstruct and deflect natural flow; and (4) artificial drainage rights. In relation to diffused surface waters, the following topics are discussed: (1) characteristics of percolating, artesian, and other nontributary groundwaters; (2) proprietary rights; (3) appropriation rights; and (4) interferences with natural flow and purity. (Hart-Florida)
W71-06611

CASTING GARBAGE, ETC, INTO WATERS (CRIMINAL PENALTIES).
Va Code Ann sec 62.1-194 (Supp 1970), amending sec 62.1-194 (1968).

Descriptors: *Virginia, *Waste disposal, *Water pollution control, *Environmental sanitation, Baits, Pollutants, Recreation wastes, Crabs, Fish attractants, Water pollution sources, Water resources, Pollution abatement, Non-structural alternatives, Water policy, Regulation, Institutional constraints, Flotsam, Jetsam, Legislation, State governments, Legal aspects, Wastes.

The act of casting, throwing, or dumping solid waste, except fish or crab bait, into state waters is prohibited in this amendment to existing legislation. Such acts are classified as misdemeanors and are punishable by a fine not exceeding one hundred dollars, a jail term not in excess of thirty days, or both. Enforcement authority is vested in all law enforcement officers of the state and its subdivisions. (Earl-Florida)
W71-06612

SANITARY DISTRICTS (CREATION, AUTHORITY, AND POWERS).
Va Code Ann secs 21-113, 21-118.4, 21-121 (Supp 1970) amending secs 21-113, 21-118.4, 21-121 (1968).

Descriptors: *Virginia, *Multi-purpose projects, *Sewage districts, *State governments, Local governments, Administration, Administrative agencies, Recreation facilities, Garbage dumps, Jurisdiction, Sewerage, Sewage treatment, Eminent domain, Condemnation, Water districts, Legal aspects, Regulation, Drainage systems, Water supply, Water resources development, Legislation, Sanitary engineering, Waste disposal, Environmental sanitation.

The creation and general powers of sanitary districts in Virginia are set forth in this legislation amending an existing statute. The creation of sanitary districts and enlargement of existing districts is authorized by order of a circuit court upon proper application of the voters within a county. The governing boards of such districts are authorized to institute condemnation proceedings for the purpose of constructing water and sewage facilities. Additional powers vested in the governing board by this enactment include the power to: (1) construct, maintain, and operate parking lots, water supply, drainage, sewerage, garbage disposal, heat, light, power, gas, sidewalk, streets, and fire-fighting systems; (2) construct and operate recreational facilities; (3) contract with private or public entities; (4) require owners or tenants of property to connect with systems operated by the district; (5) prescribe and collect charges for the use of sanitary district systems and assert liens where such charges are not paid; (6) employ and compensate necessary personnel; and (7) negotiate for connection of district systems with existing systems and extensions in areas outside of the district. (Earl-Florida)
W71-06613

PUBLIC UTILITIES--ANTI-POLLUTION REQUIREMENTS.
Session Law Service ch 273, p 700, New Jersey, 1970.

Descriptors: *New Jersey, *Public utilities, *Pollution abatement, *Water pollution control, Legislation, Air pollution, Soil contamination, Regulation, Administration, Legal aspects, Utilities, Water works, Electric power industry, Water quality control, Water pollution sources, Power system operations, Public rights, Pollutants, Adoption of Practices, State governments, Standards, Non-structural alternatives.

The rule-making authority of the Board of Public Utility Commissioners is broadened by this amendment allowing the Board to require public utilities to furnish and perform their services in a manner that tends to conserve and preserve the quality of the environment and prevent the pollution of water, air, and land of the state.
W71-06614

WETLANDS ACT OF 1970.
NJ Session Law Service ch 272, p 697-699, 1970.

Descriptors: *New Jersey, *Wetlands, *Coastal marshes, *Permits, Legislation, Salt marshes, Tidal marshes, Estuaries, Estuarine environment, Dredging, State governments, Public rights, Balance of nature, Wildlife conservation, Non-structural alternatives, Administration, Administrative agencies, Regulation, Land tenure, Pollution abatement, Riparian land, Riparian rights, Marine fisheries, Shellfish, Legal aspects.

In order to protect New Jersey's coastal wetlands, permits for the dredging, filling, removing, altering, or polluting of such areas are required by this Act. The Commissioner of Environmental Protection shall inventory and map all coastal wetlands within two years of the effective date of the Act and may adopt, modify, or repeal regulations concerning the issuance of permits. In granting, denying, or limiting any permit the Commissioner must consider the effect of the proposed activity upon: (1) the public health and welfare; (2) marine fisheries; (3) shell fisheries; (4) wildlife; (5) the protection of life and property from flood, hurricane, and other natural disasters; and (6) the ecological balance of the estuarine zone. Failure to comply with orders issued pursuant to this Act, or to obtain required permits, is punishable by fine. The Act also provides for: (1) public hearings prior to the promulgation of regulations; (2) notice by publication, in writing, to affected property owners; (3) the right to judicial review; and (4) the preservation of all existing rights of the state and obligations of riparian owners. (Earl-Florida)

WATER QUALITY STANDARDS (INTERSTATE WATERS OF IOWA).
Federal Register, Vol 35, No 92, p 7379-7380, Tuesday, May 12, 1970.

Descriptors: *Iowa, *Water quality, *Interstate rivers, *Water pollution treatment, Administrative agencies, Federal government, Administrative decisions, Waste dilution, Disinfection, Water purification, Phenols, Chemicals, Chemical wastes, Industrial wastes, Water pollution sources, Water distribution (Applied), Water treatment, Waste water treatment, Waste treatment, Temperature, Thermal pollution, Thermal water.
Identifiers: *Federal Water Pollution Control Act.

Pursuant to the Federal Water Pollution Control Act, the Secretary of the Interior herein establishes water quality standards for certain interstate waters of Iowa. Dilution shall not be a substitute for proper waste treatment. Heat from man-made resources shall not raise the mean daily water temperature more than 5 degrees Fahrenheit and shall not exceed a safe temperature for each individual water body; in any case the temperature shall not exceed 90 degrees Fahrenheit. Concentrations of phenols from other than natural sources shall not exceed one part per billion. Waters designated as a source of public water supply shall be of such quality that USPHS Drinking Water Standards for finished water can be met after conventional water treatment. No later than December 31, 1937, all municipal and industrial wastes discharged into the Mississippi and Missouri Rivers shall receive a minimum of secondary treatment to achieve a 90% reduction of BOD prior to discharge. Continuous disinfection shall be provided for all municipal waste treatment effluents and other wastes where such wastes are discharged into interstate waters designated for public water supplies or recreational use. (Robinson-Florida)

PROTECTION AND CONSERVATION OF WILDLIFE.

16 USCA secs 666f thru 666g, 668cc-1 thru 668cc-6 (Supp 1970).

Descriptors: *Legislation, *Wildlife conservation, *Administrative agencies, *Fish conservation, Administrative decisions, Federal government, United States, Wildlife habitats, Balance of nature, Wildlife management, Conservation, Ecology, Hunting, Habitat improvement, Foreign countries.

Certain United States lands are transferred to the administration and control of the Secretary of the Interior by this legislation. The purpose of the act is to provide a program for the conservation, protection, restoration, and propagation of selected species of native fish and wildlife which are threatened with extinction. To accomplish these purposes, the Secretary of the Interior is authorized to acquire land within the area administered. The Secretary is required to coordinate with other agencies and encourage efforts to further the purposes of the act. Importation into the United States of fish or wildlife which is threatened with worldwide extinction is prohibited. Every five years, the Secretary is required to determine which species of fish or wildlife are endangered according to the following factors: (1) impairment of habitat, (2) over-utilization of the habitat for commercial or sporting purposes, (3) disease or predation, or (4) other natural or man-made factors affecting the existence of any species. Civil penalties for violation of the section are limited to $5000; however, a criminal penalty of $10,000 or imprisionment for one year may be imposed for willful violation of the act. In addition, the Secretary is required to encourage foreign nations to protect endangered wildlife. (Hart-Florida)

W71-06617

THE POLITICS OF WATER RESOURCE MANAGEMENT THROUGH ARIZONA WATER-RELATED REGULATORY AGENCIES,
Arizona Univ., Tucson. Dept. of Government.
J. A. Null.
PhD Thesis, 1970. 316 p, 3 fig, 15 tab, 387 ref, 4 append. OWRR Project B-003-ARIZ (13).

Descriptors: *Arizona, *Water users, *Political aspects, *Administrative agencies, State governments, Governments, Administration, Regulation, Water rights, Political constraints, Water resources, Water resources development, Legal aspects, Water utilization, Water demand, Water supply.

Centering on the policy-formulating process in water agencies, this dissertation explains how water regulatory agencies function in Arizona. Legal powers of agencies and their behavior in regard to these powers are compared. The study concludes that administrative laws and procedures are the result of interest group activity against the state administrative bureaucracy. Commercial and municipal interests are challenging the monopoly of farm-ranch and conservation oriented association influence in water management. There are fourteen agencies with power to regulate the use of water in Arizona; the State Land Department and the Arizona Corporation Commission have the broadest areas of jurisdiction. The author maintains that the state government must assume a vigorous role in water management. The state must solve two problems: (1) revision of water law and (2) administrative reform. The best method of solving these problems is by establishment of a state administrative agency with power to investigate, plan, and coordinate the management of water usage. The author recommends the commission form of administrative agency. He feels that this form of agency would provide broad representation for varied water interests. The author concludes that such a solution is politically feasible. (Robinson-Florida)

WATER RESOURCES ON THE PUBLIC LANDS--PLLRC'S SOLUTION TO THE RESERVATION DOCTRINE,
Frank J. Trelease.
Land and Water Law Review, Vol 6, No 1, p 89-107, 1970. 35 ref. OWRR Project A-999-WYO (14).

Descriptors: *Reservation doctrine, *Federal reservations, *Federal-state water rights conflicts, *Water supply, Administration, Administrative agencies, Legal aspects, Federal government, State governments, Compensation, Prior appropriation, Water rights, Federal jurisdiction, State jurisdiction, Water demand, Water resources, Water resources development, Water shortage, Planning, Water utilization, Economic impact, Water law.

This article deals with that portion of the Report of the Public Land Law Review Commission pertaining to the reservation doctrine. After a summary of the Report and its recommendations, the following areas are discussed: quantification of the problem, procedures for administrative determination of the reasonableness of quantities claimed, and compensation. The two most important problems to be resolved are the uncertainty engendered by the doctrine and the equity of holders of water rights vested under state law. The Commission recommended that the implied reservation doctrine of water rights for federal lands should be clarified in four ways: (1) amounts of water claimed should be formally established; (2) procedures for contesting claims should be provided; (3) water requirements for future reservations should be expressly reserved; and (4) compensation should be awarded where interference results with claims valid under state law before the decision in Arizona v. California, 373 U.S. 546 (1963). The author disagrees with the Commission in that he feels a case by case approach is best for settling disputes in this area, but agrees that water users harmed by exercise of the reservation doctrine should be compensated. The author concludes that the Commission's recommendations should be tried and supported to determine their efficacy. (See also W71-06621 thru W71-06623) (Robinson-Florida)
W71-06620

LET THERE BE NO NAGGING DOUBTS: NOR SHALL PRIVATE PROPERTY, INCLUDING WATER RIGHTS, BE TAKEN FOR PUBLIC USE WITHOUT JUST COMPENSATION,
Charles E. Corker.
Land and Water Law Review, Vol 6, No 1, p 109-115, 1970. 6 ref.

Descriptors: *Reservation doctrine, *Compensation, *Federal-state water rights conflicts, *Water supply, Federal reservations, Administration, Administrative agencies, Legal aspects, Water law, Federal government, State governments, Prior appropriations, Water rights, Federal jurisdiction, State jurisdiction, Water demand, Water resources, Water resources development, Water shortage, Planning, Water utilization, Economic impact.

The author of this article contends that when the United States exercises the reservation doctrine and utilizes water formerly used by private citizens, it should pay for it. The Public Land Law Review Commission made four proposals dealing with the reservation doctrine: (1) federal agencies should ascertain and given public notice of the projected water requirements for reserved areas for the next forty years; (2) procedures for contesting every claim should be established; (3) future reservations of public lands should be accompanied by a statement of prospective water requirements and an express reservation of such quantity of water; and (4) compensation should be awarded where such reservation results in interference with claims valid under state law prior to Arizona v. California, 373 U.S. 546 (1963). The author contends that it would be impossible to determine the projected water requirements for the next forty years and that it is impractical to attempt to determine prospective water requirements for future reservations of public land. He believes that judges unspecialized in water administration are not equipped to handle water rights cases. The author also feels that there is no valid reason for distinguishing between appropriations of water before and after 1963. (See also W71-06620) (Robinson-Florida)
W71-06621

THE IMPLIED RESERVATION DOCTRINE: POLICY OR LAW,
John A. Carver, Jr.
Land and Water Law Review, Vol 6, No 1, p 117-122, 1970. 11 ref.

Descriptors: *Reservation doctrine, *Compensation, *Federal-state water rights conflicts, *Water supply, Federal jurisdiction, Federal reservations, Jurisdiction, State jurisdiction, Water rights, Federal government, State governments, Administration, Administrative agencies, Legal aspects, Water demand, Water resources, Water resources development, Water shortage, Planning, Economic impact, Condemnation value, Water utilization.

Compensation for vested water rights taken by the federal government pursuant to the implied reservation doctrine is evaluated in this article. The author considers that portion of the Report of the Public Land Law Review Commission dealing with the implied reservation doctrine and the judicial background of the doctrine. The author contends that the Commission's proposal that the federal government should determine its water requirements 40 years in advance is impractical. He also feels that a sensible system of water rights ought to include security, and that there should be no uncompensated transfer of water rights from one user to another. Because of the bureaucratic tendency to avoid the charge of having given away federal rights, the author recommends that Congress provide specific guidelines for compensation. The Commission seems to regard court-made law as less susceptible to congressional amendment than statutory law, but the author concludes that this may be irrelevant, since the Flood Control Act of 1944 provides for compensation for the taking of a water right vested by the laws of the concerned state. (See also W71-06620). (Robinson-Florida)
W71-06622

DISCUSSION: WATER RESOURCES.
Land and Water Law Review, Vol 6, No 1, p 123-133, 1970.

Descriptors: *Reservation doctrine, *Federal-state water rights conflicts, *Water supply, *Water resources development, Federal reservations, Compensation, Water rights, Federal government, Developed waters, Planning, Administrative agencies, Legal aspects, Water demand, Water policy, Regulation, Condemnation values, Prior appropriation, Water sources, Water utilization, Water resources, Water requirement, Water users, Judicial decisions.

The oral discussion recorded considers: (1) the background of the Pelton Dam case, (2) the implied reservation doctrine as it affects future use and disposal of public lands, and (3) circumvention of the implied reservation doctrine. According to Mr. Corker the decision in the Pelton Dam case is sound law. Mr Barry contends that the implied reservation doctrine is not a problem and that the United States only owns that water sufficient to carry out the purposes of the reservation, not all that arises on the reservation. He further feels that the federal government intends to compensate people whose vested water rights are taken under the doctrine. Mr Marty states that water is wasted if not used and that certainty should be established to encourage maximum use of water. Mr. Clark maintains that the Pelton Dam case does not involve water rights. Mr. Carmichael disagrees with Mr. Marty's statement that water is wasted if not used. Development by either the industrialist or the farmer will require certainty of water rights according to Mr. Clyde. (See also W71-06620). (Robinson-Florida)

CONSERVATION COMMISSIONS IN MASSACHUSETTS: WITH A SUPPLEMENTARY REPORT ON THE EMERGENCE OF CONSERVATION COMMISSIONS IN SIX OTHER NORTHEAST STATES,
Conservation Foundation, Wash., D.C.; and New England Conservation Services Center, Lincoln, Mass.
Andrew J. W. Scheffey, and William J. Duddleson.
New England Conservation Services Center, Lincoln, Massachusetts, 1969. 216 p, 15 photo, 1 tab, 1 append.

Descriptors: *Massachusetts, *Conservation, *Organizations, *Local governments, New England, Northeast U.S., Rhode Island, Connecticut, New Hampshire, Maine, New York, New Jersey, Water conservation, Land resources, Water resources development, State governments, Legislation, Administrative agencies, Natural resources, Pollution abatement, Environmental effects, Air polution, History, Social aspects, Political aspects, Legal aspects.

The emergence of local conservation commissions throughout the Northeast is a significant pehnomenon, both as a political development and as an expression of the public's growing concern for environmental quality. A study of the municipal conservation commission concept in Massachusetts, where the movement originated, reveals its successes in the acquisition and protection of open space and wildlife areas, in creating grassroots interest in pollution control, and in acting as a catalyst for conservation action by other local and state agencies and by private interests. The conser-

vation commission has been tested and found to be a practical local instrument for environmental improvement. The growth of the movement is outlined within a broad historical perspective. The legislative steps that have fostered its growth include self-help acts and a specific Conservation Commission Act. A questionnaire survey of all such commissions in Massachusetts reveals certain principles of effective operation that are beginning to emerge. A supplementary report on the emergence of local conservation commissions in six other Northeast states indicates the growing acceptance of the viability of such commissions in improving the quality of air, land, and water resources development. (Smiljanich-Florida)

GEOTHERMAL STEAM ACT OF 1970 (EXPLOITATION AND DEVELOPMENT OF GEOTHERMAL STEAM RESOURCES).
Pub L No 91-581, 84 Stat 1566, 15 US Code Cong and Admin News, p 6778-6788 (1970). 11 p.

Descriptors: *Thermal water, *Steam, *Mineralogy, *Administration, Administrative agencies, Legislation, Thermal properties, Leases, Permits, Natural resources, Federal government, Water types, Wells, Drilling, Exploration, Exploitation, Mining, Conservation, Energy, Heat, Gases, Oil, Helium, Resource development.
Identifiers: *Geothermal Steam Act, *Geothermal steam.

Authorizing the Secretary of the Interior to make disposition of geothermal steam and associated geothermal resources, the Congress of the United States enacted the Geothermal Steam Act of 1970. The Act defines geothermal steam and associated resources, including: (1) all products of geothermal processes, enbracing indigenous steam, hot water, and brines; (2) similar products resulting from water, gas or other fluids artificially introduced into geothermal formations; (3) heat or other associated energy found in geothermal formations; and (4) any byproduct derived therefrom. The term byproduct is defined as any mineral (exclusive of oil, hydrocarbon gas, or helium) found in geothermal formations which has insufficient value to warrant extraction by itself. The Secretary of the Interior is authorized to issue leases for development and utilization of geothermal steam resources and to formulate regulations governing leases. Leases shall be secured by competitive bidding. The Act provides for: (1) maximum acreage of leases per person, (2) royalty payments to the government, (3) duration of leases, (4) termination and adjustment of leases, (5) duties of lessees in the exploration and exploitation of geothermal steam resources, and (6) coexistence with leases under other federal mining acts. The Secretary of the Interior has broad discretion in formulating regulations to implement the provisions of the Act. (Duss-Florida)

PROPOSED LEGISLATION FOR PRESERVING, RESTORING AND IMPROVING WETLANDS FOR MIGRATORY WATERFOWL.

S Rep No 1393, 91st Cong, 2d Sess, 15 US Code Cong and Admin News, p 7110-7117 (1970). 8 p.

Descriptors: *Waterfowl, *Migratory birds, *Wetlands, *Wildlife conservation, Legislation, Marshes, Swamps, Surface waters, Surface runoff, Federal government, Administrative agencies, Land, Contracts, Costs, Water quality, Flood control, Erosion, Land classification, Groundwater, Water pollution, Breeding, Nests.
Identifiers: *Water Bank Act.

Recommending passage of a House bill (H.R. 15770) entitled the 'Water Bank Act', which ultimately was enacted as Public Law 91-559, this Senate report discusses the background and need for the bill, gives a section-by-section analysis, and reprints two departmental reports opposing the bill. The principal objective of the bill is to preserve the habitat of migratory waterfowl by preserving, restoring, and improving wetland areas. The bill is necessary because numerous acres of waterfowl habitat are being lost due to the demands of civilization and because existing legislation providing for acquisition of wetlands by the Department of the Interior has proved inadequate. The bill authorizes the Secretary of Agriculture to enter into ten-year renewable contracts with landowners and operators of important waterfowl areas for conservation of water in wetlands. Various sections describe: (1) the land available for the program, (2) the obligations of those entering into contracts, (3) the method of payment for contracts, (4) contract renewals, (5) termination of contracts, and (6) maximum appropriations during any calendar year. The Departments of Agriculture and Interior opposed the bill on the basis that any program should be administered through the Department of the Interior. (Duss-Florida)
W71-06651

SENATE REPORT RECOMMENDING PASSAGE OF A FEDERAL ENVIRONMENTAL EDUCATION ACT.

S Rep No 91-1164, 91st Cong, 2d Sess, 13 US Code Cong and Admin News, p 5763-5774 1970. 12 p.

Descriptors: *Environment, *Environmental effects, *Education, *Administration, Administrative agencies, Federal government, Legislation, Ecology, Ecosystems, Resource development, Coordination, Pollution, Oceans, Public health, Schools (Education), Local governments, Government finance, Projects, Technology, Balance of nature, Resources, Rural areas, City planning.
Identifiers: *Environmental Education Act.

Recommending passage of a proposed Environmental Education Act (which ultimately became Public Law 91-516), this Senate report discusses the legislation under three headings: (1) background and purpose, (2) major provisions of the bill, and (3) a section-by-section analysis. The report initially emphasizes the need to inform the public on matters which concern environmental quality. Quotations by various educators indicate the broad approach that is required in environmental education, and a summation describes it as an integrated process embracing such factors as population, pollution, resource allocation and depletion, conservation, technology, and environmental planning. The major provisions of the bill would: (1) establish an Office of Environmental Education, (2) authorize grants and contracts with governmental and educational institutions for projects and programs in environmental education, (3) give guidelines for the use of funds, (4) create an Advisory Council on Environmental Quality Education, and (5) authorize cooperative efforts among federal agencies to provide technical assistance to various institutions engaged in environmental education. The section-by-section analysis considers each part of the bill and includes criteria for approval of applications for financial assistance and the amount of funding for the program. (Duss-Florida)
W71-06662

REORGANIZATION OF EXECUTIVE DEPARTMENTS TO COORDINATE FEDERAL ENVIRONMENTAL POLICIES.

8 US Code Cong and Admin News, p 2996-3010 (1970). 15 p.

Descriptors: *Administrative agencies, *Federal government, *Environment, *Coordination, Ecology, Environmental effects, Water pollution, Water pollution control, Water quality, Water quality control, Air pollution, Solid wastes, Wildlife, Conservation, Pesticides, Standards, Legislation, Oceans, Atmosphere, Marine fisheries, Weather, Natural resources, Resource development, Exploration, Exploitation.

In an effort to systematically organize the federal government's environmental activities, President Nixon submitted to Congress two reorganization plans for the executive branch. The first establishes an Environmental Protection Agency (EPA), which would pull together into one agency a variety of research, monitoring, standard-setting, and enforcement activities now scattered among several departments and agencies. Among the functions transferred to the EPA are: (1) those carried out through the Federal Water Quality Administration, (2) pesticide studies by the Department of the Interior and other agencies, and (3) activities of the National Air Pollution Control Administration and Bureau of Solid Waste Management. The principal roles and functions of the EPA would be: (1) standards-setting, (2) research, (3) providing assistance to other agencies, and (4) developing environmental policies. The second reorganization plan would create within the Department of Commerce a National Oceanic and Atmospheric Administration (NOAA), which would consolidate federal activities concerning development of sea resources and research into oceanic and atmospheric phenomena. Among the activities taken over by the NOAA will be those of: (1) the Bureau of Commercial Fisheries, (2) the Environmental Services Administration, and (3) the Marine Minerals Technology Center. Additionally, certain activities of the Departments of the Army and Navy would be taken over by the NOAA. (Duss-Florida)
W71-06682

PROPOSED FEDERAL FUNDING FOR CONSTRUCTION OF COMMUNITY WATER AND SEWAGE FACILITIES.
HR Rep 91-1263, 91st Cong, 2d Sess, 11 US Code Cong and Admin News p 4225-4229 (1970). 5 p, 1 tab.

Descriptors: *Sewage treatment, *Sewage disposal, *Financing, *Water pollution, Water pollution control, Sewers, Public health, Legislation, Federal government, Cities, Waste disposal, Sewage, Water pollution sources, Local governments, Coordination, Water quality, Pollution abatement, Administrative agencies, Administration, Political aspects, Government finance.

Recommending passage of a House bill (H.R. 17795 which ultimately became Public Law 91-431) to provide funds for water and sewer facilities, this report by the Committee on Banking and Currency sets out the important aspects of the legislation. Included in the report are: (1) the objectives of the bill, (2) its background, (3) why the bill is needed, (4) the availability of funds for projects in small towns, (5) additional views of the committee, and (6) dissenting views. The bill amends Title VII of the Housing and Urban Development Act of 1965 and would: (1) help finance construction of urgently needed public facilities to provide for the public health and check water pollution, (2) reenact the balance of the authorization for basic water and sewer facilities under the 1965 Act, (3) make an additional one billion dollars available for grants, and (4) extend the time in which a community could qualify for a basic water and sewer facilities grant. The bill is necessary because local communities do not have the resources to provide needed water and sewer facilities. Funds would be available for projects in small communities. Dissenting views on the bill emphasized the lack of available funds to finance the proposed projects. (Duss-Florida)

WATER RIGHTS LAW CONFERENCE,
New England Council of Water Center Directors, Boston, Mass.

Proceedings, Water Rights Law Conference, Boston, Mass, November 10, 1966. New England Council of Water Center Directors, n.d. 116 p, 1 map, 110 ref. OWRR Project A-999-MASS (1).

Descriptors: *New Hampshire, *New England, *Water rights, *Conferences, Water law, State governments, Federal government, Water pollution, Water pollution control, Water pollution effects, Water pollution sources, Pollution abatement, Water resources development, Natural flow doctrine, Riparian rights, Water Resources Planning Act, Water Resources Research Act, Water Quality Act, Public rights, Water utilization, Alteration of flow, Access routes, Diversion, Repulsion (Legal aspects), Prior appropriation.

The topics covered in these proceedings of the Water Rights Law Conference include: (1) basic concepts of private water rights; (2) public water use rights; (3) federal-state cooperative research in water law and institutions; (4) diversions and alterations of stream flow; (5) the law relating to access to public waters in New Hampshire; (6) multiple use and water law; (7) multiple-use problems of water law in New Hampshire; and (8) water-rights laws in New England. In the first presentation such basic terms as navigability, riparian doctrine, prior appropriation, reasonable use doctrine and common enemy rule are covered. At the end of the first presentation is a series of questions from the conference floor, and the answers furnished by the speaker. The discussion of federal-state cooperative water law research notes three needs to solve water problems: (1) research programs; (2) a national water resources agency; and (3) a federal-state pollution control program. The speaker postulates that this need has been satisfied with enactment of the Water Resources Research Act, Water Resources Planning Act, and the Water Quality Act. The speaker analyzes the effect of these acts upon water problems. (See also W71-06902 thru W71-06909) (Hart-Florida)

BASIC CONCEPTS IN PRIVATE WATER RIGHTS,
James H. Kendall, and Richard E. Whiting.
In: Proceedings, Water Rights Law Conference, Boston, Mass, November 10, 1966. New England Council of Water Center Directors, n.d., p 5-33. 52 ref.

Descriptors: *New England, *Riparian rights, *Prior appropriation, *Water law, Natural flow doctrine, Navigable rivers, Navigation, Navigable waters, Federal govenmemt, State governments, Alteration of flow, Artificial use, Competing uses, Domestic water, Legal aspects, Natural use, Obstruction to flow, Reasonable use, Riparian waters, Stock water, Water pollution, Waste disposal.

In New England states the riparian doctrine determines the relative rights of individuals to use water flowing in a natural watercourse. It is applied to surface flow of rivers and streams and to underground waters in defined watercourses. The riparian doctrine is inapplicable to non-navigable waters. All use of navigable waters is subjected to the federal power over commerce and navigation. The doctrine of prior appropriatons gives priority of water usage to the chronologically earliest beneficial use. The doctrine of prior appropriation is codified. Each riparian lawful purposes and detain all the streamflow for domestic uses. Downstream riparians have a remedy, if only for nominal damages, when the upstream owner unreasonably obstructs or detains the streamflow. If the downstream owner fails to sue within the statue of limitations his rights are forfeited. However, in some jurisdictions no cause arises if no harm is done to the lower riparian owner. The stream may be used for discharge of wastes; decisions hold waste discharge is to be tested by the reasonable use doctrine. However, discharge of wastes is subjected to attack on a nuisance theory. (See also W71-06901) (Hart-Florida)

COMMENTS ON PUBLIC WATER USE RIGHTS,
Orlando E. Delogu.
In: Proceedings, Water Rights Law Conference, Boston, Mass, November 10, 1966. New England Council of Water Center Directors, n.d., p 34-43. 34 ref.

Descriptors: *Public rights, *Water rights, *Water utilization, *State governments, Navigation, Navigable waters, Water resources, Water resources development, Public benefits, Water law, Legal aspects, Reservation doctrine, State jurisdiction, Federal jurisdiction.

The concept of public use water rights was conceived by Justinian, and Bracton used the theory in his early common law treatises. Navigability is the ultimate test used to determine whether waters are subject to public water use rights. Since the definition of 'navigable' has been expanded to a point where almost all waters can be called navigable, public water use rights are now more prevalent than a common law. The state, as the institutional embodiment of the public, is deemed the trustee of the water rights; hence enforcement of a member's rights must be effected through the state. A state may regulate and control navigable waters by exercise of its plenary sovereign and police powers. States have enlarged the scope of public water use rights by: (1) redefining 'navigable'; (2) building dams and creating lakes; (3) facilitating access to waters by building roads; (4) purchasing and condemning pirvate water rights for public use; and (5) judicial and administrative redefining and narrowing of the concept of reasonable and beneficial use. The public clamor for more and better water necessitated the enlargement of public water use rights. (See also W71-06901) (Hart-Florida)
W71-06903

FEDERAL-STATE COOPERATIVE RESEARCH IN WATER LAW AND INSTITUTIONS,
Roland R. Renne.
In: Proceedings, Water Rights Law Conference, Boston, Mass, November 10, 1966. New England Council of Water Center Directors, n.d., p 44-54.

Descriptors: *Water Quality Act, *Water Resources Planning Act, *Water Resources Research Act, *Water resources development, Legislation, Federal government, State governments, Water law, Water pollution, Water pollution control, Projects, Grants, Research and development.

To solve the nation's major water problems, three vital needs must be met: (1) a coordinated, continuing, scientific water resources research program to increase available supplies and to increase efficiency in water use; (2) a national water resources review office or council for coordinated, continuing, comprehensive planning of water resources development and management for all major river basins, including active participation by the states through a program of grants for water resources planning; and (3) an effective federal-state water pollution control program with authority to establish and enforce water quality standards for preventing further pollution and clearing up existing pollution. The needs have been met by passage of the Water Resources Research Act, the Water Resources Planning Act, and the Water Quality Act. The new cooperative research program has demonstrated great potential strength in helping solve serious water problems. Current federal expenditures supporting water resources research are at $100 million annually. There are 18 projects funded under the Water Resources Act which deal with water law and institutions. Although the program under the Research Act is only two years old. 2/5 of the states have made excellent progress. (See also W71-06901) (Hart-Florida)

DIVERSIONS AND ALTERATIONS OF STREAM FLOW,
Robert L. Leonard.
In: Proceedings, Water Rights Law Conference, Boston, Mass, November 10, 1966. New England Council of Water Center Directors, n.d., p 55-66. 1 map, 17 ref.

Descriptors: *Diversion, *Alteration of flow, *Natural flow doctrine, *Relative rights, Reasonable use, Withdrawl, Streamflow, Obstruction to flow, Reservoirs, Irrigation practices, Riparian rights, Water rights, Irrigation programs, Irrigation wells, Pumping plants, Water allocation (Policy), Water distribution (Applied), Industrial water, Cities, Condemnation, Eminent domain, Compensation, Conservation, Dams.

Technological changes and recent drought have resulted in substantial investments in irrigation equipment by farmers, nurserymen, and golf-course operators. Hence, the quantity of water used for irrigation will increase. However, the increases in irrigation have not created unusual controversy over private water rights; where natural flow has been inadequate to supply new needs, the deficit has usually been furnished from storage ponds or high capacity wells. Alterations of stream flow result from releases by hydroelectric plants to meet the demand peaks for electricity. Seasonal releases from water storage conform to seasonal demands for electricity. Since there is a paucity of remaining sources for hydroelectric power in New England, future demand will be met with pumped storage. Industries using large quantities of water generally develop their own supply. Although the water quality may be impaired upon return, flow is not seriously altered. State and municipal entities may condemn land, flowage, and water rights by providing compensation. This condemnation power, with one exception, has been free of any requirement to maintain a minimum flow downstream. In one instance, conservation groups induced lawmakers to require a minimum downstream flow. (See also W71-06901) (Hart-Florida)
W71-06905

THE LAW RELATING TO ACCESS TO PUBLIC WATERS IN NEW HAMPSHIRE,
A. J. Kalinske.

In: Proceedings, Water Rights Law Conference, Boston, Mass, November 10, 1966. New England Council of Water Center Directors, n.d., p 67-86.

Descriptors: *New Hampshire, *Access routes, *Right-of-way, *State governments, Local governments, Recreation, Public rights, Water rights, Water utilization, Water law, Legal aspects, Judicial decisions, Legislation, Great ponds, Administrative agencies.

Any natural, fresh-water pond in New Hampshire containing more than 10 acres is a 'great pond' and within the class of public waters. Tidewaters are also considered public. By statute, all natural bodies of water of 20 acres are public. Navigable waters are distinguished from public waters by statutory definition. There has been no standard aprogram for providing for access by the public waters; informational signs were not provided, and state agency responsibility has never been clearly defined. With the increased popularity of recreational boating, the inadequacy of access points became acute; consequently, a project has begun to inventory all public waters and eventually rstablish access points. Whether public water rights exist in waters to which access can only be obtained by trespass has not been decided by New Hampshire courts; however, provisions have been made by statute to furnish access to public waters. Local governments may be petitioned to furnish access, and it may be purchased after proper proceedings. Also, a Right-of-Way Board investigates all transactions involving public lands to determine if a right-of-way to public waters should be retained. A Public Access Advisory Board should be established to select access sites to public waters. (See also W71-06901) (Hart-Florida)
W71-06906

MULTIPLE USE AND WATER LAW,
F. O. Sargent.
In: Proceedings, Water Rights Law Conference, Boston, Mass, November 10, 1966. New England Council of Water Center Directors, p 87-96. 2 ref.

Descriptors: *New England, *Water law, *Water resources development, *Legislation, State governments, Administrative agencies, Water resources, Beds under waters, Ownership of beds, Stream beds, Riparian rights, Water management (Applied), Multiple-purpose projects, Non-structural alternatives, Water allocation (Policy), Conjunctive use, Multiple purpose, Optimum development plans, Water pullution, Watersheds (Basins).

The two major bodies of water law--common law and statutory law--are inadequate guides to water resource development. The common law arose in England, where water is plentiful. Although the common law has been modified in America, it has always been inadequate for managing water resources development where water was scarce and multiple uses conflict. Statues governing pollution and water quality are well developed, but other statutory provisions have not been revised, updated, or supplemented to regulate current water resource development problems. The following legislation is necessary: (1) clarifying rights in streambeds; (2) governing minimum streamflow; (3) providing for public access to public waters; (4) describing the procedures to be followed and the state agencies responsible when anyone desires to alter beds under water; (5) revising water management and administration procedures; and (6) providing procedures for water and stream bank zoning. Furthermore, the multiple-use concept of water requires a river basin approach to water resource law. Four types economic analyses should be made for all major resource development projects: (1) benefit-costs; (2) economic development potential; (3) location theory; and (4) opportunity-cost. (See also W71-06901) (Hart-Florida)
W71-06907

MULTIPLE-USE PROBLEMS OF WATER LAW IN NEW HAMPSHIRE,
Robert H. Forste.
In: Proceedings, Water Rights Law Conference, Boston, Mass, November 10, 1966. New England Council of Water Center Directors, n.d., p 97-106. 1 ref.

Descriptors: *New Hampshire, *New England, *Multiple purpose, *Public rights, Water rights, Water pollution, Water pollution control, Water utilization, Natural flow doctrine, Riparian rights, Riparian waters, Recreation, Swimming, Dams, Flood control, Sewage, Sewage cisposal, Waste disposal, Legal aspects, Water law, Judicial decisions, Reasonable use, Beneficial use, Water resources, Water distribution (Applied).

Throughout New England conflicts increasing in both number and intensity are occurring in the competition for varied uses of water. The riparian rights doctrine governs water use in New Hampshire; all riparian owners may reasonably use and enjoy the water and have the right to natural flow. Upstream and downstream owners have equal rights. 'Great ponds' in New Hampshire are public waters. Six multiple-use conflicts are: (1) flood control, recreation, and public water supplies; (2) sewage-waste disposal and recreation; (3) powder, recreation, waste disposal, irrigation, and public water supplies; (4) power, pollution and recreation; (5) mineral exploitation and recreation/esthetics; and (6) public water supplies and recreation. The absence in water law of two economic elements is reflected in the inability of case law to deal with external effects and the general absence of a price system to assist in water allocation. Economists should be able to furnish courts and commissions with policy alternatives available in regulating water use. Courts must be willing to accept input from the economist before handling down a 'reaonable use' decision concerning water law. (See also W71-06901) (Hart-Florida)
W71-06908

WATER RIGHTS LAWS IN NEW ENGLAND: SUMMARY AND OBSERVATIONS,
Harold H. Ellis.
In: Proceedings, Water Rights Law Conference, Boston, Mass, November 10, 1966. New England Council of Water Center Directors, n.d., p 107-115. 1 ref.

Descriptors: *New England, *Water utilization, *Water resources development, *Legislation, Water rights, Riparian rights, Riparian land, Public rights, Access routes, Water allocation (Policy), Water distribution (Applied), Drainage, Water pollution, Water pollution control, Pollution abatement, Floods, Flood control, Obstruction to flow, Dams, Diversions, Eminent domain, Condemnation, Compensation, Prescriptive rights, Legal aspects.

As water-use conflicts increase in quantity and intensity, water rights laws become more important. Neigher common law nor legislation has kept pace with water-use conflicts; hence additional legislation will be necessary to cope with emerging water problems. Some of these emerging problems are: (1) the respective roles of courts, governments and administrative agencies; (2) definitions of riparian rights, riparian land, and permissibility of non-riparian use; (3) private versus public rights, conflicting public uses, and public access problems; (4) coordination of water allocation and pollution control, water development, drainage or flood control measures; (5) which kinds of pollution control measures to adopt; (6) obstructions to watercourses; (7) uses of zoning, eminent domain, and minimum stream-flow provisions; (8) coordination of rights in or regulation of interconnected sources of water; (9) prescriptive water rights; (10) compatibility of water laws with technical knowledge and innovations concerning the state, multiple use, and development of water resources; (11) certainty and flexibility of water allocation systems; and (12) reliance upon market forces to allocate water resources. Development of proposals for legislative and other methods of alleviating water problems must be facilitated by technicians, lawyers economists, and public officials. (See also W71 06901) (Hart-Florida)

GOVERNOR'S CONFERENCE ON WATEI RESOURCES MANAGEMENT IN WISCONSIN.
Available from Wisconsin Water Resource Center, Madison 53706 for $1.00. Selected Paper and a Summary of the Proceedings of Governor' Conference on Water Resources Management Madison, October 14 and 15, 1965. University o Wisconsin, Water Resources Center, Madison March 1966. 76 p.

Descriptors: *Wisconsin, *Water resource development, *Planning, *Water managemen (Applied), Water resources, Long-term planning Federal government, State governments, Legisla tion, Water quality control, New York, Agricul ture, Conservation, Industries, Cities, Recreation Economics, Water requirements, Pollution abate ment, Water rights, Legal aspects, Administrativ agencies, Supervisory control (Power).

At the request of the Governor of Wisconsin, th Governor's Committee on Water Resources spon sored a conference on water resources manage ment. The purposes of the conference were: (1) t provide the members of the committee with a cur rent picture of the state's water problems and (2 to act as a sounding board for citizens of the stat concerned with water resources. Addresses con tained herein deal with: (1) water resources an Wisconsin' future; (2) water resources plannin and development; (3) the impact of federal legisla tion on Wisconsin's water quality and wate resources; (4) a case study of water resource planning in Wisconsin; (5) water resource planning in New York; (6) water resource management in Wisconsin from the viewpoint o agriculture, conservation, industry, municipalities and recreation; (7) the economics of wate management, (8) water needs and water resources (9) water pollution control; (10) water rights an legislation; and (11) conservation and recreation Suggestions posed by the discussion groups in cluded the need for reorganization of the agencie dealing with water resources, reworking of th statues relating to water use, and reconsideration o the constitutional restriction forbidding works o internal improvement by the state. FEDERAL LEGISLATION--WATER QUALITY AND WATER RESOURCES--IMPACT ON WISCONSIN,
Wisconsin Univ., Madison. Water Resource Center.
Gerald A. Rohlich.
In: Selected Papers and a Summary of th Proceedings of Governor's Conference on Wate Resources Management, Madison, October 14 an 15, 1965. University of Wisconsin, Wate Resources Center, Madison, March 1966, p 10-12

Descriptors: *Wisconsin, *Water Resource Research Act, *Water Resources Planning Ac *Water Quality Act, Federal government, Ad ministrative agencies, Water resources develop ment, Federal jurisdiction, Federal-state wate rights conflicts, State governments, Legislatio Planning, Administration, Research and develop ment, River basin development, Water quality Water pollution, Eutrophication, Coordination, In dustrial wastes, Municipal wastes, Storm drain Standards, Legal aspects, Water allocation (Po icy).

The passage of three federal acts provides a avenue of joint federal-state cooperation in wate resource research, planning, and quality contro The Water Resources Research Act makes fund available for the conduct of water resource research in the broad sense. Such funds in Wisco sin are administered by the Water Resource

enter. The two major areas of research have in-lved the problem of eutrophication of lakes and at of river basin planning and coordination. The ater Resources Planning Act establishes the deral Water Resources Council. The Council is assess the adequacy of regional water supplies in e United States and study the adequacy of ad-nistrative and statutory means for the coordina-n of water resources policies and programs. isconsin is particularly interested in that part of e Act which makes funds available to assist in veloping comprehensive water resource plans. e Water Quality Act of 1965 establishes the deral Water Pollution Control Administration. e Act recognizes the problems of pollution used by the discharge of municipal and industrial stes and storm water sewerage. The Act sets th procedures relative to the adoption by the tes of water-quality criteria applicable to in-state waters. (See also W71-6910) (Smiljanich-orida)

ATER RESOURCES PLANNING IN NEW ORK,
lson A. Rockefeller.
Selected Papers and a Summary of the oceedings of Governor's Conference On Water sources Management, Madison, October 14 and , 1965. University of Wisconsin, Water Resource nter, Madison, March 1966, p 18-20.

escriptors: *New York, *Wisconsin, *Water sources development, *Long term planning, ate governments, Federal government, Local vernments, Cities, Future planning (Projected), nancing, Cost sharing, Coordination, Estimated sts, Research and development, Administrative encies, Water management (Applied), Adminis-tion, Pollution abatement, Municipal wastes, In-strial wastes, Sewage treatment, Political pects, Legal aspects.

sed on the New York experience, it is the thor's belief that the states have the largest ligation and opportunity for leadership in the ld of water resources development. New York organized its water resources management agen-s under central control. Regional water sources planning and development boards insure ass-roots participation and bring about coordina-n at the local level of local, state and federal ac-ity. At the same time, the centralizing of state licy making and leadership permits the state to an effective agent in any cooperative studies th federal and local agencies. The problem of ancing pollution abatement has led to the eaker's proposed Pure Waters Program. The goal this program is to clean up municipal and indus-al pollution in the state in six years. The heart of e Program is the state's leadership in a plan ereby local, state, and federal governments are the cost of constructing interceptor sewers d sewage treatment plants. Changes in federal ancial assistance are proposed. The centraliza-n of water management at the state level is a key ctor in the progress thus far achieved. (See also 71-06910) (Smiljanich-Florida)
71-06912

TATEMENT OF ASSEMBLYMAN GEORGE M ORG,
eorge M. Borg.
Selected Papers and a Summary of the oceedings of Governor's Conference On Water sources Management, Madison, October 14 and , 1965. University of Wisconsin, Water sources Center, Madison, March 1966, p 68-69.

escriptors: *Wisconsin, *Water resources velopment, *Administrative agencies, *Water anagement (Applied), Legislation, State govern-ents, Local governments, Financing, Cost shar-g, Pollution abatement, Municipal wastes, Indus-al wastes, Sewage treatment, Legal aspects, eatment facilities, Research and development, doption of practices, Decision making, Institu-tions, Water policy, Grants, Administrative deci-sions.

Assembly Bill 875, which the author introduced into the Wisconsin State Legislature, would create an independent agency with central authority to consolidate all water-control functions. The new Department of Water Resources would be designed to promote the full utilization and conservation of the state's public waters. The Department and its director would be aided by a nine-man advisory committee representing various interests. The functions of the department would be: (1) to inspect all public water supplies and sewage systems and plants, (2) to approve construction plans for public plants and for control measures in private plants producing wastes, (3) to hold hearings and issue and seek enforcement of orders for the prevention or abatement of water pollution, (4) to sponsor research on the protection of water resources, and (5) to administer state and federal aid for pollution control. A program of state aid to local governments would be established by the Bill. Private industry and public and private agencies would be encouraged to conduct research on the problem of industrial wastes. Funding measures are also provided. (See also W71-06910) (Smiljanich-Florida)
W71-06913

WATER LEGISLATION IN THE 90TH CONGRESS.
League of Women Voters, Washington, D.C.

Water Resources Current Review No 5, February 1969. 16 p.

Descriptors: *Legislation, *Water resources, *Water resources development, *Federal government, Political aspects, Institutional constraints, Legal aspects, Erosion control, Estuaried, Nuclear powerplants, Desalination plants, Water pollution control, Water quality control, Grants, Apprioriations, Oil wastes, Financing, Pollution abatement, Flood plain insurance, Water policy, Sediment control, Sewage treatment, Ships, Regulation, Non-structural alternatives.
Identifiers: Scenic Rivers Act, National Water Commission Act, Colorado River Basin Project Act.

The merits, adequacy, and legislative history of water legislation of the 90th Congress are examined in this study. The prospects of future water resource legislation are also considered. Legislation passed by the 90th Congress includes: (1) the Colorado River Basin Project Act, (2) the Scenic Rivers Act, (3) the National Water Commission Act, (4) the flood insurance provision of the 1968 HUD Act, and (5) an Act authorizing an estuarine study. In addition, the Great Lakes Interstate Basin Compact and federal participation in the Bolsa Island nuclear generating and desalinization plant were approved. Despite passage, the Water Quality Improvement Act and the Oil and Hazardous Substances Pollution Act were not reported out of the conference committee due to the opposition of industrial lobbies. Legislation not considered by Congress, but examined by this study includes: (1) the Surface Mining Reclamation Act; (2) bills restricting vessel-sewage, mine-drainage, and lake pollution; and (3) sediment control bills. Included within the 'modest' water-resource appropriations were $214 million for sewage treatment, $165 million for water and lateral sewer programs, and $28 million for rural water and waste programs. (Earl-Florida)

AN EVALUATION OF THE PROVISIONS AND POLICIES OF THE OUTER CONTINENTAL SHELF LAND ACT,
Robert B. Krueger.
Natural Resources Journal, Vol 10, No 4, p 763-810, October 1970. 48 p, 174 ref.

Descriptors: *Administration, *Continental shelf, *Exploitation, *Leases, Public rights, Administrative agencies, Decision making, Administrative decisions, Regulation, Natural resources, Environmental effects, Project planning, Federal government, Continental slope, Continental margins, Institutional constraints, Coasts, Contracts, Offshore platforms, Federal project policy, Land use, Oil fields, Boundaries (Property), Legal aspects, Legislation.
Identifiers: *Outer Continental Shelf Lands Act.

The second installment of a two-part evaluation, this article examines the administration of the Outer Continental Shelf Lands Act. The policy objective of maximum benefit to the public is the criterion for the author's observations, analysis, and recommendations. This standard is a composite of: (1) efficient resource management, (2) the encouragement of private participation, (3) federal revenue maximization, (4) technological advancement, (5) encouragement of the multiple use of resources, and (6) environmental-quality protection. The article studies mineral leasing and considers: (1) the existing system of selecting areas for lease, (2) a case study of Santa Barbara, (3) new and proposed offshore regulations, (4) hard minerals, and (5) future developments. The author examines lease-sale size and timing determination. The article examines the existing system, alternative forms, and competitive versus non-competitive lease-allocation systems. The author's study includes the administrative determination of: (1) drilling and production requirements, (2) terms and royalties, and (3) entry requirements. An examination of miscellaneous problems encompasses: (1) boundaries and jurisdiction; (2) real property use; (3) geothermal and fresh water resources; (4) living seabed resources; (5) salvage and treasure recovery; (6) filling, dredging, and dumping; and (7) marine sanctuaries and scientific facilities. (Earl-Florida)

STATUTES AND REGULATIONS GOVERNING PRIVATE WATER WELL CONSTRUCTION AND PUMP INSTALLATIONS,
Wisconsin State Board of Health, Madison. Well Drilling and Sanitation Services.
T. A. Calabresa.
Groundwater, Vol 1, No 2, p 25-32, April 1963.

Descriptors: *Wisconsin, *Water wells, *Legal aspects, Drilling, Public health, Legislation, Ordinances, Statutes, Well regulations.
Identifiers: *Driller licensing, *Pump installer licensing.

The intent of this paper is to discuss the need for laws and regulations governing construction of wells for private water supplies. This will include: (1) why laws and regulations are necessary, (2) need for registration and licensing of drillers and pump installers, (3) how laws and regulations affect uniformity of construction and the desirability of such uniformity, (4) how they encourage the manufacture of new materials and group organization, (5) what a law and code should contain, (6) need of judgment in administering laws and the regulations adopted pursuant thereto, and (7) the difficulties in enforcing laws and regulations including budgetary reasons. The material presented is drawn from Wisconsin's 26 years of private water supply administration and in part from personal experience. Hence, all statements and conclusions made do not necessarily represent the thinking, views or practice of the author's employer. There is a definite need for control over the construction of private water supplies. This can best be accomplished by licensing of drillers and pump installers and the adoption of regulations for the location and construction of wells and the installation of pumps. Such controls will do much to preserve our most precious natural resource, groundwater, and to advance knowledge of the geologic and hydrologic characteristics of aquifers in a state. (Campbell-NWWA)

PROSPECTS FOR METROPOLITAN WATER MANAGEMENT,
American Society of Civil Engineers, Urban Water Resources Research Council, New York.
M. B. McPherson.
Copies available from ASCE, 345 E. 47th St., New York, N.Y. 10017, at $2.00 each. Urban Water Resources Research Council, December, 1970. 192 p, 12 fig, 7 tab, 4 append. OWRR Project C-1536 (No 1992) (5).

Descriptors: *Urban areas, *Water management (Applied), *Institutions of Government, *Administrative agencies, Urbanization, Local governments, Cities, Water policy, Water resources development, Social values, Economic efficiency, Public health, Ecology, Environment.
Identifiers: *Metropolitan, Water processes, Private corporations, Human biological needs, Roles of science and technology.

The report of a study which attempted to take into account: expectations for the environment of future cities; necessary or desirable new administrative arrangements for future public services management; and the expected impact and interaction of emerging technology, urbanization trends, social goals and related matters. The purpose of the study was to search for ways to make more effective use of technology in the improvement of urban living along with more effective allocation and use of metropolitan total fiscal resources. The objective, background, scope and format of the report comprise the first chapter. The text is summarized in Chapter 2, which also contains the conclusions and recommendations. The latter emphasize research needs. Coverage can be surmised from the titles of the remaining text chapters - 'Urbanization: Growth, Problems and Trends'; 'Human Biological and Social Needs; The Roles of Science, Technology and Private Corporations'; 'Metropolitan Physical and Governmental Structure'; 'Adaptations for Modifying Governmental Structure in the Metropolis'; 'Prospects for Governmental Reorganization in Metropolitan Areas'; 'Contemporary Metropolitan Water Management'; and 'Expected Directions in Metropolitan Water Management'. There are four appendices. Approximately 250 pages; over 200 references. (McPherson-ASCE).

AN EXPLORATION OF COMPONENTS AFFECTING AND LIMITING POLICYMAKING OPTIONS IN LOCAL WATER AGENCIES: PHASE II.
Colorado Univ., Fort Collins. Environmental Resources Center.

Available from National Technical Information Service as PB-198 428, $3.00 in paper copy, $0.95 in microfiche. Environmental Resources Center, Colorado State Univ, Fort Collins, Completion Report Series No 22, June 30, 1970. 115 p, 16 fig, 20 tab. OWRR Project B-029-COLO (5).

Descriptors: *Administration, *Constraints, *Decision making, Evaluation, Formulation, Institutional constraints, *Institutions, Local governments, *Methodology, Non-structural alternatives, Planning, *Rural areas, *Water users.

The perceptions, attitudes, orientations, and interaction patterns of water user publics are significant elements in local water systems. In an effort to locate at least one firm parameter of water systems, this research examines the attitudes, interaction, and other behavior of randomized samples of users of five local water agencies. Private and public agencies and rural and urban areas are included in the samples. The findings indicate that traditional, common sense classifications, such as private-public dichotomies or socio-economic classifications, have far less effect on public attitudes toward water agencies, than do volume, type, and content of communication. Systematic differences, however, are present between urban and rural users. Rural users tend to exhibit somewhat more positive images of water management and higher levels of satisfaction than do urban users. The data further indicate considerable, but no complete, independence of water systems from more general political systems. The linkages between systems are limited and occur only at selected points. Water system attitudes and behavior, however, are mutually associated in systematic and regular patterns across the samples. Communications about water with one's peers and the water management influence the water system strongly. The manner and form of influence or constraining effect may vary considerably, but a large amount of influence is consistently present. Generally, high peer discussion trafficks negative images of an agency, but images improve with each added increment of contact with management. Essentially, water systems have very low public visibility which impedes their capacity to sustain themselves.

SPECTRAL ANALYSIS - A PROTOTYPE ST DY,
Bureau of Reclamation, Denver, Colo.
H. T. Falvey, and D. L. King.
Paper presented at the American Society of Ci Engineers Annual Hydraulics Division Conferen Logan, Utah, August 20-22, 1969. 9 p, 8 fig, 1 t 4 ref.

Descriptors: *Frequency analysis, *Turbulen *Stilling basins, Vortices, Jets, Outlets, Hydrau structures, Hydraulics, Instrumentation, Calib tion, Piezometers.
Identifiers: *Spectral analysis.

Many critical areas should be considered wh planning and performing spectral analyses of fl tuating signals. An important consideration planning the analysis is determining how the resu will be used. The analysis of data representing fl tuating water pressures in a prototype stilling ba was used to illustrate these considerations. Accu cy of the analyses should be consistent with des requirements. The equipment used was limited the analysis of the frequency-amplitude spectr at a single point on the structure. The capabilit and limitations of the commercially available strument that was used in this study are discuss Calibration procedures are described. The pro type stilling basin was designed to dissipate energy of high-velocity flow from 2 hollow valves. The basin was covered and the divider w was supported at both top and bottom, provid the opportunity to measure the pressures with significant modification by flexure of the wall. napp-USGS)

EFFICIENCY OF HYDROLOGIC DATA CO LECTION SYSTEMS, ROLE OF TYPE I AND ERRORS,
Arizona Univ., Tucson. Dept. of Systems Engine ing.
Lucien Duckstein, and Chester C. Kisiel.
Research Report, Presented before Sixth Ameri Water Resources Conference, Las Vegas, Neva October 1970. 23 p, 2 fig, 18 ref. OWRR Project 007-ARIZ (6).

Descriptors: *Hydrologic data, *Mathemat models, *Statistical methods, *Risks, *Grou water recharge, Costs, Efficiencies, Optimizati Decision making.
Identifiers: *Null hypothesis.

e purpose of this paper was to: review the overall
oblem of evaluating the efficiency of hydrologic
a collection systems, present a mathematical
sis for evaluating the relationship of risk Type I
d Type II errors to one or more increments of
a, and present examples. Identified were four
ects of error or risk: (a) choice of mathematical
del for the same process, (b) accuracy and
cision of parameter estimates, (c) acceptance of
ng hypothesis or rejection of correct hypothes-
and (d) economic losses associated with error.
these four, the classical hypothesis testing
oblem was specifically evaluated in terms of costs
ociated with producer's (Type I) or consumer's
pe II) errors for simple and composite
otheses. Mathematical models for these
nomic analyses included costs of sample data
d costs of waiting while new data was obtained.
illustrative computational example focused on
hypothesis that natural recharge might be aug-
nted by a system of pumping wells along an
nemeral channel. The relationship of the
othesis testing problem to Bayesian decision
ory was discussed; it was felt that the latter
ory offered a more comprehensive framework
design and use of hydrologic data networks.

ur classes of errors, considered in problems of
l-time control of hydrologic systems, were
cribed as: (a) system representation, (b)
ameter estimation, (c) truncation (in the ap-
ximation of model equations), and (d) roundoff
the use of computers). Of prime concern was a
iew of the important philosophical and practical
ies inherent in system representation and
ametric estimation errors. Included in these two
sses of error were (a) representation problem,
l (b) identification problem. A detailed discus-
n of the identification problem and its relation to
imization theory and statistical estimation
ory was given. System determinancy and in-
erminancy was defined in terms of the number
variables, data points, and equations and
borated in terms of design, identification and
ameter estimation problems. Issues involved in
osing among models were: model validation,
arent and inherent randomness, and lumped
l distributed parameter models interpreted by a
quency domain method. A heat flow problem
s modeled by the latter methods and interpreted
autocorrelation and spectrum functions for the
ped model. A outline of Bayesian decision
ory was presented and applied to evaluating the
t of uncertainty in the design of bridge piers.
certainty existed in the mean and variance of the

REMOTE 'EYES AND EARS' FOR FLOOD WARNINGS,
Corps of Engineers, Boston, Mass. New England Div.
Frank P. Bane.
The Military Engineer, Vol 63, No 411, p 19-20, January-February, 1971. 2 p.

Descriptors: *Flood control, *Flood forecasting, *Remote sensing, *New England, *Coasts, Hurricanes, Sea water, Hydrologic data, Instrumentation, Methodology, Coastal structures, Wind tides, Computers, Meteorological data, Data transmission, Harbors, Network design, Saline water intrusion, Warning systems.
Identifiers: Flood warnings.

Protection of major port cities in New England which had been repeatedly wrecked by hurricane winds and ocean surges was provided by four barriers against hurricane-induced tidal flooding. To achieve the greatest operating benefits from this protection system, the Automatic Hydrologic Radio Reporting Network has been installed. Accurate and timely regulation of the dams and barriers require hydrologic data which include river, reservoir, and tidal levels; wind velocity and direction; barometric pressure; and precipitation. Many of the remote stations of the system are located in gaging stations operated by the Geological Survey for measuring stream flow. The Network consists of 41 remote reporting stations, 5 remote recording stations, and a central control station at Division headquarters plus 12 repeater and 4 relay points. The operation of the control system is discussed. (Woodard-USGS)

SPATIAL CORRELATIONS OF STORM, MONTHLY AND SEASONAL PRECIPITATION,
F. A. Huff, and W. L. Shipp.
J Appl Meteorol, Vol 8, No 4, p 542-550, Aug 1969. 7 diag, 6 tab, 1 graph, 7 ref.

Descriptors: *Precipitation, *Measurement, *Statistical models, *Rainfall disposition, *Spatial distribution, *Correlation analysis, *Storms, *Rainfall intensity, *Illinois.

One approach to defining sampling requirements for precipitation measurement networks is through statistical correlation methods. Data from three dense rain gage networks in Illinois were used with this method on rainfall measurements ranging from 1-minute rates to total storm, monthly and seasonal amounts. Effects of rain type, synoptic storm type, and other factors on spatial correlations were studied. Correlation decay with distance used to indicate sampling requirements was greatest in thunderstorms, rain showers and air mass storms. Conversely, minimum decay occurred with steady rain and the passage of low pressure centers. Seasonally, the decay rate is much greater in May-September storms than in cold season precipitation. Sampling requirements are extreme in measuring rainfall rates; thus, assuming a minimum acceptance of 75% explained variance between sampling points, a gage spacing of 0.3 minutes is needed for 1-minute rain rates compared with 7.5 minutes for total storm rainfall in summer storms.

7B. Data Acquisition

USE OF SIDE-LOOKING AIR-BORNE RADAR FOR SEA ICE IDENTIFICATION,
Coast Guard, Washington, D.C. Applied Sciences Div.
Jimmie D. Johnson, and Dennis L. Farmer.
Journal of Geophysical Research, Vol 76, No 9, p 2138-2155, March 20, 1971. 18 p, 14 fig, 4 ref.

Descriptors: *Remote sensing, *Radar, *Ice, *Sea ice, Arctic, Icebergs, Navigation, Freezing, Ice jams, Warning systems.
Identifiers: Side-looking radar.

An experiment was conducted to assess the performance of side-looking air-borne radar (SLAR) in mapping and identifying sea ice parameters. A Philco-Ford AN/DPD-2 (Modified) SLAR was installed on a Coast Guard C-130 aircraft and flown on an experimental basis during September 1969 in conjunction with the S.S. Manhattan's transit of the Northwest Passage. The SLAR was also used as a routing aid to the Manhattan. SLAR can readily be used to detect ice concentrations, floe size and number, and water openings, and to identify, through careful image interpretation, ice age, ice drift, surface topography, fractures, and pressure characteristics. SLAR's broad areal coverage, all weather day and night capability make it an effective means of observing sea ice, and for many purposes it provides observations superior to information obtained by a visual ice observer. SLAR imagery can be used in research efforts to study the formation, growth, and decay of sea ice and can be used operationally for ship routing and ice forecasting. (Knapp-USGS)

COMPARATIVE STUDY OF ELECTRICAL CONDUCTIVITY PROBES,
Iowa Univ., Iowa City. Iowa Inst. of Hydraulic Research.
Carlos V. Alonso.
Text in English and French. Journal of Hydraulic Research, Vol 9, No 1, p 1-10, 1971. 10 p, 5 fig, 1 tab, 8 ref. NSF Grant GK-2818; FWQA Grant WP-1218-01.

Descriptors: *Tracers, *Electrolytes, *Electrical conductance, *Instrumentation, Calibrations, Flow, Density, Tracking techniques, Conductivity, Water chemistry.
Identifiers: Electrical conductivity probes.

The use of conductivity probes for measuring fluid movement through the corresponding changes in the electrical conductivity of a tracer substance (aqueous sodium chloride solution) is considered. A comparative description is given of the characteristics of several conductivity probes of different sizes and configurations. In order to compare the response of the different types of probes, they were tested under the same experimental conditions. In addition, tests were conducted to determine how much influence, if any, the orientation of the probes has on the conductivity measurements, and, finally, their response times were evaluated. J. S. Summer, and R. E. West.
EOS (American Geophysical Union Trans) Vol 50, No 10, p 541-542, October 1969. 2 p, 3 fig, 5 ref. OWRR Project A-008-ARIZ (3).

Descriptors: *Gravity studies, *Surveys, Structural geology, Aquifers, Alluvium, Alluvial channels, Land subsidence, Water levels, Water table, Recharge, Groundwater movement, Mapping, Maps, Arizona, Water resources research act.
Identifiers: *Gravity surveys.

The Geophysics Laboratory at the University of Arizona has a continuing interest in making and analyzing gravity measurements over the state. Planning has started on compilation of an Arizona 1:500,000 scale gravity map to accompany the state geologic and magnetic maps. To date over 3000 gravity stations have been taken and com-

piled by the University of Arizona. Interpretation of gravity data for the purpose of determining subsurface structural conditions continues to be an important practical and academic subject in this region. In the Basin and Range province to the west, surveys are useful in outlining pediment edges obscured by alluvial cover, and in determining the depth of sedimentary alluvial basins. It is important to know where pediment edges are for purposes of exploration for minerals and groundwater. Also, pediment edges form a zone of soil instability because basin sediments subside with groundwater withdrawal. Another use of gravity measurements that is being developed is the technique of resurveying points established near occasional streams, for the purpose of learning about variations in subsurface water levels. Gravity differences can be related to differences in the amount of subsurface water caused by seasonal changes or nearby pumped wells. (Knapp-USGS)

DETERMINATION OF CARBONATE SATURATION OF SEAWATER WITH A CARBONATE SATUROMETER,
California Univ., Los Angeles, Dept. of Geology; and California Univ., Los Angeles. Inst. of Geophysics and Planetary Physics.
S. Ben-Yaakov, and I. R. Kaplan.
Limnology and Oceanography, Vol 14, No 6, p 874-882, November 1969. 9 p, 5 fig, 3 tab, 19 ref. USAEC Contract AT (11-1)-34, Project No 178.

Descriptors: *Water chemistry, *Carbonates, *Chemical potential, *Sea water, *Saturation, Equilibrium, Hydrogen ion concentration, Instrumentation, Calibration, Laboratory tests, On-site tests, Calcium carbonate, Chemical precipitation.
Identifiers: *Carbonate saturometers.

A mathematical model was established for the implementation of the Weyl saturometer, to obtain quantitative data on the degree of saturation of calcite and aragonite to within 2% when the chlorinity and pH of the measured seawater are known. The method also enables carbonate alkalinity to be estimated to within 10% of values obtained by titration. Nomograms are given for the determination of degree saturation and total CO2 for seawater of known pH, where a change in potential is measured after exposing a calibrated glass electrode to a slurry of calcium carbonate in the original seawater. THE DETECTION OF MAGNETIC FIELDS CAUSED BY GROUNDWATER AND THE CORRELATION OF SUCH FIELDS WITH WATER DOWSING,
Utah Water Research Lab., Logan.
Duane G. Chadwick, and Larry Jensen.
Available from NTIS as PB-198 343, $3.00 in paper copy, $0.95 in microfiche. Utah Water Research Laboratory Report PRWG 78-1, January 1971. 57 p, 27 fig, 8 tab, 9 ref, 2 append. OWRR Project B-033-UTAH (1). Matching Grant Agreement No. 14-31-0001-3133.

Descriptors: *Dowsing, *Groundwater, *Magnetic studies, *Water sources, Water wells, Statistical methods, Equipment, Test procedures.
Identifiers: *Water witching, *Dowsing techniques, Dowsing tests.

Perturbations on the earth's magnetic field may coincide with groundwater bodies; various geologic formations have differing magnetic signatures. Some of the formations are water bearing; some are not. The magnetic field perturbations were plotted and numerous independent, individual dowsing tests were made at 4 principal locations. Objective was to see if water dowsers (1) obtain results which are independently corroborative and (2) obtain results which correlate in some way with magnetic field plots of the dowsed areas. About 150 people participated in the experiment over a one year period. Chi-square tests show considerable statistical significance. Nearly all the people involved in the project experienced dowsing reactions though most had never dowsed before. Some evidence exists of correlation between magnetic gradient changes and dowsing reactions. Concern is expressed that this report may be used to prove dowsing is an effective means of finding water if certain statements are taken out of context. It is emphasized that no wells were dug, tests by a few experienced dowsers did not have results better than novices, and only by statistics was it shown that some kind of undefined information might be present. ON THE POSSIBILITY OF USING METEOROLOGICAL SATELLITE OBSERVATIONS FOR THE STUDY OF ANTARCTIC ICE,
P. Glade, H. Gernandt, and V. A. Shamont'yev.
Translated from Informatsionnyi Byulleten' Sovetskoi Antarticheskoi Ekspeditsii, No 73, p 27, 1969. Soviet Antarctic Expedition Information Bulletin, Vol 7, No 4, p 296-299, February 1971. 4 p, 3 fig, 3 ref.

Descriptors: *Aerial photography, *Antarctic, *Satellites (Artificial), Remote sensing, Ice, Glaciers, Coasts, Icebergs, Surveys, Mapping.
Identifiers: *Antarctic ice.

Meteorological satellite observations can aid in the study of antarctic ice. The photographs taken by the satellite from an altitude of about 1000 km depict areas of the earth's surface measuring approximately 2500 x 2500 km, and the scale of the photographs is close to 1:15,000,000. The satellite photographs clearly show the configuration of the coastline. Meteorological satellite observations show great promise for the study of antarctic ice. The information received from satellites is an additional source of data concerning the variations in the general position of the antarctic ice shore needed for the study of the mass balance of the Antarctic ice sheet. The recording of large icebergs on photographs over a long period of time will help refine their drift trajectories in antarctic waters. These data can be used for the observation of large accumulations of fast and drift ice off the coast of Antarctica. (Knapp-USGS)

7C. Evaluation, Processing and Publication

AN AUTOMATIC RECORDING FIELD STATION FOR COLLECTING ENVIRONMENTAL DATA,
Geological Survey, Arlington, Va.
Wallace M. Yater, Jr.
BioScience, Vol 21, No 1, p 11-15, January 1971. 5 p, 5 fig, 3 ref.

Descriptors: *Data collections, *Hydrology, *Remote sensing, *Automation, *Data transmission, Soil moisture, Rainfall, Temperature, Instrumentation, Electrical resistance, Methodology, Data processing, Data storage and retrieval, Computers, Equations, Computer programs.
Identifiers: Digital tape, Magnetic tape.

An automated system for recording soil moisture, rainfall, temperature, and microchanges in tree radius in several different type habitats is described. The data are punched on paper tape which can be transcribed to magnetic tape for computer use. All of the sensors were designed so that their electrical resistance would vary over all or part of a 0 to 41,000 ohm range. This matching of the resistance ranges of the sensors to the measuring circuit permits the same Wheatstone bridge circuit to measure all of the sensors. The same servo motor that balances the bridge simultaneously positions to digit cams of a Fischer and Porter digital recorder, which punches a four-digit binary decimal number in 16-channel paper tape at the end of the balancing cycle. A 6-volt battery drives the bridge balancing, primary step switch, and digital punch mechanism motors, while a 12-volt battery powers the transistor amplifier and the bridge and actuates the solenoids in the Leds secondary step switches. The system cost about $4800 in 1968. This includes the bridge servo, digital recorder, sensors (excepting dendrometer for the tree radius measurement), and payment to a private contractor to design and construct the bridge, switching system, instrument and battery shelters, and junction boxes. QUANTITATIVE SLOPE ASPECT DETERMINATION,
Agricultural Research Service, Beltsville, Md. Hydrograph Lab.
C. B. England.
Journal of Hydrology, Vol 12, No 3, p 262-268, February 1971. 7 p, 5 fig, 1 tab, 3 ref.

Descriptors: *Terrain analysis, *Mapping, *Slopes, *Topography, Small watersheds, Profiles, Surveys, Evapotranspiration, Maps, Geomorphology.
Identifiers: *Slope determination.

A rapid and efficient method is described for quantifying slope exposure using only a T-square and triangle on a topographic map. Results of aspect determination using this technique on a small Wisconsin watershed are compared with those obtained by point sampling. Since the proposed method accurately defines the boundaries between aspect units, and requires less than one-third the time, it has distinct advantages over point sampling, which can erroneously define the boundaries. Proposed use of this method is to derive aspect parameters for a watershed evapotranspiration model. (Knapp-USGS)

Identifiers: *Graph theory, *Baffin Island (Canada).

Some methods of examining the interrelationships among variables (R-mode) and among individual objects (Q-mode) require measurements on an interval or ratio scale, and are frequently not useful in many geomorphological studies where lower measuring scales are employed. By contrast, the information- and graph-theory methods use nominal scale data. Their use is illustrated by a discussion based on a 41 (objects) X 12 (variables) matrix relating to the cross-valley moraines of Baffin Island. The variables measure moraine shape, location, till fabrics, and clast roundness. The information-theoretic approach generates a measure of distance and computes the amount of shared information between the variables. Unconditional and conditional probability tables are used to assess the stochastic dependence among states of two variables. Graph-theoretic methods are used to develop a measure of similarity that is then used in a classification of the moraines. The characters that share most information are two measures of clast roundness and the dip pattern of till fabric. Two classifications are developed that share considerable information with moraine shape and location within the valley; 'hooked' and 'asymmetric' moraines were found to be quite different from each other. Since the techniques use nominal data, they should have general applicability in several fields of geology. (Knapp-USGS)

RECONNAISSANCE OF SELECTED MINOR ELEMENTS IN SURFACE WATERS OF THE UNITED STATES, OCTOBER 1970,
Geological Survey, Washington, D.C.
W. H. Durum, J. D. Hem, and S. G. Heidel.
Free on application to the US Geological Survey, Washington, DC 20242. Geological Survey Circular 643, 1971. 49 p, 6 fig, 1 tab, 3 ref.

Descriptors: *Trace elements, *Water analysis, *United States, *Puerto Rico, *Water chemistry, Sampling, Rivers, Lakes, Laboratory tests, Chemical analysis, Cobalt, Chromium, Data collections, Surface waters, Water supply, Natural streams, Industrial wastes, Municipal wastes.
Identifiers: *Mercury, Arsenic, Cadmium, Lead, Zinc.

A nationwide reconnaissance of selected minor elements in water resources of the 50 States and Puerto Rico was made by the U.S. Geological Survey in cooperation with the U.S. Bureau of Sport Fisheries and Wildlife during autumn, 1970. The more than 720 samples collected from rivers and lakes were analyzed for arsenic, cadmium, chromium (hexavalent), cobalt, lead, mercury, and zinc. A summary of the results for each element is given and analytical results are tabulated. Data on mercury are reported in two forms: dissolved and total. The concentration of the dissolved form is an indication of what might occur in a treated or filtered water supply at the same sampling point. Total mercury represents the amount in the water-sediment mixture. In none of the dissolved mercury samples did the concentration exceed the proposed Public Health Service upper limit for dissolved mercury in drinking water, which is 5 millionths gram per liter. Total mercury was found in excess of this concentration in a few instances. (Woodard-USGS)

SURFACE WATER SUPPLY OF THE UNITED STATES, 1961-65: PART 2. SOUTH ATLANTIC SLOPE AND EASTERN GULF OF MEXICO BASINS.
Geological Survey, Washington, D.C.

For sale by the Superintendent of Documents, US Government Printing Office, Washington, DC, 20402, as I19.13:1904, Price $4.25. Geological Survey Water-Supply Paper 1904, 1970. 942 p, 1 fig, 1 plate.

Descriptors: *Surface waters, *Streamflow, *Flow measurement, *Stream gages, *Gaging stations, Data collections, Flow rates, Average flow, Low flow, Peak discharge, Lakes, Reservoir stages.
Identifiers: *South Atlantic slope, *Eastern Gulf of Mexico basins, Stream discharge, Flow extremes, Crest stage.

This volume is one of a series of 37 reports presenting records of stage, discharge, and content of streams, lakes, and reservoirs in the United States during the 1961-65 water years. The data reported comprise a description of the gaging station, and tables showing the daily, monthly, and yearly discharges of the stream. The description of the station gives the location, drainage area, records available, type and history of gages, average discharge, extremes of discharge, and general remarks. For most gaging stations on lakes and reservoirs the data presented comprise a description of the station and a monthly summary table of stage and contents. Data for partial-record stations are presented in two tables. The first is a table of discharge measurements at low-flow partial-record stations, and the second is a table of annual maximum stage and discharge at crest-stage stations. (Woodard-USGS)

WATER TEMPERATURES OF CALIFORNIA STREAMS, NORTH COASTAL SUBREGION,
Geological Survey, Menlo Park, Calif.
J. C. Blodgett.
Geological Survey Open-file Report, July 6, 1970. 92 p, 4 fig, 1 tab, 24 ref.

Descriptors: *Water temperature, *Streams, *Data collections, *Hydrologic data, *California, Fluctuation, Average flow, Gaging stations, Thermometers, On-site data collections, Frequency.
Identifiers: *Northwestern California, Thermograph stations, Daily measurements.

A summary of water-temperature records is presented for data collected through September 1968 in the North Coastal Subregion of California. This report is one of a series covering the 11 hydrologic subregions of the State and includes data for 120 stream sites. Water temperatures, in degrees Celsius, are summarized by months, years, and for the period of record. A description is included to identify each station where data were collected. A tolerance interval analysis indicates that 99 percent of the point water-temperature observations, determined either with thermograph probes or hand-held thermometers, should be within 1.1 deg F of the mean water temperature at the 95-percent confidence level. The summary data for each site may be used to provide guidelines for the establishment of thermal standards used in water-quality management. (Woodard-USGS)

FINITE ELEMENT SOLUTION OF STEADY STATE POTENTIAL FLOW PROBLEMS--THE HYDROLOGIC ENGINEERING CENTER GENERALIZED COMPUTER PROGRAM 723-G2-L2440.
Corps of Engineers, Davis, Calif. Hydrologic Engineering Center.

Army Corps of Engineers Hydrologic Engineering Center Report, November 1970. 48 p, 22 fig, 3 tab, 22 ref, 5 append.

Descriptors: *Model studies, *Groundwater movement, *Steady flow, *Potential flow, *Computer programs, Porous media, Mathematical models, Equations, Data storage and retrieval, Programming languages, Darcys law, Hydrogeology, Hydraulics, Hydraulic conductivity, Flow characteristics, Boundaries (Surfaces), Pressure, Dynamics, Velocity, Hydraulic gradient.

This computer program is intended for application to problems involving steady, two-dimensional or axisymmetric flow through heterogeneous, anisotropic porous media of virtually any internal or external geometry. Although the program was developed primarily with groundwater and seepage problems in mind, it is equally applicable to potential flow problems of any type, such as those involving heat conduction or electric potential distribution. The basic equations that are solved numerically by the finite element method are derived on the basis of a number of assumptions as to the physics of motion and achievement of continuity of mass. These equations include the differential form of Darcy's Law, the continuity equation, and derived basic flow equations. This program uses the finite element numerical method to solve second order, linear partial differential equations, and associated boundary conditions. The program as dimensioned can handle up to 400 nodes, 400 elements, 20 conductivity zones, 100 specified nodal values of potential, 200 sources or sinks and 100 known-flow boundaries. It occupies about 31,000 words of core on a CDC 6600 computer. Each input card is described in detail, and a summary of input cards is included. (Woodard-USGS)
W71-06701

HYDROLOGY ANNUAL NO 14 - 1966.
Soil Conserv and Rivers Control Council Annual Hydrol Rep, 1968. 247 p, 5 fig, 19 ref.

Descriptors: *Data collections, *Hydrologic data, *Bibliographies, Streamflow, Stream gages, Snow surveys, Snow cover, Low flow, Floods, Discharge (Water), Recession curves, Sediment load, Suspended load, Water quality, Channel morphology, State-discharge relations.
Identifiers: *New Zealand.

Hydrologic data collected at 25 stations in New Zealand in 1966 are tabulated. Collected data include a list of streamflow stations, precipitation gages, sediment gages, water quality stations, snow courses, groundwater observation sites, representative and experimental basins, streamflow tables, snow survey data, recession curves, suspended sediment rating curves, water quality data, flood data, and channel morphology and efficiency surveys. An annotated bibliography of hydrological papers about New Zealand and by New Zealand authors is included. Addresses of all local hydrological and meteorological authorities and agencies collecting data are also included.

A SHORTCUT FOR COMPUTING STREAM DEPLETION BY WELLS USING ANALOG OR DIGITAL MODELS,
Geological Survey, Denver, Colo.
O. James Taylor.
Groundwater, Vol 9, No 2, p 9-11, March-April 1971. 3 p, 2 fig, 2 tab, 4 ref.

Descriptors: *Surface-groundwater relationships, *Mathematical models, *Computer programs, *Analog models, Simulation analysis, Withdrawal, Drawdown, Recharge, Aquifers, Hydrogeology, Aquicludes, Alluvial channels.
Identifiers: Alluvial aquifers.

Theory indicates that the effect of a discharging well on streamflow in a stream-aquifer system is independent of the length of the reach. The theory was verified using a digital computer model of short and long reaches of a stream-aquifer system. The theory was extended successfully to a heterogeneous stream-aquifer system having sinuous boundaries where the stream was reasonably straight. Within tested limits, a model of a short reach will give results comparable in accuracy to one of a long reach with considerably less effort and expense. (Knapp-USGS)

HANDBOOK OF STEEL DRAINAGE HIGHWAY CONSTRUCTION PRODUCTS.

Am Iron Steel Inst, New York, NY, 1967. 382

Descriptors: *Drainage, *Construction, *D data, *Design, *Steel, *Steel structures, *Ins tion, *Application methods, Construction m als, Construction equipment.

The main purpose of this handbook is to ai gineers in overcoming problems involve highway, railway, municipal, agricultural, ar dustrial drainage and construction. The text ai present engineering practices based on sixty of practical experience compatible with ex technology. Design data and designed aids are extensively, while theory is kept at a minimum design and application of flexible steel derground conduits, plus good installation tices, are described in the first two parts o book. The third part concerns other steel pro for related construction. The first part on ge design considerations includes chapters product details, strength design, service hydraulics, cost factors, couplings and fittings installation instructions. Part II on applic covers the following subjects: culverts, sewers drainage, airport drainage, erosion preve dam and levee drainage, tunnels, shafts, cai underpasses, and service tunnels. The book contains a glossary of terms, a list of symbols version tables, general tables, and gage/heig cover tables. (See also W71-06640 thru 06648)

HANDBOOK OF STEEL DRAINAGE HIGHWAY CONSTRUCTION: CHAPTER PRODUCT DETAILS.
Am Iron Steel Inst, New York, NY, p 10-37, 14 fig, 22 tab, 14 ref.

Descriptors: *Underground structures, *Con *Steel, *Analysis, Steel structures, Design, St drainage, Subsurface drainage, Bypasses.
Identifiers: Storm sewers.

This chapter studies product details involv design of flexible steel underground con Design factors are listed, and the book ele begin with an analysis of the required strengt tor of the conduit wall. The background of gated steel conduits is given as well as spe tions in common use; a description of corruga sectional properties, pipe seams, and shapes o duits; data on structural plates that are field a bled, and on bolts and nuts, and arch channel following three principal types of undergoun duits are introduced: (1) conduits for s drainage, such as culverts, storm sewers stream enclosures; (2) conduits for subdraina controlling underground water; and (3) co for traffic underpasses, and service passes. also W71-06639)
W71-06640

HANDBOOK OF STEEL DRAINAGE HIGHWAY CONSTRUCTION: CHAPTER STRENGTH DESIGN.
American Iron and Steel Inst., New York.

Am Iron Steel Inst, New York, NY, p 38-63, 18 fig, 5 tab.

Descriptors: *Design, *Underground structures, *Design criteria, *Strength of materials, Design data, Operation and maintenance.

Design methods discussed in this chapter are based on more than sixty years satisfactory field experience with buried flexible structures. The new design approach explained considers overall needs of the drainage structure--environment, service demands, and strength requirements under dead and live loads. Computer analysis is practical and is an anticipated future development when sufficient research evaluates the influence of different soils and compactions on the structure. The following topics are treated in the chapter in the same sequence in which decisions are made in designing buried structures: (1) computation of loads; (2) culvert structural design; (3) earth backfill design; (4) foundation preparation; (5) minimum cover; (6) end treatment; and (7) maintenance. HANDBOOK OF STEEL DRAINAGE CONSTRUCTION PRODUCTS: CHAPTER 15 - COST FACTOR.

Am Iron Steel Inst, New York, NY, p 142-150, 1967. 5 fig, 4 tab, 4 ref.

Descriptors: *Maintenance costs, *Cost analysis, Cost trends, *Cost comparisons, Costs, Economic prediction.

Cost per year of service depends on durability, maintenance, ease of replacement, and factors influenced by local conditions. Recent trends show an increase in pre-engineered and prefabricated structures with consequent reduction of on-the-job labor. This has the following three-way effect: (1) promotes factory-controlled quality under more ideal working conditions; (2) by reducing design and inspection time, it permits the engineer to concentrate on the whole job rather than its details; and (3) although product cost may be higher, installed cost is usually less. Subsections of this chapter discuss: (1) price vs. cost; (2) cost items included; (3) material cost; (4) hauling and handling; (5) excavation and backfill; (6) installation; (7) replacing the traffic surface; (8) detours, slow orders; (9) supervision, overhead contingencies insurance; (10) engineering costs; (11) unstable foundation conditions; and (12) the cost end of treatment. (See also W71-06639)
W71-06644

HANDBOOK OF STEEL DRAINAGE AND HIGHWAY CONSTRUCTION PRODUCTS: CHAPTER 6 - COUPLINGS AND FITTINGS.
Am Iron Steel Inst, New York, NY, p 151-159, 1967. 16 fig.

Descriptors: *Steel pipes, Joints (Connections), Installation, Design data.
Identifiers: *Couplings.

Shop-fabricated corrugated steel pipe and pipe-arches are delivered in lengths convenient for shipping and handling. For longer installed lengths, standard connecting bands or special field joints are used. Joint selection criteria covered in this chapter include strength, joint tightness, simplicity, and economy of installation. Also treated are design features of couplings, standard and special fittings, fabrication details, and field installation of fittings. (See also W71-06639)
W71-06645

HANDBOOK OF STEEL DRAINAGE AND HIGHWAY CONSTRUCTION PRODUCTS: CHAPTER 9 - SEWERS.

Am Iron Steel Inst, New York, NY, p 202-211, 1967. 9 fig, 4 ref.

Descriptors: *Sewers, *Design standards, *Treatment facilities, Sewerage, Steel, Equipment, Control systems, Control structures.
Identifiers: *Sewer design, Steel structures, Storm sewers, Combined sewers, Sanitary sewers.

This chapter defines terminology associated with sewers and sewerage and explains basics involved in the following areas: sewer system design, corrugated steel sewers, storm sewer inlets, standard and special fittings, manholes, sewers joints and outfalls, sewage treatment plants and lagoons, septic tanks, water control gates, and sewer maintenance and repair. Definitions include: sewer, sewage, storm sewer, sanitary sewer, combined sewer, industrial wastes, half-soling, threading, and tunneling. (See also W71-06639)
W71-06647

HANDBOOK OF STEEL DRAINAGE AND HIGHWAY CONSTRUCTION PRODUCTS: CHAPTER 11 - AIRPORT DRAINAGE.

Am Iron Steel Inst, New York, NY, p 240-247, 1967. 4 fig, 2 tab, 4 ref.

Descriptors: *Surface runoff, *Drainage systems, *Controlled drainage, *Design standards, *Standards, *Drainage practices, *Rainfall-runoff relationships.
Identifiers: *Airport drainage.

The purpose of airport drainage is to remove water which may hinder any activity necessary for the safe and efficient operation of the airport. Artificial facilities are needed to collect surface runoff, dispose of excess groundwater, lower the water table, and protect slopes. Characteristics of airport drainage are summarized, and a list is presented of information needed prior to designing the drainage system. Requirements of airport drainage differ from those of culverts, storm drains, and subdrainage of highways, railways, industrial areas, agricultural, urban, and suburban areas; and these differences are reviewed, especially in regard to rainfall-runoff computations. Four types of drainage appearing on airports are mentioned, and Federal Aviation Agency recommended standards are listed. Remaining sections of the chapter concern the size of conduits, the selection structures, and storm drains. (See also W71-06639)
W71-06648

EARTHQUAKE RESPONSE OF ARCH DAMS,
Assam Engineering Coll., Gauhati (India); and Southampton Univ. (England).
U. C. Tahbilder, and H. Tottenham.
Proceedings American Society of Civil Engineers, Journal of the Structure Division, Vol 96, No ST11, p 2321-2336, Nov 1970. 16 p, 13 fig, 23 ref, 2 append.

Descriptors: Damping, Dams, Dam design, *Arch dams, *Dynamic response, Concrete dams, Deformation, *Earthquakes, *Finite element method, Stress analysis, Dynamic loads, Earthquake loads, Structural behavior, Computer applications, Stress, Analytical techniques, Acceleration (Physics), Seismic design, Displacements, Bibliographies, Foreign research.
Identifiers: Great Britain.

A theoretical assessment of dynamic response of arch dams caused by earthquakes is attempted using the finite element shell formulation. Results of the analysis reveal that seismic forces can induce high tensile stresses in arch dams, and should be given serious consideration in seismic-resistant design. The dam is idealized as an assemblage of rectangular elements with consistent mass distribution and viscous damping. The reservoir is taken into account by considering the added mass. Response to ground accelerations is evaluated by step-by-step integration of governing differential equations assuming a certain variation of dam acceleration within a short time interval. The method is stable and provides greater economy in computing time than the normal mode method. Response for a particular dam is obtained for 3 earthquakes: El Centro, May 18, 1940; Santa Barbara, June 30, 1941; and Taft, July 21, 1952. (USBR)
W71-06843

LOWESTOFT CHOOSES TUNNEL FOR SEWAGE OUTFALL.

Surveyor, Vol 84, No 4030, p 18, Aug 29, 1969. 2 fig.

Descriptors: *Outlets, *Sewerage, *Construction, *Currents (Water), *Cost, *Tunnel design, Discharge (Water), Sewage treatment, Tunnel construction, Tunneling machines, Waste disposal.

The sewage outfall project at Lowestoft is controversial in concept as well as in mode of construction. Problems of such outfalls include their frequent damage by heavy seas and their questionable ability to adequately disperse effluents. Sea currents at discharge points were investigated and found to be conducive to properly carrying effluent out to sea. The slightest beach pollution, however, will promote intense public distrust of the plan. Discharge shafts of the tunnel beneath the sea-bed will be raised through the use of massive hydraulic jacks, and unusual technique. Both the tunnel work and the shaft raising will be done employing compressed air. Dimensions of the tunnel and other construction techniques and problems are related. The scheme adopted is inexpensive with regard to capital and service costs. A complete sewage treatment works for the town would cost at least twice as much.

WATER WELL HANDBOOK,
Missouri Water Well and Pump Contractors Association, Rolla, Mo.
Keith E. Anderson.
St. Louis, Scholin Brothers Printing Corp, Second Edition, 1967. 281 p.

Descriptors: *Water wells, *Drilling, Rotary, Water quality, Casing, Well hydraulics, Drilling equipment.
Identifiers: *Cable tool drilling, Pumps, Flow measurement, Mathematical formuli and conversion tables, Electrical data.

Drillers, engineers, and geologists working with water wells have occasion to refer frequently to charts, tables and other data which are scattered throughout many books and catalogs. At present,

there has been no convenient reference source available which brings much of this information together. This booklet has been prepared for that purpose. An attempt has been made to bring together only the information most frequently referenced to by persons working with groundwater supplies. It is well indexed to assure usability. (Campbell-NWWA)

CABLE TOOL FISHING,
Water Well Journal Publishing Co., Urbana, Ill.
M. G. Decker.
Urbana, Water Well Journal Publishing Co, 1968. 70 p.

Descriptors: *Drilling, *Water wells, Drilling equipment, Oil industry, Groundwater.
Identifiers: *Cable-tool drilling, Fishing string, Sockets, Casing problems, Latch jacks, Whip stocks.

Drilling cables and sand lines should be watched carefully for signs of weakness or unusual wear; drilling tools should be inspected for fatigue cracks, particularly at welds; tool joints should be returned at regular periods; and no equipment or tools should be lowered into the well unless, as far as can be detected, they are in perfect condition. Fishing is the cause of annoying delays and financial loss in drilling operations. Therefore, it is essential to take every precaution with drilling tools, and to exercise care in drilling, in order to avoid as many fishing jobs as possible. However, in anticipation of the inevitable fishing job, it is a good plan to record the exact dimensions of everything used about, or in, the well so that information will be at hand for designing or selecting a suitable fishing tool. Any work being done in the drilling, cleaning out, or servicing of a gas, oil, or water well involves the risk of (1) failure of the drilling tools or the casing, or (2) erroneous procedure - either of which may result in a fishing job. Thus the hazards of fishing are frequently the cause of high drilling costs. (Campbell-NWWA)
W71-06921

GROUNDWATER PRODUCTION FROM THE BEDROCK OF SWEDEN,
Craelius Terratest AB, Stockholm (Sweden). Geological Dept.
Martin G. Beyer.
Proceedings of the International Symposium, Stockholm, October 1966, Published by Pergamon Press, Chapter 10, p 161-179, 1968.

Descriptors: *Drilling, *Water wells, Groundwater, *Sweden, Igneous rock, Metamorphic rock.
Identifiers: *Air drilling, *Cable tool drilling, Precambrian aquifers, Seismic profiles, Municipal water supply, Well locations.

The ever-increasing fresh water quantities needed for the supply of growing communities recreation areas and industries in Sweden has greatly increased the amount of water drawn from the mainly Precambrian bedrock. Drilling methods by compressed air now being introduced are many times more efficient than conventional cable tool drilling. Increased output and closer spacing of wells, however, demand closer over-all control of bedrock groundwater resources. (Campbell-NWWA)

WAVE ABSORBERS IN HARBORS,
National Engineering Science Co., Pasadena, Calif.
Bernard Le Mehaute.
Available from NTIS as AD-704 721, $3.00 in paper copy, $0.95 in microfiche. Waterways Experiment Station Contract Report CR 2-122, June 1965. 124 p. Contract DA-22-079-CIVENG-64-81.

Descriptors: *Waves, *Energy transfer, *Harbors, *Breakwaters, Absorption, Mathematical models, Beach erosion, Seiches.
Identifiers: *Wave absorbers.

It is the purpose of this report to analyze the effect of wave absorbers on harbor agitation. A critical analysis of the previous studies on wave absorbers is presented. Then an attempt is made to improve the state of the art in the design of wave absorbers and in particular of rubble mound wave absorbers. A study on scale effects of wave absorbers built in scale models for studying wave agitation in harbors is also presented. Aside of the literature survey and general considerations on wave absorbers, a number of new theories have been developed and presented within this report.

MODERN WATER WELL DRILLING TECHNIQUES IN USE IN THE UNITED KINGDOM,
Stow and Co., Ltd., Henley (England).
G. R. S. Stow.
Groundwater, Vol 1, No 3, p 3-12, July 1963.

Descriptors: *Water wells, *Drilling, *England, Rotary drilling, Well development, Screens, Acids.
Identifiers: *Cable tool drilling, Chilled shot core drilling, Mud flush rotary drilling, Reverse circulation rotary drilling, Vertical deflexion, Well restoration, Television inspection.

The paper describes the main water-well drilling systems used in the United Kingdom, with some details of the tools used and the principles of operation. Limitations as regards diameter and depth for various systems and their suitability for drilling different strata are discussed. The materials customarily employed for lining wells and for making sand screens are mentioned. The usual method of measuring the deflexion from the vertical is outlined. Methods of developing or improving the yields of wells, and inspections by television cameras are described. There is no universal economic drilling system. Particularly on repetition work it is important to use the system appropriate to the site conditions. The most interesting developments of late have been (1) reversed-circulation rotary drilling for soft unstable sediments and for hard rocks and (2) the use of air circulation instead of mud for drilling hard stable formations at relatively small diameters. Development of wells by acidizing and other means to improve the yield is worth more consideration. Many of the water-well drilling techniques are applicable to and have been used for bored piles and caissons. (Campbell-NWWA)

PROGRESS IN THE WATER WELL CONSTRUCTION INDUSTRY,
Western Well Drilling Co., San Jose, Calif.
S. T. Guardino.
Groundwater, Vol 2, No 1, p 31-34, January 1964.

Descriptors: *Water wells, *Drilling, Rotary drilling, Standards.
Identifiers: Water well design, *Water well industry, Test bore drilling.

The modern water well contractor is a combination structural engineer, mechanic, geologist and sanitarian. Contractor's skills and accumulated knowledge should be assembled within an area and used as the basis for design and water well specifications. Engineering a water well should have the primary objective of obtaining and adequate supply of potable water, with equal importance placed upon the protection of the source of supply. The drilling of a test bore should be included in the design of every water well. A properly drilled and accurately logged test bore can determine exact design features and equipment requirements. In an area where formation samples may be deceiving and where a more accurate log is required, it is possible to contract for an electric log of the test bore. When it is essential to obtain truly representative samples in an uncontaminated form, core samples may be taken as the test bore is being drilled. The water well driller should acquaint his customer with modern construction procedures and modern water well design just as he has become aware of building codes and architectural specifications in the construction of buildings and homes. Contractors must keep pace with the achievements of technical people associated with the water well industry by self-education and incentive. The water well industry should be, and is, proud of its responsibility. (Campbell-NWWA)

WELL DRILLING MANUAL.
Koehring Co., Enid, Okla. Speedstar Div.

Enid, Oklahoma, Koehring, 1966. 72 p.

Descriptors: *Drilling, *Water wells, Drilling equipment, Wells, Water supply, Groundwater, Estimated costs, Operations and maintenance.
Identifiers: Cable tool rigs, Rotary rigs, Reverse circulation drilling, Lost circulation, Fishing tools, Drill string, Rig maintenance, Bits.

This manual is a basic 'how-to-do-it' book in the sense that it goes through a step-by-step discussion of how each of the various types of water well drills operators: step-by-step procedures are discussed on how to drill a hole with each type of equipment in use. Basic fishing tools and fishing techniques for drilling tools 'lost' downhole are also explored. Because of varying geological conditions and varying needs, it is difficult to choose the best equipment to do the job. This manual can assist government and private users in the selection of the proper drilling machines. (Campbell-NWWA)

MANUAL OF WATER WELL CONSTRUCTION PRACTICES.
Oregon Drilling Association, Inc., Portland.

Portland, Spencer Etzel Enterprises, 1968. 85 p.

Descriptors: *Drilling, *Water wells, Rotary drilling, Hydrology, Oregon, Wells, Drilling equipment, Casings, Groundwater.
Identifiers: *Water well location, Geologic considerations, Safety, Cable tool construction techniques, Bailers, Grouting, Well disinfection, Well completions.

The first purpose of this Manual is to introduce young drillers to the natural resource with which they will be dealing, to the earth's crust in which water is found, to the machinery and tools drillers employ, to the practicable and permissible techniques of drilling and to the terminology of the trade. The second purpose of the Manual is to suggest sources where answers may be found to the questions likely to be encountered in Oregon's State Examination for a Drilling Machine Operator's license and a Drilling Contractor's license. It is an attempt to bridge the gulf between age and youth, age-old methods and techniques as new as tomorrow. It is well referenced and contains many useful tables and graphs. (Campbell-NWWA)

EFFECT OF RESEARCH ON PRESENT DRILLING COSTS,
American Association of Oil Well Drilling Contractors, Dallas, Tex.
J. W. Peret.
Fourth and Fifth Annual Rotary Drilling Conference, Houston, Texas; Transactions and Minutes of the AAODC Rotary Drilling Committee for 1966-67, p 39-52. 12 tab, 24 fig.

Descriptors: *Drilling, *Drilling research, Oil industry, Rotary drilling, Drilling equipment.
Identifiers: *Drilling costs (Oil), Footage trend, Rig trend, Rig penetration trend, Average footage costs.

The objective in this study is to present the various trends that have developed in drilling along with

measurement of the money involved. The basic factors used include the Footage Penetrated, Holes Drilled, and Rigs Used. The scope of the study covers the USA for a period of 10 years, through 1965. The trend of footage drilled has been downward, dropping from 233.9 million feet in 1956 to 181.4 million feet in 1965. The above figures, as reported to industry, include both Rotary and Cable Tool drilling. The net Rotary drilled footage for the same years is estimated to have ranged from 192.3 million feet 1955 down to 154.2 million feet 1965. This marked decline of 20% drop in domestic rotary drilled footage is one of the reasons accounting for the current oversupply of rigs available for hire. The trend of rigs has lowered from 2,683 in 1955 down to 1,384 for 1965. The trend of average footage penetrated annually per rig has improved. In 1955 the rigs on Rotating Status averaged 71,684 feet per year each while in 1965 this figure had risen to 111,424 feet per rig. This impressive rising trend of penetration capability was achieved through gains in technology. An incomplete list of these innovations includes improvements in Weight-Speed programs; Hydraulics; muds low in viscosity, density and solids; better design and metallurgy in drill strings, bits, pumps, and rotary connections; better practices in inspection, classification and grading of used drill strings and bits; along with many other advancements. PRESENT STATUS OF DRILLING RESEARCH,
American Association of Oil Well Drilling Contractors, Dallas, Tex.
Stanley Hutchison.
Fourth and Fifth Annual Rotary Drilling Conference, Houston, Texas; Transactions and Minutes of the AAODC Rotary Drilling Committee for 1966-67, p 34-38. 2 tab, 2 ref.

Descriptors: *Drilling, *Oil industry, Rotary drilling, Drilling fluids, Cementing.
Identifiers: *Drilling Research, Present field situation, Areas for drilling research, Incentives for drilling research, Data capture and retrieval, Rig automation, Drilling economics.

A survey of drilling research on a reconnaissance basis has recently been completed which had the major objectives of determining what was required to make progress in drilling, if there was an economically fruitful field for drilling research and development, and how this drilling research and development could best be accomplished. There was a consensus of opinion that is unlikely that new and exotic hole-forming methods and techniques will replace the rotary drilling method in the foreseeable future. Therefore, the greatest potential is in drilling as well as we already know how, and in making incremental improvements in rotary drilling methods. A number of ideas appear to offer economic research and development opportunities. It is doubtful the present level of drilling research and development will fulfill the oil industry's requirements. The operators who have continuous drilling programs have the major economic incentives for supporting an active drilling research program. Cooperative drilling research efforts are highly desirable in order to reduce the costs and spread the risk of an individual operator. (Campbell-NWWA)

ANALYSIS OF EXPERIMENTS ON SECONDARY UNDULATIONS CAUSED BY SURGE WAVES IN TRAPEZOIDAL CHANNELS,
Societe Grenobloise d'Etude et d'Applications Hydrauliques (France).
F. Benet, and J. A. Cunge.
Text in English and French. Journal of Hydraulic Research, Vol 9, No 1, p 11-33, 1971. 23 p, 5 fig, 1 tab, 10 ref, 4 append.

Descriptors: *Hydraulic jump, *Surges, *Waves (Water), *Unsteady flow, *Open channel flow, Open channels, Hydraulic models, Hydraulics, Turbulent flow.
Identifiers: *Open channel surges, Trapezoidal open channels.

Secondary undulations, referred to sometimes as Favre waves, are associated with surge waves in canals. In most practical cases, the amplitude of the undulations superimposed upon the surge is at a maximum near the banks. Both laboratory and field observations illustrate the two-dimensional nature of Favre waves. There is a considerable difference between the maximum water level fluctuations at the channel edges and at the center of the cross-section and, therefore, the water surface in a cross-section cannot be assumed to be horizontal. Two phenomena seem to be superimposed: Wave propagation in water of varying depth, with the wave amplitude depending on the energy which should have been dissipated by the jump; and a phenomenon depending on the initial velocity. (Knapp-USGS)

TURBULENCE CHARACTERISTICS IN FREE SURFACE FLOWS OVER SMOOTH AND ROUGH BOUNDARIES,
State Univ. of New York, Buffalo; and Florida Univ., Gainesville. Dept. of Coastal and Oceanographic Engineering.
Paul H. Blinco, and E. Partheniades.
Text in English and French. Journal of Hydraulic Research, Vol 9, No 1, p 43-71, 1971. 29 p, 9 fig, 2 tab, 15 ref.

Descriptors: *Turbulence, *Open channel flow, *Boundary layers, *Turbulent boundary layers, *Roughness (Hydraulic), Turbulent flow, Erosion, Scour, Model studies, Hydraulic models, Reynolds number, Free surfaces.
Identifiers: Free surface flow.

The effects of boundary roughness and Reynolds number on the turbulence intensity in the direction of the flow were determined in an open channel flume. The results of this study suggest the possibility of using a universal equation relating turbulence intensities to boundary shear, kinematic viscosity and relative distance from the boundary. The relative turbulence intensity in the direction of flow with respect to the shear velocity seems to depend exclusively on the dimensionless distance from the boundary, which may be interpreted as a frictional Reynolds number. The relative intensity as a function of relative distance increases strongly with increasing bed roughness. (Knapp-USGS)

VELOCITY DISTRIBUTIONS IN WIDE, CURVED OPEN-CHANNEL FLOWS,
Imperial Coll. of Science and Technology, London (England). Dept. of Hydraulic Engineering; and Aleppo Univ. (Syria). Dept. of Engineering.
J. R. D. Francis, and A. F. Asfari.
Text in English and French. Journal of Hydraulic Research, Vol 9, No 1, p 73-90, 1971. 18 p, 6 fig, 8 ref.

Descriptors: *Vortices, *Turbulent flow, *Open channel flow, *Meanders, *Hydraulic models, Eddies, Mixing, Hydraulics, Flumes, Boundary layers, Open channels, Velocity, Currents (Water).
Identifiers: Secondary flows.

Bends in rivers give rise to a spiral flow which gradually brings slow fluid originally near the bed to other positions in the cross-section. In an experimental investigation of secondary currents in sharp bends of relatively wide streams, measurements were taken of the tangential velocity at several cross-sections. The bends were of 180 deg deflection and were of rectangular section. The general equations of motion were solved using the method of finite differences. The calculation is based upon a simple model which ignores the complexities of slow spiral flows, and merely relies on the mixing that is induced by the non-uniform flow in the fluid entering the bend. (Knapp-USGS)
W71-06481

CONCEPT OF CRITICAL SHEAR STRESS IN LOOSE BOUNDARY OPEN CHANNELS,
West Virginia Inst. of Tech., Montgomery. Dept. of Civil Engineering.
A. S. Paintal.
Text in English and French. Journal of Hydraulic Research, Vol 9, No 1, p 91-113, 1971. 23 p, 9 fig, 2 tab, 12 ref, append.

Descriptors: *Reviews, *Hydraulic models, *Sediment transport, *Alluvial channels, *Bed load, Scour, Stream erosion, Shear stress, Erosion, Streamflow.
Identifiers: Critical shear stress (Scour).

The problem of defining critical flow condition associated with the initial instability of bed material particles was reviewed in relation to existing concepts. A distinct condition for the beginning of movement does not really exist, but for all practical purposes, a limiting bed shear stress for a bed material can be defined below the bed load transport is of no practical importance. A family of curves can be fitted into the data which show that the bed load transport rate varies as the 16th power of bed shear stress. This 16th power correlation is consistent with that concept of critical shear stress which stipulates that a small increase in bed shear stress causes a noticeable change in bed load transport. For the professional engineer, the concept of critical shear stress or limiting shear stress is very useful, since it indicates the flow under which a natural or an artificial bed will be stable. DEVELOPMENT OF A MEANDERING THALWEG IN A STRAIGHT, ERODIBLE LABORATORY CHANNEL,
Geological Survey of Israel, Jerusalem.
Iaakov Karcz.
Journal of Geology, Vol 79, No 2, p 234-240, March 1971. 7 p, 6 fig, 21 ref.

Descriptors: *Channel morphology, *Scour, *Sedimentary structures, *Alluvial channels, *Hydraulic models, Model studies, Flumes, Dunes, Meanders, Braiding, Sediment transport, Bed load.
Identifiers: Flume models.

A preliminary, experimental study was made of the development of a meandering stream path in a straight erodible channel. Emphasis was on the visual rather than quantitative aspects of the bed deformation process. The following sequence of bed deformation leading to a development of a

meandering stream path was observed in shallow flows along a straight laboratory channel molded in pumice: (1) appearance of far-spaced bed undulations; (2) appearance of flow-aligned scours at the leeward ends of the undulation crests; (3) growth and spread of the scours and a gradual deformation of the surrounding stream bed into a thatched at offset pattern of scours with intervening mounds; (4) growth and merging of scours along interconnecting sinuous paths; (5) rapid excavation along a preferred tortuous path and appearance of a pronounced meandering thalweg. These events may be interpreted as results of the inherent structure of the parent flow. (Knapp-USGS)

BLOCKING EFFECTS IN FLOW OVER OBSTACLES,
Johns Hopkins Univ., Baltimore, Md. Dept. of Mechanics.
Robert R. Long.
Tellus, Vol 22, No 5, p 471-480, 1970. 10 p, 11 fig, 11 ref. ESSA Grant No E22-15-69 (G).

Descriptors: *Stratified flow, *Unsteady flow, *Flow around objects, *Deflection, Diversion, Eddies, Backwater, Hydraulic jump, Bores, Surges, Non-uniform flow, Vortices, Turbulent flow, Hydraulics, Air circulation, Winds.
Identifiers: Blocking effect (Stratified flow).

A theoretical investigation is made of the flow of two fluids over an obstacle. Particular attention is given to the upstream disturbance that occurs when the obstacle is started up from rest in a long channel. This has importance as it relates to the blocking phenomenon that occurs when a stratified fluid like the atmosphere moves over barriers. The results of the analysis are borne out by the experiments in the special case of disturbances at a water-air interface. The blocking that occurs is accomplished by a bore moving up ahead of the obstacle raising the upstream depth. The phenomenon is unsteady; it is also non-linear as indicated by the fact that the upstream may be disturbed even when conditions permit no infinitesimal disturbance to progress upstream. RACE TO PLUG BURST MAIN BEFORE RAINS CAME.

Eng Contract Record, Vol 82, No 12, p 44-45, Dec 1969.

Descriptors: *Damages, *Remedies, *Repairing, Estimated costs.
Identifiers: *Storm sewers.

The article describes how a municipal storm sewer section, solidly plugged with a mixture of mud and water, ruptured and was repaired. Three steps were taken to correct the damage: (1) temporary lines were laid along the surface and the mains were pumped through these surface lines; (2) drop manholes were constructed at two sides of the threatened area; and, (3) three pumps were used to by-pass the plugged section of the line. The emergency measures for the public are related, and the theoretical causes for the break are included. The cost of repair for this unexplained occurrence is given.

MODEL STUDIES OF STORM SEWER DROP SHAFTS,
Sigurd H. Anderson.
St Anthony Falls Hydraulic Laboratory, Minneapolis, Technical Paper No 35, Series B, p 1-61, Dec 1961.

Descriptors: *Hydraulic structures, *Laboratories, *Model studies.
Identifiers: *Drop shafts, *Storm sewers.

The Department of Public Works of the City of St. Paul, Minnesota, presently engaged in a program of enlarging their storm sewer system, is developing a drop-shaft design which will reduce the possibility of impact damage to the structure and also insure stable flow conditions in the underground interceptors. It was found that past designs required frequent inspection and maintenance at the base of the shaft to prevent failure of the structure. An experimental study led to the development of an impact-cup type of drop structure which could be effectively used to convey storm runoff waters from the surface to subterranean collecting systems with a minimum of air entrainment and a reduction in possible damage at the base of the drop. Pictures and measured sketches of the designs are included.

SOME ASPECTS OF DEEP SEWER MAINTENANCE,
L. Goodhew.
Water Pollution Control, Vol 68, No 2, p 217-221, Mar 1969.

Descriptors: *Sewers, Weirs.
Identifiers: *Storm sewage, *Deep sewers.

The design and construction of deep sewers which are described are drawn from the Rochester, Chatham and Gillingham Joint Sewerage Board. It is advised to restrict the admission of storm sewage and to install storm overflow weirs only on the branch sewers. The maintenance of deep sewers as well as safety precautions, and cleaning and inspection methods are explained. For the first flush of storm sewage into the trunk sewer, a long and narrow chamber, with an overflow weir at the upstream end and an outlet into the trunk sewer from its downstream end, is constructed at a point where a branch sewer enters a trunk sewer.

RATIONAL 'RATIONAL' METHOD OF STORM DRAINAGE DESIGN,
R. A. Rogers.
J Irrigation Drainage Div, Am Soc Civil Engrs, Vol 94, No IR4, p 465-480, 1968.

Descriptors: *Storm drains, *Drainage systems, *Design, *Rational formula, *Non-uniform flow, *Computer programs, Runoff Pipes.
Identifiers: *Submerged systems.

The method of a storm drainage system design is presented which utilizes the Rational Formula with a modification to allow for nonuniform runoff. The system is designed for critical periods when flow in a system or parts of a system is maximum as determined from a hydrograph of the runoff. This method is particularly suited for the design of submerged systems, and therefore, it was computerized. The results of a sample problem show larger pipe sizes than would be found when using the conventional method which adds times of flow in lines to concentration time at some arbitrary starting point.

HANDBOOK OF STEEL DRAINAGE AND HIGHWAY CONSTRUCTION PRODUCTS CHAPTER 4 - HYDRAULICS.

Am Iron Steel Inst, New York, NY, p 82-141, 1967. 47 fig, 18 tab, 22 ref.

Descriptors: *Hydraulic design, *Drainage structures, *Culverts, *Design data, *Runoff forecasting, Open channels, Sewers, Design flow.
Identifiers: *Sewer hydraulics.

This chapter explores the hydraulics of various drainage structures such as open channels, culverts, storm drains, and sanitary sewers, with the emphasis placed on culverts. Section I includes methods of hydrologic design and factors in drainage design. Section II involves the estimation of runoff from small areas and discusses the rational method, watershed characteristics, time of concentration, drainage area, and the Talbot and Burkli-Ziegler formulas. The hydraulics of open drainage channels such as ditches, gutters, and median swales is treated in the next section. Section IV discusses the hydraulics of sewers, including: design flow of sanitary sewers and of storm water; hydraulic considerations for sewers; transitions, bends, and junctions; pipe friction formula values of n -- the roughness coefficient in the Manning equation; determining storm sewer size and the hydraulics of subdrains. RANDOMLY FLUCTUATING FLOW IN A CHANNEL DUE TO RANDOMLY FLUCTUATING PRESSURE GRADIENTS,
National Aeronautics and Space Administration, Cleveland, Ohio, Lewis Research Center.
Morris Perlmutter.
Available from the National Technical Information Service as N71-18629, $3.00 in paper copy, $0.95 in microfiche. National Aeronautics and Space Administration Technical Note NASA TN D-6213, March 1971. 31 p, 7 fig, 13 ref.

Descriptors: *Open channel flow, *Steady flow, *Unsteady flow, Markov processes, Pressure, Frequency analysis, Hydraulic gradient, Fourier analysis, Stochastic processes, Statistical methods, Mathematical studies.
Identifiers: Fluctuating flow.

A randomly fluctuating pressure gradient of a stationary Gaussian Markovian form will cause a randomly fluctuating velocity to be superimposed on the steady incompressible flow in a channel. Correlations, spectra, and frequency response functions for the random functions are given. Random pressure signals were generated using Fourier series expansion with coefficients randomly picked from distributions whose parameters were obtained from the spectra of the pressure signal. The random velocity signals were then obtained from the pressure signal by use of the frequency response function calculated from the equation of motion. The increased power loss due to the fluctuations is given and the random pressure and velocity signals are compared for amplitude, frequency, and time lag. (Knapp-USGS)

SYSTEM DESIGN,
George E. Symons.
Water Wastes Eng, Vol 4, No 9, p M3-M21, Sep 1967.

Descriptors: *Sewerage, *Sewers, *Design, *Hydraulics, *Installation, *Storage tanks, Sewage treatment, Design flow, Storm runoff, Overflow, Water pollution control, Waste water treatment.
Identifiers: Combined sewers, Storm sewers.

This digest of information on sewerage systems includes definitions, explanations, and tabular data on a wide range of topics such as: sewer type classifications, considerations in sewer design, sanitary sewers, sewer hydraulics, storm and combined sewers, sewer appurtenances, and inplant piping systems. Conditions are enumerated under which sanitary sewers, combined sewers, or separate sewers should be installed. Storm sewers are recommended to relieve loads on existing combined sewers. Stormwater treatment is suggested unless an alternative can be employed such as sanitary wastes transport under pressure through small lines laid in existing combined sewers. The planning and design of storm and combined sewers is described including correct location and design capacity of such systems. Appurtenances relating to stormwater runoff, such as overflows and storm tanks, are defined and described. Storm tanks are more commonly used in combined systems in order that stormwater eventually be passed to sewage treatment works to avoid overflow of storm water into nearby bodies of water. Such tanks operate under gravity or pumping conditions. Tables, diagrams, and graphs in the digest include: sewer classification, sewer system layouts, population trends in the U.S., quantities of water and sewage flow in U.S. cities, amounts of hourly and daily sewage flow in a sample city, extreme flow rates as a function of population, filtration specifications, rates of flow using Bernoulli's, Manning's, and Hanzen-Williams' formulas, a sewer design slide rule, sewer hydraulic information, recommended minimum sewer grades, and design criteria for sewer appurtenances.

SOLUTION OF THE UNSTEADY ONE-DIMENSIONAL EQUATIONS OF NON-LINEAR SHALLOW WATER THEORY BY THE LAX-WENDROFF METHOD, WITH APPLICATIONS TO HYDRAULICS,
Royal Aircraft Establishment, Farnborough (England).
M. R. Abbott.
Available from NTIS as AD-706 649, $3.00 in paper copy, $0.95 in microfiche. Technical Report 69179, August 1969. 14 fig, 6 ref.

Descriptors: *Open channel flow.
Identifiers: *Shallow water, One-dimensional flow, Rivers, Equations of motion, Mathematical analysis, Great Britain, Lax-Wendroff method.

An adaptation of the two-step Lax-Wendroff method is used for solving the unsteady one-dimensional equations of non-linear shallow water theory, including both frictional resistance and lateral inflow terms. This finite difference method is fast, accurate and simple to programme and covers the formation and subsequent history of discontinuities in the solution, in the form of bores and hydraulic jumps, without any special procedures. The behaviour of the numerical solution behind these jumps is found in the examples to be sufficiently smooth without the addition of an artificial viscous force term. A variety of illustrative examples is given, including simple cases of flood waves in rivers, bores in channels resulting from rapid changes of upstream conditions, oscillatory waves on a super-critical stream and a simple hydrology example with a significant lateral inflow from rain. Several checks of the numerical method are included. The examples are confined to channels of uniform rectangular cross-section, but the method generalizes in a straightforward way to real rivers and estuaries in which the cross-section is non-rectangular and varies along the length of the channel.

EFFECT OF FREE STREAM TURBULENCE ON THE DRAG COEFFICIENT OF ANGULAR BLUNT BODIES,
Washington State Univ., Pullman.
J. A. Roberson.
Paper American Society of Civil Engineers, ASCE Hydraulic Division Special Conference, Univ Minn, Aug 1970. 32 p, 18 fig, 8 ref, append.

Descriptors: *Fluid mechanics, *Turbulence, Turbulent flow, Laboratory tests, *Drag, Turbulent boundary layers, Research and development, *Flow around objects, Wind tunnels, Pressure distribution, Flow patterns, Test procedures, Reynolds number, Effects, Flow separation, Hydraulics, Scale effect.
Identifiers: Drag-force, *Blunt bodies.

Tests made in a low-speed wind tunnel at Washington State University, Pullman, to study the effects of free stream turbulence on the coefficient of drag for angular bodies are described. Body shapes were tested for several conditions of free stream turbulence. Tests show that: (1) changes of the free stream turbulence intensity cause changes in the flow pattern and Reynolds stress within the flow about a body; (2) bodies having shapes such that reattachment of flow is not a factor experience an increase in the drag coefficient with increased turbulence intensity; (3) bodies for which reattachment or near reattachment of flow occurs with increased turbulence may experience an increase or decrease in drag coefficient with increased turbulence intensity, depending upon body shape, and pressure distribution on the sides of such bodies may change as much as 100% with a 10% change in turbulence intensity; and (4) free stream turbulence can cause unsteady dynamic forces on some body shapes. PRINCIPLES AND PRACTICAL METHODS OF DEVELOPING WATER WELLS.
U.O.P., St. Paul, Minn. Johnson Div.

U.O.P. Johnson Division Bulletin No 1033, (Revised June 1968). 24 p, 23 fig.

Descriptors: *Water wells, *Groundwater, Wells, Hydraulics, Screens, Drawdown, Hydraulic gradient, Well capacity, Sands, Gravels.

Identifiers: *Well hydraulics, Over-pumping, Backwashing, Surge plungers, Compressed air, High velocity jetting, Well design, Bridging.

Water-well development and the importance of well screen selection have occupied the attention of many water well drillers for the past several decades. The well screen is the intake portion of the well structure for a well that obtains water from a water-bearing sand. The well screen allows water to enter the well freely, prevents sand from entering with the water, and serves as a structural support for the loose formation material. By experience over the years, drillers found that when the well screen openings are so small as to retain almost all the sand, the yield of the well is limited because adequate development of the formation cannot be done. They also found that too large openings permit the removal of too much of the formation resulting in settlement of overlying materials, or incomplete stabilization of the formation. Well screen openings of the right size permit development to the proper extent. This produces the desired results - good well efficiency and sand-free water. The development of wells by 'over-pumping' and 'backwashing' and with surge plungers, compressed air, and with high velocity jetting is also discussed in detail. (Campbell-NWWA)

TAKING REPRESENTATIVE FORMATION SAMPLES.
U.O.P., St. Paul, Minn. Johnson Div.

U.O.P. Johnson Division Bulletin No 638-S, (Revised December 1967). 2 p.

Descriptors: *Sampling, *Rotary drilling, Data collections, Drilling fluids.
Identifiers: Heaving, *Formation analysis, Drive-core sampling, Hydraulic drilling methods, Handling formation samples.

Much of the success of a completed water well depends upon the degree of care exercised in obtaining formation samples for analysis - a responsibility which lies directly with the driller. The right well screen for a given water-bearing formation can be recommended and provided by the screen manufacturer only when the samples are representative of the various strata in the formation. Correct labeling of samples, full and accurate information describing water levels, depths, methods of construction to be used and the amount of water wanted are also essential. Care and good judgment, plus observance of a few simple rules, are the critical items in obtaining formation samples for analysis. (Campbell-NWWA)

WELL POINT SYSTEMS.
U.O.P., St. Paul, Minn. Johnson Div.

U.O.P. Johnson Division Bulletin No 467D, (Revised March 1969). 9 p, 11 fig.

Descriptors: *Well points, *Dewatering, *Water wells, Water table, Groundwater, Well screens, Water supply, Screens.
Identifiers: *Well spacing, Screen length, Piping and connections, Typical irrigation systems, Dewatering systems, Depth of setting.

Well-point systems or suction-lift wells, can supply large quantities of water economically, where conditions are favorable. Three conditions are necessary. The water table must be within a few feet of the land surface to permit pumping from the wells by suction lift; a good stratum of water-bearing sand and gravel must be found at depths of 20 to 50 feet; and the wells themselves must be highly efficient. Well-point systems find extensive practical use in four fields: (1) to obtain water for irrigation; (2) to obtain water for muncipal or industrial purposes; (3) to temprarily dewater construction sites in wet ground; (4) to permanently lower the water table over an area for special reasons. The first two of these applications put the water to beneficial use. The third and fourth are drainage measures where the groundwater is carried away and wasted after being pumped from the wells. The operating principles and the installation details of well-point systems to supply water for irrigation or other uses are described. The fundamentals of dewatering are also discussed. (Campbell-NWWA)
W71-06948

TESTING WATER WELLS FOR DRAWDOWN AND YIELD.
U.O.P., St. Paul, Minn. Johnson Div.

U.O.P. Johnson Division Bulletin No 1243, (Revised April 1967). 8 p, 2 tab, 8 fig.

Descriptors: *Water wells, *Drawdown, Specific yield, Pumps, Static level.
Identifiers: *Pumping level, *Measuring water levels, Orifice meter, Weirs.

No matter what the size of a well or the quantity of water it will yield, if it is to be equipped with a permanent pump to operate at the highest efficiency, it should be accurately tested for drawdown and yield before the pump is purchased. Buying a pump without such a test is a good deal like buying a 'pig in a pole.' Many times high pumping costs and unsatisfactory pump performance have been erroneously charged to the well. In these cases an accurate test of the well in advance of the pump purchase would have more than paid for itself in the first cost of equipment and later on in operating costs. There are many ways to test a well for capacity, some of them good and some bad. If a well is important enough to be tested for capacity on completion, it is essential that it be tested accurately by the use of approved measuring devices and standard methods. Furthermore, to avoid confusion and misunderstandings, there must be agreement on and understanding of the terms commonly used in making capacity test of wells. It is the purpose of this bulletin to describe the most accurate and inexpensive methods of determing the actual yielding capacity of a finished well. Principal terms in use are discussed. (Campbell-NWWA)

HYDRAULIC FRACTURING,
G. C. Howard, and C. R. Fast.
New York, Society of Petroleum Engineers of AIME, 1970. 210 p.

Descriptors: *Hydraulics, *Oil industry, *Aquifer characteristics, *Injection wells, Cavitation, Flow characteristics, Hydraulic engineering, Hydraulic properties, Fluid mechanics, Acidizing, Cementing.
Identifiers: *Hydraulic fracturing, *Deep disposal wells, Fracture area, Fracturing fluids and additives, Propping agents.

Hydraulic fracturing is a method for increasing well productivity by fracturing the producing formation and thus increasing the well drainage area. This monograph is designed to be a thesis on hydraulic fracturing covering the state-of-the-art from the theory and technique of hydraulic fracturing to the application of nuclear energy as a means of cracking the reservoir rock and forming rubble. Hydraulic fracturing is based on the fact that injection pressure decreases when water, acid, cement or oil is pumped into a formation at high rate and at a high initial pressure. This work has considerable value in deep well liquid waste disposal applications and provides the practicing engineer with a source of information that will aid in judging the relative merits of various hydraulic fracturing treating procedures and the results to be expected from such methods. (Campbell-NWWA)

SOURCE WATER WELL DESIGN AND EFFICIENCY,
U.O.P., St. Paul, Minn. Johnson Div.
R. L. Schreurs.
Symposium on Treatment and Control of Injection Waters, Division of Production, American Petroleum Institute, Anaheim, California, November 1966. 18 p, 2 tab, 8 fig, 16 ref, 3 append.

Descriptors: *Water wells, *Drilling, *Oil industry, Specific capacity, Drawdown, Rotary drilling.
Identifiers: *Water well hydraulics, Damage ratio, *Water well design.

Many cheap source water wells actually can be expensive if they are inefficient and are produced for long periods of time. It is important to have efficient water wells so as to reduce the required number of wells and to minimize power costs. Several methods of determining the efficiency of wells as hydraulic structures are described. The damage ratio of a well is approximately related to the efficiency. Water well designers use an average inlet velocity of about 0.1 foot per second to minimize well losses, frequency of well development, and to prolong well life. Special terms are defined and case histories cited. Water well design and construction determine well efficiency. Important factors to be considered are the type of aquifer whether consolidated or unconsolidated, the length, the location and type of screening device, and the effectiveness of development. The petroleum industry and the water-well industry would benefit by a greater exchange of theoretical and practical information. (Campbell-NWWA)

RAIN-GAUGING PROGRAM TO PROVIDE GUIDE TO STORM SEWER DESIGN,
Harvey W. Duff, Russ L. Tobey, and George C. C. Hsieh.
Water Sewage Works, Vol 116, No 11, p 420-424, Nov 1969.

Descriptors: *Rain gages, *Data collections, *Storm drains, *Design criteria, *Electronic equipment, Computers.
Identifiers: *Rain data, *Storm sewers, *Seattle, Washington.

The Sewage and Drainage Section, Design Division of the Seattle, Washington, Engineering Department, is conducting a rain gaging program to provide sufficient precipitation data and storm data for urban-water studies for the purpose of determining a more realistic basis for the design of storm drain systems. Data for the program are obtained from electronic instruments and handled by a computer. It is estimated that only 0.2 percent of the possible data covering a four-year period is missing.

ORGANIZING AND PLANNING FOR SEWER MAINTENANCE,
Glen J. Hopkins, and Don Hurlbert.
J Water Pollution Control Fed, Vol 39, No 2, p 230-239, Feb 1967.

Descriptors: *Maintenance, *Repairing, Sewerage, Gate control, Missouri.
Identifiers: Storm sewer valves, Sewer separation, Kansas City (Mo).

The sewer maintenance program devised by the Maintenance Division of the Department of Pollution Control, Kansas City, Mo., is geared toward public service in the quick repair of damaged sewers, whatever the cause. This program also deals with sewer and catch basin cleaning, sewer malfunctions and connections, and preventive maintenance. The sewer system includes a number of gate and sluice gate valves on storm sewers that must be closed in times of flooding. In the case of overloaded sewers, if stormwater lines are found to be connected to sanitary sewers, the Maintenance Division requests that the two lines be disconnected.

HANDBOOK OF STEEL DRAINAGE AND HIGHWAY CONSTRUCTION PRODUCTS: CHAPTER 7 - INSTALLATION INSTRUCTIONS.

Am Iron Steel Inst, New York, NY, p 160-183, 1967. 22 fig, 3 ref.

Descriptors: *Steel structures, *Installation.
Identifiers: *Corrugated steel, *Installation methods, Installation procedure.

Because of their strength, light weight, and resistance to fracture, corrugated steel structures can be installed rapidly, easily, and with the least expensive machinery. The first part of this chapter outlines the importance of good installation and the advantages of using corrugated steel in installation procedures. Other subsections discuss: preparation of the base, assembly of pipe culverts and sewers, vertical elongation of corrugated steel pipe, and backfilling. Entire sections are devoted to jacking, boring, lining, and bridge filling. (See also W71-06639)

OVERVOLTAGES AND INSULATION COORDINATION ANALYSIS AND APPLICATION FOR 735 KV,
Hydro-Quebec (Canada).
G. A. Baril, M. B. Guertin, and J. Parent.
Paper 33-09, CIGRE International Conference Large High Tension Electric Systems, Paris, France, Aug-Sep, 1970. 11 p, 4 fig, 3 tab, 8 ref.

Descriptors: *Extra high voltage, *Transmission lines, *Switching surges, Transmission (Electrical), Substations (Electrical), Test results, *Overvoltage, *Electrical insulation, Network analysis, Shunt reactors, Foreign research, Circuit breakers, Coordination, Ultra high voltage, Flashover, Electric coronas.
Identifiers: Canada, Manicouagan-Outardes (Can).

Results of switching overvoltage studies performed on a transient network analyzer for Manicouagan-Outardes and Churchill Falls 735-kv transmission systems are presented. Power-frequency overvoltages were considered during the studies. The results are analyzed to determine effects of various parameters on the switching surge overvoltages, and conclusions are applied to the insulation adopted for the lines. Based on international standards and recent technical achievements, the evolution of insulation coordination for the 735-kv system is examined. An identical procedure is applied to the evaluation of transmission line and substation insulation for 1000 kv and above. Reducing power-frequency overvoltages to a level lower than the maximum switching surge overvoltage will allow full use of surge diverters, thus ensuring adequate protection and acceptable insulation levels. (USBR)
W71-06835

UNDERGROUND POWER TRANSMISSION,
Ion Physics Corp, Burlington, Mass.
P. H. Rose.
Science Vol 170, No 3955, p 267-273, Oct 1970. 7 p, 7 fig, 1 tab, 24 ref.

Descriptors: Cryogenics, *Transmission (Electrical), Costs, Economics, Aesthetics, Electrical insulation, Electric power losses, Bibliographies, Public opinion, Superconductors, Alternating current, Direct current, Research and development, Converters (Electrical), Dielectrics, Transmission loss.
Identifiers: Gas-pressure cables.

Public opinion will override economic arguments for future underground transmission. Providing more electrical power and satisfying higher aesthetic standards will be expensive. Many technical problems must be solved for underground cables. Resistive losses causing cable temperature to rise, charging current of a-c cables resulting in critical lengths for power transmission, and insulation problems are only a few of the areas where much research is needed. Underground cables can be installed in trenches in some places, and in other cases service tunnels will be required under congested areas. Cryogenic cables cooled by hydrogen are being investigated; additional research is needed to assure safe installation in cities. Many questions of underground transmission are discussed and some data are given on research being conducted. (USBR)

RELAXATION OF INITIAL STRESSES IN BOLTED CONNECTIONS OF HYDRAULIC UNIT ROTORS DURING INTERMITTENT LOADS,
Bureau of Reclamation, Denver, Colo.
P. A. Pavlov, A. U. Gugov, and G. V. Isaev.
Available from NTIS as PB-193 627T, $3.00 in paper copy, $0.95 in microfiche. Bureau of Reclamation Translation No. 701, Denver, Oct 1967. 11 p.

Descriptors: *Hydraulic turbines, *Impellers, *Hydraulic systems, Stators, Failure (Mechanics).
Identifiers: Bolted joints, Relaxation time, USSR, Translations.

With the increasing size and weight of modern high-power hydroturbine units, the bolted connections of the rotors to the shaft become one of the prime areas on which the reliability of the unit depends. Because of a failure of the bolted connection of a runner to a turbine shaft, the Leningrad Metalworks devised test procedures and equipment to investigate the relaxation of the initial stresses in bolted connections of hydraulic units. The equipment and procedures are described and graphs showing the results of the tests are given. Conclusions are: (1) Relaxation of initial stresses in the bolts is mainly due to residual stresses in the threads growing in proportion to the number of cycles of changes in live load. (2) Degree of relaxation is reduced in proportion to the increase in initial torque. (3) The basic cause of the failure investigated was insufficient torque of the bolts, which lead to intensive relaxation of the initial stresses corresponding to an increase in the additional stresses due to the action of external loads and finally to fatigue.

DESIGNING HYDRAULIC TURBINE PARTS FOR STRENGTH,
Bureau of Reclamation, Denver, Colo.
A. Ya. Aronson, A. U. Bugov, V. M. Malyshev, I. A. Skrylev, and G. Kh. Frank-Kamenetskii.
Available from NTIS as PB-193 619T, $3.00 in paper copy, $0.95 in microfiche. Bureau of Reclamation Translation No 687, Denver, Colo, Aug 1967. 44 p. Translated from Izdat. 'Mashinostroenie,' Moscow-Leningrad, p 303-328, 1965.

Descriptors: *Hydraulic turbines, *Hydrodyamics, *Hydraulic systems, Structural behavior, Deformation, Stress.
Identifiers: Turbine parts, Structural shells, USSR, Translations.

Leningrad Metalworks engineers have developed a method of calculating stress conditions in metal spiral cases based on their experimental investigations and study of shell structures for different turbine components. The method uses the principle of superposition of stress conditions of the: (1) joint of spiral case with speed ring; (2) region somewhat removed from the speed ring, (3) joint between steel sheets of different thicknesses, (4) transition zone from free shell to concrete embedment, and (5) end of the ribbing. Meridional forces are calculated from the membrane theory of torus-shaped shells. For moment and horizontal forces where the spiral attaches to the speed ring, the latter can be considered as a rigid torus-shaped shell or, for welded spiral cases, an imaginary conical shell can be substituted and equations for deformation of conical shells used. For computing different types of ribbing depending on stress distribution, change of moment, and boundary stresses. Experiments show that stresses are distributed very unevenly in each section, the greatest being where the spiral is joined to the speed ring bands. Where the lower part is embedded in concrete, stress inequality appears only in the upper band. (Translator)

APPROXIMATE CALCULATION OF THE NATURAL FREQUENCIES OF VIBRATION OF RUNNERS OF FRANCIS HYDRAULIC TURBINES,
Bureau of Reclamation, Denver, Colo.
A. Ya. Aronson, M. M. Mishin, and D. S. Moskvin.
Available from NTIS as PB-193 631T, $3.00 in paper copy, $0.95 in microfiche. Bureau of Reclamation Translation No 707, Jan 1967. 11 p, 1 tab, 4 ref.
Identifiers: *Francis turbines, Foreign design practices, Turbine parts, *Natural frequency, *Vibrations, *Hydraulic turbines, *Turbine runners, Turbine blades, Digital computers, *Mathematical analysis, Elasticity, Elastic deformation, Rigidity, Structural analysis, Structural behavior, Flexible foundations, Rings, Resonance, Rotation, Matrix algebra, USSR, Approximation method, Elastic foundations, Matrix methods, Structural, Leningrad Metworks, USSR.

Since the natural vibration frequencies of Francis hydraulic turbines must be determined during design, and the present method of calculation used at the Leningrad Metalworks in the USSR is long and cumbersome, approximate formulas were developed for calculating these frequencies, fully satisfactory for an evaluation of the several preliminary design variants of the runner. Calculating and test work in this field have established the fact that the runner band vibrates either as a ring or is displaced as a solid body during vibration of the runner system. Alternation of vibrational frequencies and modes is involved later in the actual design of the runner; so, at this stage, considering that the band vibrates as a ring and the mass of blades does not substantially affect the frequency, it is satisfactory to assume that when the number of blades is large, the action on the band can substitute for the action on any equivalent elastic foundation. Thus, the problem is reduced to an examination of vibrations of a ring on an elastic foundation. This is valid only for the several primary modes. Sample calculations are given, the results of which compare favorably with test values of frequencies.
W71-06937

THE EFFECT OF CAVITATION TYPE ON THE FORM OF HYDROTURBINE SEPARATION CHARACTERISTICS,
Bureau of Reclamation, Denver, Colo.
L. S. Shmuglyakov.
Available from NTIS as PB-193 626T, $3.00 in paper copy, $0.95 in microfiche. Bureau of Reclamation Translation No 699, July 1969. 10 p, 3 fig, 9 ref. Translated from: Energomashinostroenie No 1, p 25-27, 1963.
Identifiers: *Cavitation, *Hydraulic turbines, *Flow separation, Flow characteristics, Hydraulic machinery, Water, Physical properties, Laboratory tests, Flow patterns.

The form of hydroturbine separation characteristics, types of cavitation and the interrelations between the separation characteristics of cavitation types are analyzed. Methods of investigating cavitation based on the physical properties of the flow are compared, and critical states during cavitation are discussed. Restrictions imposed on laboratory studies of cavitation are noted. Applications of cavitation studies in monitoring the operation hydraulic machines at hydroelectric power plants are considered. It is concluded that all the procedures recently developed under laboratory and natural conditions are applicable in more exact analysis of cavitation operation conditions.

MOLE TUNNELING RESEARCH ADVOCATED.

Civil Eng, Vol 37, No 8, p 48-49, Aug 1967. 1 diag.

Descriptors: *Tunneling, *Tunnels, *Comparative costs.
Identifiers: *Mole.

Dr. Walter Hibbard, Jr., Bureau of the Mines Director, recently emphasized the need for more research and development on mechanized tunneling. There is a growing demand for tunnels for the following purposes: subways, utilities, transmission lines, mining, and urban freeways. Needs in each of these areas are discussed as are advances already made with the mole borer. Savings in the billion-dollar range are possible with advanced tunneling procedures. In addition to pefecting moles, guidance control, placement of lining, and methods for the transportation of muck out of the tunnel must be developed.

Proc American Society of Civil Engineering Journal of Soil Mechanics and Foundation Division, Vol 96, No SM5, p 1655-1681, Sept 1970. 27 p, 20 fig, 2 tab, 25 ref, 2 append.

Descriptors: *Cut slopes, *Excavation, Failure (Mechanics), *Slope stability, Soil engineering, *Soil mechanics, Stress, Soil properties, Soil stability, Soil tests, *Movement, Deformation, Rebound, Strain, Bibliographies, Analysis, Behavior, Instrumentation, *Finite element method, Computer applications, Undisturbed soils.

Large soil movements in the 160-ft-deep excavation for the Buena Vista Pumping Plant in California prompted an investigation to determine if the movements were indicative of impending failure. The investigation consisted of: (1) conducting laboratory tests on undisturbed soil specimens to determine the strength and nonlinear properties of the soil; and (2) performing finite element analyses using the nonlinear soil properties to calculate soil movements and stresses at the end of excavation. Results of the analyses agreed well with the observed behavior of the excavation with regard to magnitude of soil movements and development of regions of local failure. Calculated stresses indicated that the soil movements were not indicative of impending failure. The case study shows that nonlinear finite element analyses, together with field instrumentation observations, form an effective means of investigating complex soil engineering problems. Has 25 references. (USBR)

OBSERVATIONAL DATA ON GROUND MOVEMENTS RELATED TO SLOPE INSTABILITY,
Shannon and Wilson, Seattle, Wash.
S. D. Wilson.
Proceedings American Society of Civil Engineers, Journal of the Soil Mechanics and Foundation Division, Vol 96, No SM5, p 1519-1544, Sept 1970. 26 p, 27 fig, 8 ref, append.

Descriptors: Deformation, Excavation, Failure (Mechanics), Field tests, Field data, Measuring instruments, Shear stress, *Slope stability, Stability, Soil mechanics, *Landslides, Displacements, Slopes, Movement, Earth movements, *Clays, Clay shales, Cuts, Fills, Slope stabilization, Failure surfaces.
Identifiers: *Progressive failures, *Terzaghi Lecture, Earth slides, Remedial treatment.

Data from field measurements that verify the progressive nature of landslides resulting from excavations at the toe of slopes in overconsolidated highly plastic clays and clay shales are presented. The data agree with generally accepted hypotheses concerning the mechanism of such progressive failures. Distribution of such movements changes with time, and total movements and velocities must be reviewed to understand the failure process. Horizontal movements resulting from construction of embankments on soft clays are progressive and similar to those resulting from cuts in overconsolidated clays. These movements often extend well beyond the toe of the embankment except when the fill is placed on a stiff layer overlying soft materials. Several progressive slides were stabilized by corrective treatment, including cylinder pile retaining walls, underground concrete buttresses, and slope flattening. Analysis of field observational data leads to a better understanding of the mechanism of failure and ultimately may lead to improved methods of stability analysis. (USBR)

ELASTIC ANALYSIS FOR BEHAVIOR OF ROCKFILL,
Bechtel Pacific Corp. Ltd., Melbourne (Australia).
N. O. Boughton.
Proc American Society of Civil Engineers, Journal of Soil Mechanics and Foundation Division, Vol 96, No SM5, p 1715-1733, Sept 1970. 19 p, 12 fig, 2 tab, 9 ref, 2 append.

Descriptors: Elastic theory, Computation, *Structural behavior, Dams, *Rockfill dams, Rock properties, Deformation, Rocks, Soil mechanics, Elasticity (Mechanical), Shear tests, Leakage, Strain, Stress, Seepage, Impervious membranes, Dam design, Settlement (Structural), *Dam facings, Computer applications, *Finite-element method, Triaxial tests.
Identifiers: Concrete slabs.

All concrete-faced rockfill dams higher than 300 ft have had serious leakage problems when first filled. In attempts to determine causes and to provide a rational basis for design, finite-element procedures are applied to rockfill dams with concrete faces. The application requires knowing the tangent elastic properties of rockfill at each state of stress in the analysis. The properties are determined from triaxial test results on several different rockfill materials, and stress-history dependent values for Young's Modulus and Poisson's Ratio are obtained. As a check on the validity of this procedure, the elastic analysis with stress-history dependent parameters is applied to confined compression and direct shear tests; consistent results are obtained in each case. Application of finite-element procedures using these elastic parameters to rockfill dams indicates that high tensions exist around the perimeter of the concrete face, and that the face has a considerable influence on the deformations of the underlying rockfill. (USBR)

A NEW TECHNIQUE FOR SOIL STRAIN MEASUREMENT,
E. T. Selig, and O. H. Grangaard, Jr.
Materials Research and Standards, Vol 10, No 11, p 19-21, 35, Nov 1970. 5 p, 12 fig, 6 ref.

Descriptors: Soil engineering, Soil mechanics, *Measuring instruments, *Soils, Soil tests, Strain, *Strain measurement, Embedded instruments, Field tests, Laboratory tests, Sensors, *Strain gages, Instrumentation, Calibrations, Dynamic response, Volume change, Measurement.
Identifiers: Static behavior.

A new instrumentation system has been developed for measuring static and dynamic strains in soil. The strain gage system is battery powered and portable for use in the field and laboratory. The

principle of operation involves the mutual inductance coupling between 2 coaxial soil sensors embedded within the soil. The coupling is extremely sensitive to the distance between sensors, and may be directly related to strain. Essential elements of the strain gage system are: (1) a pair of rugged disk-shaped sensors embedded in the soil in near parallel and coaxial orientation separated by a distance over which strain is to be averaged; and (2) a portable instrument package containing driving, amplification, balancing, calibration, and readout controls. The sensors are free-floating in the soil to provide minimal interference with the soil movements, a unique feature. Accuracy of readings is not affected by normal changes in soil composition or moisture content. Advantages, limitations, and examples of application of the system are presented. Studies show that the technique is simple, reliable, and versatile. (USBR)

R. K. Carter, C. W. Lovell, Jr., and M. E. Harr.
Available from National Technical Information Service as PB-198 432, $3.00 in paper copy, $0.95 in microfiche. Purdue University Water Resources Center, Technical Report No 17, January, 1971. 220 p, 14 fig, 5 tab, 19 ref, append. OWRR Project A-009-IND (1).

Descriptors: *Slope stabilization, Bank stabilization, *Slope stability, *Reservoir, Embankments, Landslides, Programming languages, Steady flow, Bearing strength.
Identifiers: Taylor solution, Bishop method, Modified bishop method, Critical sharing surface.

The purpose of the research was to develop a computer-assisted system of stability analysis for specific reservoir slopes. The versatility of the developed programs includes accommodations for variable ground surface and profile characteristics, both uniform and concentrated external boundary loadings, spatial variations in water pressure, and irregular as well as circular shaped failure surfaces. Several limiting equilibrium analyses by methods of slices have been reviewed. One of these, the Modified Bishop technique, previously considered applicable only to circular failure surfaces, was modified to include irregular shaped surfaces. The programs have been written in elementary Fortran IV language. There are currently five main programs and eleven integrated supporting routines. Conversion of the programs to small computer systems is considered highly practical. (Wiersma-Purdue)

SOME INFLUENCES OF GEOLOGY AND MINING UPON THE THREE-DIMENSIONAL STRESS FIELD IN A METAMORPHIC ROCK MASS,
Geological Survey, Denver, Colo.; and Arizona Univ., Tucson.
T. C. Nichols, Jr., F. T. Lee, and J. F. Abel, Jr.
Engineering Geology (Bull AEG), Vol 6, No 2, p 131-143, Fall, 1969. 13 p, 7 fig, 8 ref.

Descriptors: Rock excavation, *Rock mechanics, Stress, Measuring instruments, *Stress distribution, Geology, Field tests, Strain, Mining, *Tunnels, Residual stress, Rocks, Three-dimensional, Displacements, Engineering geology, Stress concentration, Deformation, Rock pressures, Probes (Instruments), *Underground openings, In situ tests.
Identifiers: *Borehole deformation gage, Subsurface openings.

A solid inclusion borehole probe for determining 3-dimensional stress changes in rock has been developed by the Geological Survey in connection with an applied rock mechanics research project. Preliminary findings using the probe to determine the influence of excavation procedures, geologic conditions, and the pre-existing stress field upon the changing stress field in rock around an active opening are presented. Results show that major geologic structural features such as foliation, prominent joint sets, and faults have a major influence on redistribution of rock stress around an actively excavated opening, and excavation operations and original rock stresses can significantly influence stress redistribution in a manner that commonly cannot be explained by an elastic analysis. HYDRAULIC JET DRILLING,
Esso Production Research Co., Houston, Texas.
William C. Maurer, and Joe K. Heilhecker.
Society of Petroleum Engineers, AIME, Preprint No SPE 24-34, p 213-224, 1969. 6 tab, 17 fig, 15 ref.

Descriptors: *Drilling, *Rock mechanics, Rock properties, Drilling equipment.
Identifiers: *Drilling research, Novel drilling techniques, Hydraulic jet drilling, Rock strength, Berea sandstone, Indiana limestone.

As a result of a detailed survey of over 25 novel drilling techniques, a laboratory study of hydraulic jet drilling was made. In initial tests, a cannon was used to fire 1.45-gal water pulses at rocks at pressures up to 25,000 psi. These tests showed that a threshold nozzle pressure must be exceeded before hydraulic jets will drill rock. Water jets having diameters of 0.2 to 1 in. drilled holes with diameters ranging from 0.8 to 4 in. in sandstone and limestone. These holes, which were 1 to 3 in. deep, were drilled in 0.02 to 0.2 seconds. These tests showed that water jets can effectively drill sedimentary rocks. Following these tests, a 2-in. diameter hydraulic jet drill was tested in a laboratory rig. A high pressure pump was used to pump water continuously through this drill at pressures up to 13,500 psi. This drill penetrated Carthage marble at 180 ft/hour, Indiana limestone at 280 ft/hour and Berea sandstone at 300 ft/hour. These tests showed that a full-scale hydraulic jet drill (3,000 hp) should drill 8 in. diameter holes in average-strength sedimentary rocks at rates of 200 to 300 ft/hour. These high drilling rates show that hydraulic jet drills have high potential for drilling oil wells economically. This paper is exceptionally well illustrated and well referenced. (Campbell-NWWA)

THE EFFECT OF HEAT ON SOME MECHANICAL PROPERTIES OF IGNEOUS ROCKS,
Gulf Research and Development Co., Pittsburgh, Pa.
A. B. Barbish, and G. H. Gardner.
Society of Petroleum Engineers Journal, December 1969, p 395-402. 2 tab, 13 fig, 5 ref.

Descriptors: *Rock properties, *Rock mechanics, *Drilling research, Aquifer characteristics, Gabbro, Pennylvania.
Identifiers: *Elastic moduli, Weibull parameters, Point penetration, Microcracks, Bending strength, French Creek (Pa).

The elastic moduli of most igneous rocks are greatly reduced by heating and depend, at room temperature, on the highest temperature to which they have been previously heated. This phenomenon was investigated by measuring velocity, attenuation, bending strength, and point penetration as functions of moisture content, porepressure, confining pressure, and highest previous temperature for a series of gabbro samples from French Creek, Pa. Bending strength and point pentration tests indicated that the microcracks introduced by heating to temperatures up to 1000 deg C have few cracks and are very uniformly distributed. Though the porosity was only about one percent, the attenuation of sound waves was found to be very dependent on moisture content. The attenuation was also found to increase greatly when the pore pressure and confining pressure were increased equally, even though the elastic moduli remained almost constant during the changes. The Weibull parameters were measured, but the uniformity of the material made exact determinations difficult. (Campbell-NWWA)

JACKS SAVE DAY FOR TEXAS TUNNELER.

Construct Methods Equip, Vol 51, No 9, p 90-93, Sep 1969. 7 fig.

Descriptors: *Tunneling, *Tunnel construction, *Tunneling machines.
Identifiers: *Pipe jacking, *Reaming auger, Houston, Texas.

To tunnel and line three oversized utility conduits under a Houston street, the subcontractor resorted to pipe-jacking instead of machine-tunneling when crews were unable to hold the boring rig on the center-line. The subcontractor planned to use a rig that was custom-built for a Dallas storm-drain project. With the addition of a shield over the auger, the job was attempted in Houston's soft earth. After the centering trouble stopped work, the remaining tunnels were completed by mining with pneumatic shovels and jacking the liners into place with the subcontractor's designed equipment.

American Iron and Steel Inst., New York.

Am Iron Steel Inst, New York, NY, p 64-81, 1967. 20 fig, 2 tab, 10 ref.

Descriptors: *Drainage systems, *Steel structures, *Economic feasibility, Inspection.
Identifiers: Soil conditions, Water conditions.

This chapter confirms that corrugated steel drainage structures can be economically designed for either normal conditions or for highly corrosive industrial and sanitary sewers and for mining, salt water and other difficult service conditions. The first section deals with inspection methods and results, including parts on: destructive forces; methods of determining durability; laboratory tests; highway culvert inspections; sewer inspections, air force base drainage inspection; airport drainage; and levee culverts and sewers. Section II concerns the influence of various types of soil and water conditions, and Section III discusses design for service life, including topics such as: the amount of durability needed; service conditions; base metals; galvanized coatings and their service life; non-metallic coatings and linings; pavements in pipe; California service life determination; and miscellaneous products and conditions (subdrainage, steel end sections, steel retaining walls, liner plates, sheeting, and guardrail). BUREAU OF RECLAMATION EXPERIENCE IN USE OF BORING MACHINES IN TUNNEL EXCAVATION,
Bureau of Reclamation, Denver, Colo.
B. P. Bellport.
Paper Fall Meet Society of Mining Engineers, St. Louis, Mo, Oct 1970. 61 p, 15 fig, 1 tab, 8 ref.

Descriptors: *Tunneling machines, *Tunnels, *Rapid excavation, Rocks, *Tunnel construction, Earth handling equipment, Rock excavation, Muck, Ventilation, Geology, Tunnel supports, Tunnel linings, History.

The experiences of the Bureau of Reclamation in the use of tunnel boring machines to excavate 6 major tunnels on water resources development projects are summarized. Case studies for each of the 6 tunnels, with data on tunnel dimensions, geological characteristics of the excavated rock, the tunneling machines used, machine operation, muck handling, method of tunnel support, ventilation system, and related information are presented. Despite the diversity of dimensions and the variety of rock encountered during excavation, the 6 tunnels have one major characteristic in common: excavation was significantly expedited by the use of boring machines. Boring machines make possible smoother walls and uniform diameter, and more importantly in the tunnel lining, considerably less concrete is required to maintain the specified uniform thickness than is required for the rough, irregular walls of a conventionally driven tunnel. One example cited was estimated to require 3-1/2 times more concrete for lining a conventionally excavated tunnel than was used for lining the bored tunnel. (USBR)

LASER ALIGNMENT TECHNIQUES IN TUNNELING,
A. Cooney.
Proceedings American Society of Civil Engineers, Journal of the Surveying and Mapping Division, Vol 96, No SU2, p 229-243, Sept 1970. 15 p, 10 fig, 2 tab, 1 ref, 2 append.

Descriptors: Tunnels, *Tunneling machines, Tunnel construction, Bench marks, Curves, *Alinement, *Lasers, Mining, *Surveying instruments, *Surveying, Construction, Tunneling, Deflection, Gradients, *Control systems, Construction control.
Identifiers: Targets.

With the introduction of the mechanical mining machine or 'mole', the role of the engineer has become one of providing a constant course or direction for the machine rather than establishing and projecting the tunneled path traversed by it. The primary tool in accomplishing this task is an alinement control system capable of providing guidance and detecting and distinguishing the components of motion generated by the mining machine. Consisting of a laser beam instrument, auxiliary control points along the tunnel, and a target system affixed to the machine, such a system provides a graphical guide to the machine operator. The mechanics of setting up such a system are outlined and various types of target systems are categorized. Techniques for adapting such a system to various alinement problems are proposed. (USBR)

PIPELAYER MINIMIZES TRENCHING AND BACKFILLING.

Construct Methods Equip, Vol 51, No 8, p 42-45, Aug 1969.

Descriptors: *Tunneling, *Tunnel construction, *Tunneling machines, *Installation, Pipelines.

Identifiers: *Badger Minor, *Tugmaster, *Galveston, Texas.

The first domestic water system for the Gulf Coast resort area near Galveston is being installed with two trenchless pipelaying methods known as the 'pull through' and the 'slow in' techniques. Basically, both involve tunneling through the ground and pulling long strings of pipe through the bore with very little disturbance of the ground at the surface. The principal pieces of equipment used on this job are the Badger Minor and the Tugmaster. The functions of these pieces are described and the two methods of pipe installation are explained.

PAVED WAY FOR TRANSOONA'S LONG HOLE.

Eng Contract Record, Vol 82, No 10, p 58-60, Oct 1969. 1 diag.

Descriptors: *Sewers, *Tunnels, *Tunneling, *Tunnel design, Planning, Construction.
Identifiers: *Storm sewer, Canada.

BACM Industries Ltd. in Winnipeg built the largest and longest sewer tunnel ever contracted in Manitoba. This storm relief project is described in a brochure they mailed to all residents in the area. The basic construction plan involved the sinking of 10 shafts to a depth of 34 feet at regular intervals, the sewer being tunnelled outward from each shaft and connected to form one long tunnel. The soft-mining method was employed, and no problems were encountered except for the high water table created during spring because of flooding conditions above ground. This was overcome by boxing off the area and using sump pumps to divert the water until workers were finished in that area. Tunneling procedures used are discussed, including the open cut method employed for a portion of the storm relief sewer.
W71-06976

THOMPSON RIVER MOLE BORE IS THE LONGEST IN HARD ROCK.

Eng News-Record, Vol 183, No 5, p 18, Jul 31, 1969.

Descriptors: *Tunneling, *Tunneling machines, *Tunnel design, *Construction equipment, *Tunnels.
Identifiers: *Mole, *Australia.

A 12-mile tunnel, which will divert water from the Thompson River through 3,600-ft Mount Gregory to the Yarra River, is a 24 million dollar project. The project has three stages: (1) excavation of the Thompson and Yarra adits (totaling 3,260 feet); (2) excavation of the 1,390 foot Easton adit, and a 2.9 mile section of the main tunnel between the Easton and Thompson adits; and (3) boring of the 9.1 mile main tunnel using the mole.

MOLE BREAKS THROUGH AFTER 293-FT. DAY AND 1,114-FT WEEK.

Eng News-Record, Vol 183, No 4, p 28-29, Jul 24, 1969.

Descriptors: *Bids, *Tunnel construction, *Tunneling machines, Tunnel design, Cost comparisons.
Identifiers: *Mole.

The Utah Construction and Mining Co.'s mole boring machine, called Jarva Mark 11-1200, averaged 109 feet per day at an estimated $15/ft. cutter cost. Remarks made by the project manager which encompass the operation of the mole and the construction design, are included. A cost comparison of the different contract bids is given.
W71-06978

PIPES JACKED BEHIND MINI-MOLE.

Eng News-Record, Vol 182, No 20, p 45-46, May 15, 1969.

Descriptors: *Sewers, *Cost comparisons, *Tunneling machines, *Tunneling.
Identifiers: *Mini Mole, *Chicago, *Mole.

A mining machine, which jacks concrete pipe sections immediately behind it, is being used to build a sewer in suburban Chicago. The technique, commonly used to avoid cut-and-cover construction across highways and railroads, entails building a two mile sanitary sewer under a $2.9 million contract. The procedure involved is explained, and a cost comparison study of mining and jacking the 66-inch diameter pipe into place, with a 78-inch-ID reinforced concrete sewer using conventional methods of machine mining, ribs, lagging and monolithically placed concrete, is given.

MODERN TUNNELING METHODS USED ON BOLTON SEWER.

Surveyor, Vol 85, No 4049, p 38, Jan 16, 1970. 1 fig.

Descriptors: *Tunneling, *Sewers, *Tunnel construction, *Tunnel design, *Tunneling machines.
Identifiers: *Great Britain.

Fifteen years ago, a Radcliff sewer connection by tunnel was more expensive than a riverside route on the surface. However, developments in tunneling made it possible for a tunnel route to provide savings over the sewer's probable life. So, a 3/4-mile long sewage tunnel was constructed. Blasting was used for the greater part of the length, and excavated materials were removed by means of an electrically-driven small gauge railway. Instead of employing compressed air for shaft sinking, a recently developed boring technique was used. The method is fully described along with other construction and installation procedures.

RECENT TUNNEL EXCAVATION WITH BORING MACHINES,
D. E. Cannon.
Civil Eng, Vol 37, No 8, p 45-48, Aug 1967. 3 tab.

Descriptors: *Tunneling machines, *Drilling, *Routing, *Rock excavation, *Tunneling.
Identifiers: *Mole, *Machine comparison.

Mole boring machines are making tunnel excavation records on the U.S. Bureau of Reclamation's San-Chama Project for additional water supply routes to Rocky Mountain cities of north central New Mexico. A series of three tunnels are required for this project. Geology reports indicated that the rock to be encountered--shale and sandstone--could be economically excavated by a mole. Drilling was performed from the surface along the tunnel alignments at roughly one mile intervals. A main concern was whether igneous dikes or sills existed at tunnel elevation which might preclude using a boring machine. Results of the exploration program were encouraging and did not indicate presence of igneous intrusions. Advantages cited of boring machines over concentional tunneling methods include: higher excavation rate, reduction in concrete needs, fewer personnel requirements, safer operations, reduction in required supports and in clean-up time. Disadvantages of mole boring include: high initial investment; long delivery period; restriction to softer rocks; and the requirement for a well maintained ventilation system, an accurate guidance system, and expert surveying technicians.

MOLE ANCHORS IN PILOT HOLE AND PULLS ITSELF AHEAD,
Michael Kolbenschlag.
Construct Methods Equip, Vol 52, No 4, p 87-88, 90-91, 94-95, Apr 1970. 5 fig.

Descriptors: *Tunneling machines, *Drilling, *Tunnels, *Drill holes.
Identifiers: *Mole, *Mole structure, Laser beam.

Instead of advancing by having the cutterhead jacked against the face, as most tunneling machines do, a Detroit hydraulic rig used a reverse technique. This mole drilled a pilot hole in the center of the face, locked in place an anchor concentric with the pilot-drill stem, and then pulled itself forward hydraulically against resistance of the anchor. The main cutterhead and pilot drill advanced simultaneously. Water and fault zones complicated early stages of work on the water tunnel, but the contractor hoped to make up time with the new method. Complete descriptions are given of the structure of the machine, mucking operations, laser guidance, and the mole's power source.
W71-06985

LASER BEAM ON MOLE SPEEDS SEWER WORK,
Alex Mair.
Eng Contract Record, Vol 83, No 2, p 44-45, Feb 1970.

Descriptors: *Instrumentation, *Tunneling machines, Tunneling, Operations.
Identifiers: *Mole, *Laser beam control.

A tunnel in Edmonton is being produced at an average of 120 ft/day. A tunnel mole and the use of a laser beam have hastened the procedure. The practical limit on the distance the beam can travel depends on two things: changes in direction of the line, and the amount of dust and fog in the air in the tunnel. The mole consists of a set of rotating arms with cutting teeth and a bucket wheel for catching the loosened material. The workings of the tunnel operation are given.
W71-06986

HYDRAULIC DESIGN OF UNLINED ROCK TUNNELS,
Skrikrishna V. Chitale, K. S. Rajagopalan, and David Ellis Wright.
J Hydraulics Div, Am Soc Civil Engrs, Vol 96, No HY4, p 1060-1065, Apr 1970. 1 fig, 3 ref.

Descriptors: *Rock properties, Hydraulic design, Roughness (Hydraulic).
Identifiers: *Unlined tunnels.

S.V. Chitale and K.S. Rajagopalan comment on Figures 2 and 3 of the original article. Fig. 2 shows a plot of resistance coefficients for unlined rock tunnels, and considerable scatter of data is apparent. The authors list reasons for this scatter. Fig. 3 gives tunnel overbreak for various tunnel sizes. The authors note the difficulty involved in using this figure to estimate overbreak depth because of the presence of considerable scatter, and they suggest a way to improve this situation. David Ellis Wright notes that progress will be made in designing unlined rock tunnels only if a critical comparison is made of results on prototype tunnels. He lists requirements to be satisfied in order that these results be of wider design use. He also defines terms such as tunnel size, overbreak, relative roughness, and equivalent sand grain diameter, which he uses in his commentary on the original paper. His comments include opinions on the resistance equation, the relation between resistance and roughness, partly-lined conduits, and data in Table 2 of the original paper.

8I. Fisheries Engineering

THE INFLUENCE OF ENGINEERING DESIGN AND OPERATION AND OTHER ENVIRONMENTAL FACTORS ON RESERVOIR FISHERY RESOURCES,
Bureau of Sport Fisheries and Wildlife, Fayetteville, Ark.
Robert M. Jenkins.
Water Resources Bulletin, Vol 6, No 1, p 110-119, January-February 1970. 10 p, 1 fig, 5 tab, 4 ref.

Descriptors: *Reservoir fisheries, *Water quality, *Environmental effects, Structural engineering, Design, Hydrologic aspects, Water chemistry, Fish management, Ecology, Dissolved solids, Water temperature, Sampling, Methodology, Test procedures, Evaluation, Fish reproduction, Aquatic environment, Reservoir operation.

The effect of selected reservoir environmental variables--including surface area, mean depth, outlet depth, thermocline depth, water level fluctuation, storage ratio, shore development, total dissolved solids, growing season and age of reservoir--on fish standing crop in 140 large impoundments has been explored through partial correlation and multiple regression analyses. The sample was partitioned into 25 subsamples based on reservoir use type, water exchange rate, thermocline formation and water chemistry. Fish standing crops were estimated by summer rotenone sampling of coves or open water areas enclosed by blockoff net. Logarithmic partial correlation revealed highly significant (0.01 confidence level) positive effects of outlet depth, shore development and dissolved solids on total standing crop in the entire sample. At the 0.20 confidence level, the crop of all sport fishes is positively influenced by outlet depth, storage ratio and shore development and negatively by mean depth. A morphoedaphic expression, total dissolved solids divided by mean depth, provides a useful index to reservoir fish production. The relationship is curvilinear, with maximum crops expected at index values of 5 to 30. The index accounts for 62 percent of the variability in hydropower storage reservoir crops. (Woodard-USGS)

09. MANPOWER, GRANTS AND FACILITIES

9C. Research Facilities

NATIONAL INSTITUTE OF ECOLOGY--AN OPERATIONAL PLAN.
Ecological Society of America.

December 1970. 42 p, 4 fig, 3 tab.

Descriptors: *Research facilities, *Project planning, *Organizations, *Institutions, Ecology, Social needs, Environment, Balance of nature, Biology, Financing, Planning, Federal budgets, Estimated costs, Programs, Professional societies, Technical societies, Facilities, Laboratories, Model studies, Analysis, Management, Research and development, Administration, Education, Social aspects, Political aspects.

The Ecological Society of America presents herein an organizational plan for a National Institute of Ecology. This proposed organization is designed to assemble multidisciplinary groups from existing ecological and scientific talents to work on major ecological and related questions. The Institute will perform five types of functions: (1) basic ecological research beyond the capacity of existing agencies; (2) conduct selected short-term projects in response to specific requests; (3) economic and social analysis focusing on environmental and resource management policy; (4) services to working ecologists, including analytical and modeling services, taxonomic support, and field facilities and installations; and (5) communication and education. The Institute will have a director appointed by a nine-member board of trustees elected for three-year overlapping terms. Trustees will be chosen by the Founding Institutions and an open Assembly representative of corporate groups and individuals. There will be a staff of forty persons which will increase to 150. Federal funding will be sought for the laboratory, equipment, and for BIOME modeling and synthesis. Federal and private funds will be sought for policy research, communication, and education. Costs of forecasting and planning will be met by contracting agencies. (Robinson-Florida)

Two principal functions of the University of Connecticut Water Resources Institute are to sponsor and coordinate research and to increase opportunities for the interdisciplinary approach both research and graduate training. This publication was prepared to show staff interests in the broad field of water resources. The information provided in this publication is based on responses to a questionnaire sent in February 1970 to all staff members of the University. The respondents represented 32 different departments or equivalent administrative units of the University. The information obtained was listed in the following categories: faculty conducting and/or interested in water resources research; faculty conducting water water resources research; faculty interested in but not currently conducting water resources research; summary of water resources research interests; summary of current water resources research; and summary of water resources research proposed or desired. ABSTRACTS OF PUBLICATIONS REPORTING RESULTS OF RESEARCH,
North Dakota Water Resources Research Institute, Fargo; and North Dakota Univ., Grand Forks.
Gary W. Paulson.
Available from National Technical Information Service as PB-198 426, $3.00 in paper copy, $0.95 in microfiche. North Dakota Water Resources Research Institute Report WI-110-001-71FCS X-C, February 1971. 54 p. OWRR Project A-999 N Dak (1).

Descriptors: *Abstracts, *Water resources research act, *North Dakota, *Universities, Contracts, Grants, Bibliographies, Publications, Research and development, Water resources development, Groundwater, Surface water, Seepage, Water quality, Erosion, Water conservation, Lakes, Water pollution effects.
Identifiers: *North Dakota State University, *University of North Dakota.

Abstracts are presented of publications reporting results of research on water problems to indicate what research has been completed in North Dakota, the objectives of the research, and the results and application of the research. These abstracts are intended to provide a reference source to research reports available from the North Dakota Water Resources Research Institute. Complete reports of all research described in the publication can be obtained by making inquiry to Dr. Dale O. Anderson, Director, Water Resources Research Institute, North Dakota State University, Fargo, North Dakota 58102. The abstracts are organized alphabetically by problem areas. The problem areas are consistent with the water resources research categories established by the Federal Council for Science and Technology. (Knapp-USGS)

10. SCIENTIFIC AND TECHNICAL INFORMATION

PHREATOPHYTES - A BIBLIOGRAPHY.
Water Resources Scientific Information Center, Washington, D.C.
For primary bibliographic entry see Field 03B.
W71-06596

ANNOTATED BIBLIOGRAPHY ON SNOW AND ICE PROBLEMS,
Toronto Univ., Ontario, Canada. Dept. of Geography.
For primary bibliographic entry see Field 02C.
W71-06719

URBAN ECONOMICS AND PLANNING, VOLUME I, A DDC BIBLIOGRAPHY.
Defense Documentation Center, Alexandria, Va.
For primary bibliographic entry see Field 04C.
W71-06777

ABSTRACTS OF PUBLICATIONS REPORTING RESULTS OF RESEARCH,
North Dakota Water Resources Research Inst., Fargo; and North Dakota Univ., Grand Forks.
For primary bibliographic entry see Field 09D.
W71-07051

SUBJECT INDEX

BATEMENT
ALKALINE SCALE ABATEMENT BY CARBON DIOXIDE INJECTION,
W71-06458 03A

BLATION
THE INFLUENCE OF THE RADIATION FACTOR ON THE GROWING AND SHRINKING OF GLACIERS,
W71-06935 02C

BSTRACTS
SEWERAGE AND SEWAGE TREATMENT,
W71-06897 05D

ABSTRACTS OF PUBLICATIONS REPORTING RESULTS OF RESEARCH,
W71-07051 09D

CCESS ROUTES
ARNOLD'S INN, INC V MORGAN (REQUIRED REMOVAL OF OBSTACLES TO RIPARIAN ACCESS).
W71-06589 06E

THE LAW RELATING TO ACCESS TO PUBLIC WATERS IN NEW HAMPSHIRE,
W71-06906 06E

CCRETION(LEGAL ASPECTS)
ANCONA REALTY CO V FRAZIER (OWNERSHIP OF ACCRETED ISLAND).
W71-06554 06E

CID MIEN WATER
SILICATE TREATMENT FOR ACID MAIN DRAINAGE PREVENTION,
SILICATE AND ALUMINA/SILICA GEL TREATMENT OF COAL REFUSE FOR THE PREVENTION OF ACID MINE DRAINAGE.
W71-07052 05D

CTIVATED CARBON
REUSE OF EFFLUENT FROM POLYESTER MANUFACTURING OPERATION,
W71-06961 05D

CTIVATED SLUDGE
NEW ACTIVATED SLUDGE PLANT TO SERVE THREE WARWICKSHIRE VILLAGES,
W71-06876 05D

DEN
GROUNDWATER IN THE ADEN SECTOR OF SOUTHERN ARABIA,
W71-07003 02F

DMINISTRATION
WATER AND RELATED LAND RESOURCES - STATE ADMINISTRATION, LEGISLATIVE PROCESS AND POLICIES IN MINNESOTA, 1970,
W71-06599 06E

GEOTHERMAL STEAM ACT OF 1970 (EXPLOITATION AND DEVELOPMENT OF GEOTHERMAL STEAM RESOURCES).
W71-06650 06E

SENATE REPORT RECOMMENDING PASSAGE OF A FEDERAL ENVIRONMENTAL EDUCATION ACT.
W71-06662 06E

MUNICIPALS WANT NEW CENTRAL BODY FOR WATER AND SEWAGE.
W71-06762 05G

AN EVALUATION OF THE PROVISIONS AND POLICIES OF THE OUTER CONTINENTAL SHELF LAND ACT,
W71-06916 06E

AN EXPLORATION OF COMPONENTS AFFECTING AND LIMITING POLICYMAKING OPTIONS IN LOCAL WATER AGENCIES PHASE II.
W71-07054 06E

DMINISTRATIVE AGENCIES
PROTECTION AND ENHANCEMENT OF ENVIRONMENTAL QUALITY.
W71-06604 06E

OUTDOOR RECREATION UNDER FEDERAL POWER ACT.
W71-06605 06E

PROTECTION AND CONSERVATION OF WILDLIFE.
W71-06617 06E

THE POLITICS OF WATER RESOURCE MANAGEMENT THROUGH ARIZONA WATER-RELATED REGULATORY AGENCIES,
W71-06618 06E

REORGANIZATION OF EXECUTIVE DEPARTMENTS TO COORDINATE FEDERAL ENVIRONMENTAL POLICIES.
W71-06682 06E

THE RESPONSIBILITY OF TREATMENT PLANT OPERATORS UNDER THE PORTER-COLOGNE WATER QUALITY CONTROL ACT,
W71-06766 05G

STATEMENT OF ASSEMBLYMAN GEORGE M BORG,
W71-06913 06E

PROSPECTS FOR METROPOLITAN WATER MANAGEMENT,
W71-07053 06E

DMIRALTY
ROBICHAUX V THERIOT (PROOF OF NAVIGABILITY AS A PREREQUISITE FOR APPLYING ADMIRALTY LAW).
W71-06591 06E

DSORPTION
ADSORPTION,
W71-06463 02D

THE RETENTION OF SELECTED RADIONUCLIDES FROM DILUTE SOLUTIONS BY PANAMANIAN CLAYS,
W71-06716 05B

AEDES CASPIUS
LABORATORY EVALUATION OF SOME ORGANOPHOSPHOROUS COMPOUNDS AGAINST THE LARVAE OF AEDES (O.) DETRITUS (HALIDAY), AEDES (O.) CASPIUS (PALLAS) AND CULEX PIPIENS L.
W71-06727 05C

AEDES DETRITUS
LABORATORY EVALUATION OF SOME ORGANOPHOSPHOROUS COMPOUNDS AGAINST THE LARVAE OF AEDES (O.) DETRITUS (HALIDAY), AEDES (O.) CASPIUS (PALLAS) AND CULEX PIPIENS L.
W71-06727 05C

AERATION
SEWAGE-TREATMENT PLANT,
W71-06898 05D

PILOT-PLANT STUDIES OF PROCESSING WASTES OF COTTON TEXTILES,
W71-06993 05D

AERIAL PHOTOGRAPHY
ON THE POSSIBILITY OF USING METEOROLOGICAL SATELLITE OBSERVATIONS FOR THE STUDY OF ANTARCTIC ICE,
W71-07023 07B

GLACIER SURVEYS IN BRITISH COLUMBIA 1968 VOLUME 1 - ENGLISH SYSTEM VOLUME 2 - METRIC SYSTEM,
W71-07037 02C

AEROMONAS LIQUEFACIENS
A POTENT CHEMOTHERAPEUTIC AGENT AGAINST FISH DISEASES 6-HYDROXY-METHYL-2-(2-(5-NITRO-2-FURYL) VINYL) PYRIDINE (P-7138),
W71-06728 05C

AFRICA
CONTINENTAL SHELF AND UPPER SLOPE SEDIMENTS OFF PORTUGESE GUINEA, GUINEA, AND SIERRA LEONE, WEST AFRICA,
W71-06988 02J

AGRICULTURAL LAND RUNOFF
TARGET DATES FOR SECONDARY TREATMENT AND STORMWATER SEPARATION ON LOWER MISSOURI AND MISSISSIPPI RIVERS,
W71-06744 05D

AGRICULTURE
INTRODUCTORY REMARKS,
W71-06811 05G

DESALTING SALINE WATER FOR IRRIGATION--A CASE STUDY--COACHELLA AREA,
W71-06833 03C

AGRICULTURE CONSERVATION PROGRAM
COST-SHARING UNDER THE AGRICULTURAL CONSERVATION PROGRAM,
W71-06827 05G

AIR DRILLING
GROUNDWATER PRODUCTION FROM THE BEDROCK OF SWEDEN,
W71-06923 08A

AIR TEMPERATURE
OROGRAPHIC TEMPERATURE INVERSION OF AIR IN EASTERN SIBERIA AND ITS ROLE IN THE FORMATION OF PERENNIALLY FROZEN ROCKS. (RUSSIAN OROGRAFICHESKAYA TEMPERATURNAYA INVERSIYA VOZHDUKA V VOSTOCHNOY SIBIRI I YEYE ROL' V FORMIROVANII MNOGOLETNEMERZLYKH GORNYKH POROD),
W71-06709 02C

AIRPORT DRAINAGE
HANDBOOK OF STEEL DRAINAGE AND HIGHWAY CONSTRUCTION PRODUCTS CHAPTER 11 - AIRPORT DRAINAGE.
W71-06648 08A

AIRPORTS
NATURAL RESOURCES PROTECTION STUDY.
W71-06780 06A

ALABAMA
MONITORING ECOLOGICAL CONDITIONS ASSOCIATED WITH WIDE-SCALE APPLICATIONS OF DMA 2,4-D TO AQUATIC ENVIRONMENTS,
W71-06462 05B

HYDROLOGY OF LIMESTONE TERRANES - GEOLOGIC INVESTIGATIONS,
W71-06518 02F

ALANINE
RELATIONS BETWEEN THE STRUCTURE OF CHLORAMPHENICOL AND ITS VEGETALIZING EFFECTS ON SEA URCHIN, PARACENTROTUS LIVIDUS, EGGS (IN FRENCH),
W71-06735 05C

ALASKA
GEOCHEMICAL AND GEOLOGICAL RECONNAISSANCE IN THE SEVENTYMILE RIVER AREA, ALASKA,
W71-06466 02J

ALASKA-TEN YEAR COMPREHENSIVE PLAN FOR CLIMATOLOGIC AND HYDROLOGIC DATA.
W71-06521 06B

ALBERTA(CANADA)

DISSOLVED, SUSPENDED AND BED LOAD MOVEMENT PATTERNS IN TWO O'CLOCK CREEK, ROCKY MOUNTAINS, CANADA, SUMMER, 1969,
W71-06473 02J

GLACIER SURVEY IN ALBERTA,
W71-07033 02C

ALGAE SCREENS
REUSE OF EFFLUENT FROM POLYESTER MANUFACTURING OPERATION,
W71-06961 05D

ALINEMENT
LASER ALIGNMENT TECHNIQUES IN TUNNELING,
W71-06842 08H

ALLUVIAL AQUIFERS
METHODS AND APPLICATIONS OF ELECTRICAL SIMULATION IN GROUNDWATER STUDIES IN THE LOWER ARKANSAS AND VERDIGRIS RIVER VALLEYS, ARKANSAS AND OKLAHOMA,
W71-06507 02F

ALLUVIAL CHANNELS
CONCEPT OF CRITICAL SHEAR STRESS IN LOOSE BOUNDARY OPEN CHANNELS,
W71-06482 08B

DEVELOPMENT OF A MEANDERING THALWEG IN A STRAIGHT, ERODIBLE LABORATORY CHANNEL,
W71-06485 08B

GEOLOGY, HYDROLOGY, AND GEOPHYSICS OF COLUMBIA SEDIMENTS IN THE MIDDLETOWN-ODESSA AREA, DELAWARE,
W71-06657 02J

PALEOFLOW CHARACTERISTICS OF A LATE CRETACEOUS RIVER IN UTAH FROM ANALYSIS OF SEDIMENTARY STRUCTURES IN THE PERRON SANDSTONE,
W71-06989 02J

AREAL SORTING OF BED-LOAD MATERIAL THE HYPOTHESIS OF VELOCITY REVERSAL,
W71-07009 02J

ALLUVIUM
CASE-HARDENING OF CARBONATE ALLUVIUM AND COLLUVIUM, SPRING MOUNTAINS, NEVADA,
W71-06996 02J

ALTERATION OF FLOW
DIVERSIONS AND ALTERATIONS OF STREAM FLOW,
W71-06905 06E

ALUMINA/SILICA GEL
SILICATE TREATMENT FOR ACID MAIN DRAINAGE PREVENTION, SILICATE AND ALUMINA/SILICA GEL TREATMENT OF COAL REFUSE FOR THE PREVENTION OF ACID MINE DRAINAGE.
W71-07052 05D

AMMONIA
THE LEVEL OF N-AMMONIA AND N-UREA IN THE BLOOD SERUM AND BRAIN OF HEALTHY AND AMMONIA-INTOXICATED CARPS (CYPRINUS CARPIO L) (IN CZECH),
W71-06732 05C

A COLORIMETRIC METHOD FOR AMMONIA IN NATURAL WATERS,
W71-07046 05A

AMMONIA DETERMINATION
A COLORIMETRIC METHOD FOR AMMONIA IN NATURAL WATERS,
W71-07046 05A

AMUR OBLAST(USSR)
SOIL MOISTURE TYPES OF THE AMUR OBLAST (RUSSIAN TIPY UVLAZHENNOSTI LANDSHAFTOV AMURSKOY OBLASTI),
W71-06710 02G

ANAEROBIC BACTERIA
SECONDARY TREATMENT OF HOG WASTE IN AN ANAEROBIC STABILIZATION POND,
W71-07055 05D

ANAEROBIC CONDITIONS
SECONDARY TREATMENT OF HOG WASTE IN AN ANAEROBIC STABILIZATION POND,
W71-07055 05D

ANAEROBIC DIGESTION
USE OF SOIL TO TREAT ANAEROBIC LAGOON EFFLUENT DESIGN AND OPERATION OF A FIELD DISPOSAL SYSTEM,
W71-06806 05D

INDIAN UTILIZES NOVEL MANURE DISPOSAL SYSTEM,
W71-06807 05D

ANALOG MODELS
GROUNDWATER FLOW IN HETEROGENEOUS, ANISOTROPIC FRACTURED MEDIA A SIMPLE TWO-DIMENSIONAL ELECTRIC ANALOG,
W71-06475 02F

METHODS AND APPLICATIONS OF ELECTRICAL SIMULATION IN GROUNDWATER STUDIES IN THE LOWER ARKANSAS AND VERDIGRIS RIVER VALLEYS, ARKANSAS AND OKLAHOMA,
W71-06507 02F

POTENTIAL DEVELOPMENT AND RECHARGE OF GROUNDWATER IN MILL CREEK VALLEY, BUTLER AND HAMILTON COUNTIES, OHIO, BASED ON ANALOG MODEL ANALYSIS,
W71-06509 02F

A SHORTCUT FOR COMPUTING STREAM DEPLETION BY WELLS USING ANALOG OR DIGITAL MODELS,
W71-07006 07C

ANALYSIS
STORM-WATER TANKS IN COMBINED SEWERAGE SYSTEMS,
W71-06532 05D

HANDBOOK OF STEEL DRAINAGE AND HIGHWAY CONSTRUCTION CHAPTER 1 - PRODUCT DETAILS.
W71-06640 08A

ANALYTICAL TECHNIQUES
ANALYTICAL PROCEDURES FOR MEASURING CHEMICALS IN THE PUBLIC HEALTH SERVICE DRINKING WATER STANDARDS, 1962,
W71-06765 05F

WATER RE-USE.
W71-06866 05D

ANIMAL POPULATIONS
EFFECTS OF THE HERBICIDE SILVEX ON BENTHOS OF A FARM POND,
W71-06739 05C

ANISOTROPY
GROUNDWATER FLOW IN HETEROGENEOUS, ANISOTROPIC FRACTURED MEDIA A SIMPLE TWO-DIMENSIONAL ELECTRIC ANALOG,
W71-06475 02F

ANTARCTIC
FORMATION OF ANTARCTIC BOTTOM WATER IN THE WEDDELL SEA,
W71-06469 02C

GEOMORPHOLOGY OF THE FILDES PENINSULA ON KING GEORGE (WATERLOO) ISLAND,
W71-07013 02J

RADAR SOUNDING OF ANTARCTIC GLACIERS IN THE SUMMER OF 1967/68,
W71-07014 02C

AMOUNT OF PRECIPITATION AND SNOW ACCUMULATION AT VOSTOK STATION,
W71-07015 02C

STUDY OF ICE MOVEMENT IN ENDERBY LAND IN 1967,
W71-07016 02C

SOME LIMNOLOGICAL OBSERVATIONS FROM ENDERBY LAND, ANTARCTICA,
W71-07017 02H

STUDY OF LAKES IN THE VICINITY OF MOLODEZHNAYA STATION,
W71-07018 02H

CHEMISTRY OF WATER, ICE, AND SNOW IN THE SCHIRMACHER PONDS,
W71-07019 02H

PROBLEM OF THE AMOUNT OF SNOW ACCUMULATING IN CENTRAL ANTARCTICA,
W71-07020 02C

TEMPERATURE REGIME OF THE CONTINENTAL ICE SHEET IN ENDERBY LAND,
W71-07021 02C

ON THE POSSIBILITY OF USING METEOROLOGICAL SATELLITE OBSERVATIONS FOR THE STUDY OF ANTARCTIC ICE,
W71-07023 07B

ANTARCTIC ICE
ON THE POSSIBILITY OF USING METEOROLOGICAL SATELLITE OBSERVATIONS FOR THE STUDY OF ANTARCTIC ICE,
W71-07023 07B

ANTARCTICA
GEOMORPHOLOGY OF THE FILDES PENINSULA ON KING GEORGE (WATERLOO) ISLAND,
W71-07013 02J

RADAR SOUNDING OF ANTARCTIC GLACIERS IN THE SUMMER OF 1967/68,
W71-07014 02C

AMOUNT OF PRECIPITATION AND SNOW ACCUMULATION AT VOSTOK STATION,
W71-07015 02C

STUDY OF ICE MOVEMENT IN ENDERBY LAND IN 1967,
W71-07016 02C

SOME LIMNOLOGICAL OBSERVATIONS FROM ENDERBY LAND, ANTARCTICA,
W71-07017 02H

STUDY OF LAKES IN THE VICINITY OF MOLODEZHNAYA STATION,
W71-07018 02H

CHEMISTRY OF WATER, ICE, AND SNOW IN THE SCHIRMACHER PONDS,
W71-07019 02H

PROBLEM OF THE AMOUNT OF SNOW ACCUMULATING IN CENTRAL ANTARCTICA,
W71-07020 02C

TEMPERATURE REGIME OF THE CONTINENTAL ICE SHEET IN ENDERBY LAND,
W71-07021 02C

SNOW ACCUMULATION BETWEEN MOLODEZHNAYA STATION AND THE 200-KM MARK,
W71-07022 02C

W71-07022 02C

PLICATION METHODS
STORM-WATER TANKS IN COMBINED SEWERAGE SYSTEMS,
W71-06530 05D

HANDBOOK OF STEEL DRAINAGE AND HIGHWAY CONSTRUCTION PRODUCTS.
W71-06639 08A

WASTE DISPOSAL--WATER TREATMENT PLANTS (JOINT DISCUSSION).
W71-06846 05E

WATER RE-USE.
W71-06866 05D

PRAISALS
WATER FOR INDUSTRIAL DEVELOPMENT IN AMITE, FRANKLIN, LINCOLN, PIKE, AND WILKINSON COUNTIES, MISSISSIPPI,
W71-06510 03E

UATIC PRODUCTIVITY
EFFECTS OF THE HERBICIDE SILVEX ON BENTHOS OF A FARM POND,
W71-06739 05C

UICULTURE
A POTENT CHEMOTHERAPEUTIC AGENT AGAINST FISH DISEASES 6-HYDROXY-METHYL-2-(2-(5-NITRO-2-FURYL) VINYL) PYRIDINE (P-7138),
W71-06728 05C

UIFER CHARACTERISTICS
GROUNDWATER FLOW IN HETEROGENEOUS, ANISOTROPIC FRACTURED MEDIA A SIMPLE TWO-DIMENSIONAL ELECTRIC ANALOG,
W71-06475 02F

HYDRAULIC FRACTURING,
W71-06950 08B

UIFERS
GEOHYDROLOGY OF THE SHALLOW AQUIFERS OF BATON ROUGE, LOUISIANA,
W71-06505 02F

GEOHYDROLOGIC SIGNIFICANCE OF LITHOFACIES OF THE COCKFIELD FORMATION OF LOUISIANA AND MISSISSIPPI AND OF THE YEGUA FORMATION OF TEXAS,
W71-06519 02F

AVAILABILITY OF WATER IN THE MISSISSIPPI EMBAYMENT,
W71-06520 02F

GEOLOGY, HYDROLOGY, AND GEOPHYSICS OF COLUMBIA SEDIMENTS IN THE MIDDLETOWN-ODESSA AREA, DELAWARE,
W71-06657 02J

WATER RESOURCES OF RACINE AND KENOSHA COUNTIES, SOUTHEASTERN WISCONSIN,
W71-06696 02E

ABIA
GROUNDWATER IN THE ADEN SECTOR OF SOUTHERN ARABIA,
W71-07003 02F

CH DAMS
EARTHQUAKE RESPONSE OF ARCH DAMS,
W71-06843 08A

CTIC OCEAN
THE EFFECT OF METEORIC WATER, MELT WATER AND BRINE ON THE COMPOSITION OF POLAR SEA WATEP AND OF THE DEEP WATERS OF THE OCEAN,
W71-06688 02K

IZONA
WILDLIFE VERSUS IRRIGATION,
W71-06465 03B

STREAMFLOW IN THE UPPER SANTA CRUZ RIVER BASIN, SANTA CRUZ AND PIMA COUNTIES, ARIZONA,
W71-06502 02E

THE POLITICS OF WATER RESOURCE MANAGEMENT THROUGH ARIZONA WATER-RELATED REGULATORY AGENCIES,
W71-06618 06E

RKANSAS
METHODS AND APPLICATIONS OF ELECTRICAL SIMULATION IN GROUNDWATER STUDIES IN THE LOWER ARKANSAS AND VERDIGRIS RIVER VALLEYS, ARKANSAS AND OKLAHOMA,
W71-06507 02F

HOGGE V DRAINAGE DIST NO 7 (DRAINAGE DISTRICT'S LIABILITY FOR FLOODING LAND OUTSIDE DISTRICT).
W71-06593 06E

RKANSAS RIVER VALLEY
METHODS AND APPLICATIONS OF ELECTRICAL SIMULATION IN GROUNDWATER STUDIES IN THE LOWER ARKANSAS AND VERDIGRIS RIVER VALLEYS, ARKANSAS AND OKLAHOMA,
W71-06507 02F

RTIFICALLY FROZEN SOILS
PROBLEMS IN THE THEORY AND PRACTICE OF ARTIFICIAL FREEZING OF SOIL,
W71-06791 08D

SSESSMENTS
A SIMULATION TECHNIQUE FOR ASSESSING STORM AND COMBINED SEWER SYSTEMS,
W71-06746 05G

ATLANTIC OCEAN
SURFACE SALINITY ALONG THE EAST COAST OF THE UNITED STATES,
W71-06687 02L

ATMOSPHERE
TRITIUM LOSS FROM WATER EXPOSED TO THE ATMOSPHERE,
W71-06456 02K

AUSTRALIA
THOMPSON RIVER MOLE BORE IS THE LONGEST IN HARD ROCK.
W71-06977 08H

AUTOMATIC IRRIGATION EQUIPMENT
MECHANIZED SURFACE IRRIGATION SYSTEMS FOR ROLLING LANDS,
W71-07050 03F

AUTOMATION
AN AUTOMATIC RECORDING FIELD STATION FOR COLLECTING ENVIRONMENTAL DATA,
W71-06467 07C

MECHANIZED SURFACE IRRIGATION SYSTEMS FOR ROLLING LANDS,
W71-07050 03F

BACKWATER
RIVER-COAST INTERACTION LABORATORY SIMULATION,
W71-06697 02J

BACTERIA
HEALTH PROBLEMS,
W71-06813 05G

DON'T POLLUTE A CLEAN RESERVOIR.
W71-06943 05B

SECONDARY TREATMENT OF HOG WASTE IN AN ANAEROBIC STABILIZATION POND,
W71-07055 05D

BACTERICIDES
A POTENT CHEMOTHERAPEUTIC AGENT AGAINST FISH DISEASES 6-HYDROXY-METHYL-2-(2-(5-NITRO-2-FURYL) VINYL) PYRIDINE (P-7138),
W71-06728 05C

DON'T POLLUTE A CLEAN RESERVOIR.
W71-06943 05B

BADGER MINOR
PIPELAYER MINIMIZES TRENCHING AND BACKFILLING.
W71-06974 08H

BAFFIN BAY
THE EFFECT OF METEORIC WATER, MELT WATER AND BRINE ON THE COMPOSITION OF POLAR SEA WATER AND OF THE DEEP WATERS OF THE OCEAN,
W71-06688 02K

BAFFIN ISLAND(CANADA)
APPLICATIONS OF INFORMATION AND GRAPH THEORY TO MULTIVARIATE GEOMORPHOLOGICAL ANALYSES,
W71-06486 07C

BALANCE OF NATURE
PROTECTION AND ENHANCEMENT OF ENVIRONMENTAL QUALITY.
W71-06604 06E

BALTIC SEA
ON THE STAGNATION AND RECENT TURNOVER OF THE WATER IN THE BALTIC,
W71-06498 05C

BASINS
AVERAGE ANTECEDENT TEMPERATURES AS A FACTOR IN PREDICTING RUNOFF FROM STORM RAINFALL,
W71-06967 02A

BATON ROUGE(LA)
GEOHYDROLOGY OF THE SHALLOW AQUIFERS OF BATON ROUGE, LOUISIANA,
W71-06505 02F

BAYESIAN THEORY
ERROR ANALYSIS AND SYSTEM IDENTIFICATION OF WATER BALANCE AND THE RAINFALL EXCESS COMPONENT IN REAL AND MODEL WATERSHEDS,
W71-06578 06A

BAYS
DRAINAGE AREA STATISTICS FOR THE CHESAPEAKE BAY FRESH-WATER DRAINAGE BASIN,
W71-06668 02E

BEACH ROCK CEMENTATION
FLORIDA BEACHES AND CEMENTED WATER-TABLE ROCKS,
W71-07049 02J

BEACHES
THE DECOMPOSITION OF CRUDE OIL RESIDUES IN SAND COLUMNS,
W71-06492 05B

RECOGNITION OF BARRIER ENVIRONMENTS,
W71-07025 02J

MEASUREMENT OF SHEAR STRESS AND ROUGHNESS LENGTH ON A BEACH,
W71-07028 02J

A TIME SERIES FROM THE BEACH ENVIRONMENT - II,
W71-07047 02J

FLORIDA BEACHES AND CEMENTED WATER-TABLE ROCKS,
W71-07049 02J

BED LOAD
CONCEPT OF CRITICAL SHEAR STRESS IN LOOSE BOUNDARY OPEN CHANNELS,
W71-06482 08B

SEDIMENT TRANSPORTATION MECHANICS H. SEDIMENT DISCHARGE FORMULAS.
W71-06483 02J

BASIC SEDIMENTATION PROBLEMS,
W71-06676 02J

LIFT FORCES ON SUSPENDED SEDIMENT PARTICLES IN LAMINAR FLOW EXPERIMENTS AND SEDIMENTOLOGICAL INTERPRETATION,
W71-06998 02J

RELATIONSHIP BETWEEN GRAIN SIZE PARAMETER DISTRIBUTION AND CURRENT PATTERNS IN THE GIRONDE ESTUARY (FRANCE),
W71-07001 02L

AREAL SORTING OF BED-LOAD MATERIAL THE HYPOTHESIS OF VELOCITY REVERSAL,
W71-07009 02J

BEHAVIOR ADAPTATIONS
THE COMPATIBLE EXISTENCE OF NON TARGET SPECIES TO PESTICIDES,
W71-06741 05C

BENTHIC FAUNA
EFFECTS OF THE HERBICIDE SILVEX ON BENTHOS OF A FARM POND,
W71-06739 05C

BENTHIC FLORA
A LABORATORY METHOD FOR THE STUDY OF MARINE BENTHIC DIATOMS,
W71-06723 05C

BENZENE
CONTROL OF OYSTER DRILLS, EUPLEURA CAUDATA AND UROSALPINX CINEREA, WITH THE CHEMICAL POLYSTREAM,
W71-06726 05C

BIBLIOGRAPHIES
PHREATOPHYTES - A BIBLIOGRAPHY.
W71-06596 03B

ANNOTATED BIBLIOGRAPHY ON SNOW AND ICE PROBLEMS,
W71-06719 02C

HYDROLOGY ANNUAL NO 14 - 1966.

CENTERS OF COMPETENCE AND THEIR SUBJECT COVERAGE

- Ground and surface water hydrology at the Water Resources Division of the U. S. Geological Survey, U. S. Department of the Interior.
- Metropolitan water resources management at the Center for Urban Studies of the University of Chicago.
- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Research Institute of Rutgers University.
- Design and construction of hydraulic structures; weather modification; and evaporation control at the Bureau of Reclamation, Denver, Colorado.
- Eutrophication at the Water Resources Center of the University of Wisconsin, jointly sponsored by the EPA-Water Quality Office, Soap and Detergent Association, and the Agricultural Research Service.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.
- Water well construction technology at the National Water Well Association.

Supported by the Environmental Protection Agency in cooperation with WRSIC.

- Thermal pollution at the Department of Sanitary and Water Resources Engineering of Vanderbilt University.
- Textile wastes pollution at the School of Textiles of North Carolina State University.
- Water quality requirements for freshwater and marine organisms at the College of Fisheries of the University of Washington.
- Wastewater treatment and management at the Center for Research in Water Resources of the University of Texas.
- Agricultural livestock wastes at the Department of Agricultural Engineering of Iowa State University.
- Methods for chemical and biological identification and measurement of pollutants at the Analytical Quality Control Laboratory of the Water Quality Office of the Environmental Protection Agency.
- Coastal pollution at the Oceanic Research Institute.

SELECTED WATER RESOURCES ABSTRACTS

THE LIBRARY OF THE
DEC 3 1971
UNIVERSITY OF ILLINOIS
AT URBANA-CHAMPAIGN

VOLUME 4, NUMBER 14
JULY 15, 1971

W71-07059 -- W71-07701

SELECTED WATER RESOURCES ABSTRACTS is published semimonthly for the Water Resources Scientific Information Center (WRSIC) by the National Technical Information Service (NTIS), U.S. Department of Commerce. NTIS was established September 2, 1970, as a new primary operating unit under the Assistant Secretary of Commerce for Science and Technology to improve public access to the many products and services of the Department. Information services for Federal scientific and technical report literature previously provided by the Clearinghouse for Federal Scientific and Technical Information will now be provided by NTIS.

SELECTED WATER RESOURCES ABSTRACTS is available to Federal agencies, contractors, or grantees in water resources upon request to: Manager, Water Resources Scientific Information Center, Office of Water Resources Research, U.S. Department of the Interior, Washington, D. C. 20240.

SELECTED WATER RESOURCES ABSTRACTS is also available on subscription from the National Technical Information Service. Annual subscription is $22 (domestic), $27.50 (foreign), single copy price $3. Certain documents abstracted in this journal can be purchased from the NTIS at prices indicated in the entry. Prepayment is required.

SELECTED
WATER RESOURCES ABSTRACTS

'A Semimonthly Publication of the Water Resources Scientific Information Center,
Office of Water Resources Research, U.S. Department of the Interior

VOLUME 4, NUMBER 14
JULY 15, 1971

W71-07059 -- W71-07701

Use of funds for printing this publication approved by the Director of the Bureau of the Budget, September 4, 1968.

As the Nation's principal conservation agency, the Department of the Interior has basic responsibilities for water, fish, wildlife, mineral, land, park, and recreational resources. Indian and Territorial affairs are other major concerns of America's "Department of Natural Resources."

The Department works to assure the wisest choice in managing all our resources so each will make its full contribution to a better United States—now and in the future.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifiers which are listed in the **Water Resources Thesaurus** (November 1966 edition). Each abstract entry is classified into ten fields and sixty groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

WRSIC IS NOT PRESENTLY IN A POSITION TO PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas.

Additional "centers of competence" have been established in cooperation with the Environmental Protection Agency, Water Quality Office. A directory of the Centers appears on inside back cover.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Resources Research and other Federal water resources agencies with which the Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangements of this bulletin are welcome.

SUBJECT FIELDS AND GROUPS

(Use Edge Index on back cover to Locate Subject Fields and Indexes in the journal.)

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Non-Water Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

SELECTED WATER RESOURCES ABSTRACTS

01. NATURE OF WATER

1A. Properties

NOMALOUS WATER, POROUS GLASS AND ILICIC ACID,
Department of Energy, Mines and Resources, Ottawa (Ontario). Inland Waters Branch.
V. A. Adams, M. K. Gabe, P. G. Manning, S. H. Whitlow, and J. D. Kingham.
ature Physical Science, Vol 230, No 2, p 39-40, Mar 8, 1971. 2 p, 1 fig, 1 tab, 12 ref.

escriptors: *Water chemistry, *Water properties, Gels, *Water structures, *Silica, Laboratory tests, est procedures, Investigations, Pollutants.
dentifiers: *Anomalous water, *Polywater, Porous ass, Silicic acid.

nomalous water formation in capillaries of 100 icrons suggests that a high surface to volume ratio necessary. The apparatus used incorporated orous Vycor glass and produced water with solid odies when the water was concentrated. The ycor is primarily composed of silica (96%). Oranic impurities in the Vycor were burned off by eating at 550 deg C in oxygen, and the assembled pparatus was evacuated overnight. A 1,000 watt uartz iodide lamp was used to irradiate the cell ecause it was felt that strong irradiation would nhance surface reactions; the temperature of the ycor glass was approximately 100 deg C during e experiments. Water diffusing through the ycor glass leaches out cations from the glass at e very high pressures within the micropores. The olume of condensate decreased by two-thirds hen desiccated for two days and the volume of the olid bodies which appeared was approximately 1% the volume of liquid collected. X-ray diffraction notographs and the absence of extinction in olarized light suggested that the solids were norphous. Observations suggest that anomalous ater is probably a silicic acid solution. ON PAIRING IN 2:2 COMPLEX ION ELECROLYTES: (Co (NH3)5NO2)SO4,
onnecticut Univ., Storrs. Dept. of Chemistry.
. L. Masterton, and Thomas Bierly.
urnal of Physical Chemistry, Vol 74, No 1, p 139-3, Jan 8, 1970. 5 p, 2 tab, 18 ref. OWRR Project -013-CONN (5).

escriptors: *Ionization, *Electrolytes, *Conducity, *Aqueous solutions, Mathematical studies, quations, Cobalt, Sulfates, Ions, Evaluation.
entifiers: *Fuoss theory, *Ion pairing.

onductivity data are reported for aqueous solutions of (Co (NH3)5NO2)SO4 in the concentran range 0.0004 to 0.001. The Shedlovsky ethod was used to calculate an ion pair dissociaon constant of 0.0025. The pK value (2.60) is sigficantly larger than those of simple 2:2 sulfates, rresponding to greater association. This effect s been noted previously with salts of lower arge types. A comparison of observed pK values th those calculated using the Fuoss theory of ionir formation suggests that nonelectrostatic forces e of major importance in 2:1 and, particularly, in l coordination compounds. POLYWATER ON SILICA-FREE SUBSTRATES,
Commonwealth Scientific and Industrial Research Organization, Ryde (Australia). Div. of Food Preservation.
J. Middlehurst, and L. R. Fisher.
Nature, Vol 230, No 5296, p 575, Apr 30, 1971. 1 p, 1 fig, 14 ref.

Descriptors: *Water chemistry, *Chemical properties, *Water types, *Water properties, *Silica, Analytical techniques, Water structure, X-ray diffraction, Gels.
Identifiers: *Polywater, *Anomalous water.

Experiments using semiconductor grade, single crystal silicon, 'Irtran-2' (sintered polycrystalline zinc sulphide), silver chloride, and fused silica ('Infrasil') gave no detectable product. But after 3 days at 97% relative humidity, magnesium oxide single crystals (99.95% pure, artificially grown periclase (Spicer)) became covered with a surface layer of a translucent substance approximately 2 micrometers thick. The infrared spectrum of this material, both on the periclase surface and on a calcium fluoride surface, after transfer by scraping with a barium fluoride crystal, was similar to that of the polywater prepared by Lippincott, et al., together with a small proportion of normal water. 02. WATER CYCLE

2A. General

OPSET: PROGRAM FOR COMPUTERIZED SELECTION OF WATERSHED PARAMETER VALUES FOR THE STANFORD WATERSHED MODEL,
Kentucky Water Resources Inst., Lexington.
Earnest Y. Liou.
Available from the National Technical Information Service as PB-198 442, $3.00 in paper copy, $0.95 in microfiche. Water Resources Institute Research Report No 34, 1970. 299 p, 10 fig, 26 tab, 26 ref, 3 append. OWRR Project C-1282 (No 1964) (3).

Descriptors: *Computer models, *Hydrologic budget, *Streamflow, Flood control, Hydrographs, Infiltration, Parametric hydrology, Runoff, Surface runoff, Watersheds (Basins).
Identifiers: *Stanford Watershed Model.

The Stanford Watershed Model uses a hydrologic budget to model the land phase of the hydrologic cycle and thereby simulate streamflow on a continuous basis from climatological data and watershed parameters. Values for key parameters are estimated by trial-and-error. Subjective estimating differences have made it difficult to correlate parameter values with known physical characteristics of the watershed. This study sought to computerize a parameter optimization procedure based on the FORTRAN version of the Stanford Watershed Model known as the Kentucky Watershed Model. The resultant self-calibrating watershed model is named OPSET because it determines an optimum set of parameter values by matching synthesized flows with recorded flows. The first step in program development used sensitivity studies to determine which watershed parameter values are critical in simulating flow and are difficult to measure directly. The second step was to adjust estimates of the selected parameters in a way systematically improving flow simulation until the best possible matching is achieved. Independent adjustment schemes were used for parameters associated with runoff volumes, recession flows, and flood hydrographs. The third step was to empirically improve the model by applying it to a number of watersheds in Kentucky. OPSET estimates watershed parameters on a one water year basis, and values best describing watershed characteristics should be averaged from several OPSET-selected one-year-based values. See also W71-07062 andW71-07063) (James-Georgia Tech)
W71-07061

THE STANFORD WATERSHED MODEL: THE CORRELATION OF PARAMETER VALUES SELECTED BY A COMPUTERIZED PROCEDURE WITH MEASURABLE PHYSICAL CHARACTERISTICS OF THE WATERSHED,
Kentucky Water Resources Inst., Lexington.
Glendon A. Ross.
Available from the National Technical Information Service as PB-198 443, $3.00 in paper copy, $0.95 in microfiche. Water Resources Institute Research Report No 35, 1970. 178 p, 22 fig, 28 tab, 67 ref, 2 append. OWRR Project C-1282 (No 1964) (4).

Descriptors: *Streamflow, *Urbanization, *Watersheds (Basins), Computer models, Infiltration, Surface runoff, Watershed management.
Identifiers: *Stanford Watershed Model.

Streamflow simulation provides a powerful tool for developing better information on flow magnitudes and time patterns for the design of water resources projects. A self-calibrating simulation model was applied to about 20 Kentucky watersheds and successfully used to estimate appropriate values for model parameters. The procedure required to develop the necessary input data is explained in sufficient detail to essentially by a users' manual for the program. Physical descriptions of the watersheds are presented, and a number of key watershed characteristics (soil depth, permeability, cover, etc.) were measured. Relationships between model parameters (based on the Stanford Watershed Model) and watershed characteristics were explored. Those which are most promising in estimating parameter values for use in modeling streamflow from ungaged watersheds are presented. Parameter values were also estimated for a series of years spanning a period of intensive urbanization, and statistically significant trends were noted. The results provide framework for modeling changes in streamflow magnitudes and time patterns associated with urban development. (See also W71-07061 and W71-07063) (James-Georgia Tech)
W71-07062

AN EVALUATION OF RELATIONSHIPS BETWEEN STREAMFLOW PATTERNS AND WATERSHED CHARACTERISTICS THROUGH THE USE OF OPSET: A SELF CALIBRATING VERSION OF THE STANFORD WATERSHED MODEL,
Kentucky Water Resources Inst., Lexington.
L. Douglas James.
Available from the National Technical Information Service as PB-198 444, $3.00 in paper copy, $0.95 in microfiche. Water Resources Institute Research Report No 36, 1970. 117 p, 2 fig, 21 tab, 48 ref. OWRR Project C-1282 (No 1964) (5).

Descriptors: *Flood control, *Flood damage, *Streamflow, *Watersheds (Basins), Computer models, Land use, Non-structural alternatives, Runoff, Surface runoff, Urbanization, Watersheds (Basins).
Identifiers: *Stanford Watershed Model.

More informed selection among alternative flood control measures requires better information on marginal differences in flood hazard associated with marginal differences in tributary watershed characteristics. Hydrologic modeling is the most promising approach to answering this question; however, the use of existing models is hampered by the absence of information correlating model parameters with physical characteristics of the watershed. To deal with this situation, a method was developed for estimating the parameter values for the Stanford Watershed Model which best match recorded with simulated streamflows. Physical characteristics were measured for 17 rural watersheds. Correlations between the characteristics and the parameters were examined. Changes in parameter values with urbanization were also examined. The results were used to study variations in downstream flood peaks and in average annual flood damages associated with various tributary watershed characteristics. The end product is designed to help guide urban develop-

ment to minimize flood damage and storm drainage cost. (See also W71-07061 andW71-07062) (James-Georgia Tech)

SUMMARY AND EVALUATION OF METHODS FOR DETECTING HYDROLOGIC CHANGES,
Agricultural Research Service, Athens, Ga. Southwest Watershed Research Center.
Willard M. Snyder.
Journal of Hydrology, Vol 12, No 4, p 311-338, Mar 1971. 28 p, 4 fig, 6 tab, 31 ref.

Descriptors: *Model studies, *Mathematical models, *Rainfall-runoff relationships, *Reviews, *Hydrologic equation, Systems analysis, Streamflow forecasting, Statistical methods, Linear programming, Regression analysis, Data processing, Runoff.
Identifiers: *Hydrologic change.

Methods for detection of hydrologic change were summarized on broad lines by classifying hydrologic data as statistical variates with definite statistical properties. The number of variates is controlled by available data, by the experimental design, and by the nature of the statistical test to be performed. The hydrologic variates may or may not be independent of each other, and they may or may not be serially independent in time. The number of variables in the test and their properties of independence control the analytical model used for testing a null hypothesis of change. The models treated in this paper are regression-discriminant models using time as a parametric expression of change. Of the models presented in this paper, only those intended for linear relationships of independent variates are considered well founded in both theory and practice. Many of the models are intended only for statistical discrimination between sets of hydrologic data. Models designed for detection of hydrologic change are probably not good representations of watershed systems. (Knapp-USGS)
W71-07271

STOCHASTIC SIMULATION OF MONTHLY STREAMFLOW BY A MULTIPLE REGRESSION MODEL UTILIZING PRECIPITATION DATA,
Nevada Univ., Reno. Desert Research Inst.
Jochanan Bonne.
Journal of Hydrology, Vol 12, No 4, p 285-310, Mar 1971. 26 p, 11 fig, 4 tab, 13 ref. OWRR Project A-026-NEV (3).

Descriptors: *Simulation analysis, *Rainfall-runoff relationships, *Stochastic processes, *Regression analysis, Systems analysis, Data collections, Data processing, Parametric hydrology, Mathematical models, Rainfall disposition, Computer programs, Markov processes.
Identifiers: *Stochastic models, *Operational hydrology.

A model for simulation of monthly streamflow series was developed by a multiple regression approach, which includes both precipitation and flow. The variables in the regression function represent the previous month's precipitation, antecedent month's precipitation, and the accumulated precipitation as independent variables, while the dependent variable is the current streamflow. A procedure is given for generating precipitation data. The frequency distribution of the flow record in each month is determined by statistical analysis. These monthly distributions are later imposed on the model in order to reproduce data with the same statistical parameters and distributions. Variables for the regression model are selected according to least variance, largest coefficient of determination, and the results of significance tests. Streamflows were simulated for 3 basins and results were compared with the historic record in terms of statistical parameters and frequency distribution. Results in general show good agreement with the historical data, mainly in terms of mean, standard deviation, and frequency distribution. Poorer agreement was found in the case of the less reliable parameters like skew coefficient and serial correlation. (Knapp-USGS)
W71-07334

MEAN ANNUAL RAINFALL/RUN-OFF RELATIONSHIP,
L. H. Young.
J Ind Water Engrs, Vol 24, No 7, p 423-430, Oct 1970. 1 fig, 3 tab.

Descriptors: *Rainfall-runoff relationships, *Cities, Analysis, Water loss.
Identifiers: *Urban hydrology.

World wide data are analyzed to investigate the relationship between the mean annual runoff, rainfall, and temperature of cities. Other parameters considered are found to have little independent effect. For non-arid climates the relationship is a straight line for which the slope is unity for 50 degrees F, steeper for lower temperatures, and flatter for higher temperatures. Water loss is found to be independent of rainfall only in the region of 50 degree F. A general runoff formula is developed for the overseas data, and a separate formula for the British Isles.
W71-07512

A DETAILED ANALYSIS OF CLIMATOLOGICAL AND HYDROLOGICAL RECORDS OF SOUTH FLORIDA WITH REFERENCE TO MAN'S INFLUENCE UPON ECOSYSTEM EVOLUTION,
Rosenstiel School of Marine and Atmospheric Sciences, Miami, Fla.
Thomas M. Terence.
Technical Report, 70-2, Oct 1970. 111 p, 34 fig, 12 tab, 33 ref. US National Park Service Contract DI-NPS-14-10-1-160-18.

Descriptors: *Ecosystems, *Climatology, *Hydrology, *Rainfall, *Water levels, *Water table, *Sea level, *Salinity, Florida.

Man's colonization of Southern Florida over the last 100 years and his influence upon the natural ecological environment has been well documented. Changes in the level of the fresh water table due to this influence, the rise in sea level due to deglaciation, and the changes in estuarine and near shore salinities are considered. Through modifications of the major natural resource, water, the rate of ecological change is 100 times as fast as if it had evolved naturally and the result has been that of ecosystem destruction. This study is of the fundamental parameters upon which other more detailed studies for environmental planning might be based. (Ensign-PAI)

HURRICANE BEULAH. A REPORT IN RETROSPECT ON THE HURRICANE AND ITS EFFECT ON BIOLOGICAL PROCESSES IN THE RIO GRANDE VALLEY, TEXAS,
Department of Agriculture, Gainesville, Fla. Biology Research Lab.
N. E. Flitters.
International Journal of Biometeorology, Vol 14, No 3, p 219-226, 1970. 2 fig, 5 ref.

Descriptors: *Hurricanes, *Atmospheric pressure *Rainfall, *Animal behavior, *Metabolism Semiarid climates, Texas, Rio Grande, Environmental effects, Flood damage, Ecology, Climati data, Citrus fruits, Plant growth, Winds, Anima populations, Insects.
Identifiers: *Rio Grande Valley.

On 20 September, 1967, Hurricane Beulah, wit winds of 94.7-113 knots and a barometric pressur of 951.5 mb, struck Brownsville, Texas, movin northwestward over southern Texas. In the follow ing 4 days, torrential rains fell, totalling almost 7 cm in some areas. Over 8000 people were injure and more than 2 billion dollars worth of propert was destroyed. The author was at the Entomolog Research Center in Brownsville during the hu ricane and was able to observe the caged insects the center before and during the hurricane, an wild populations of animals and plants after th worst of the hurricane. The Laboratory insec were hyperactive during the hurricane and it is su gested that this phenomenon results solely fro metabolic changes induced by changes in a mospheric pressure. Insect populations normall increase greatly after such torrential rains and th was confirmed by such increases about 3 wee after Beulah. Probably the climatic changes resul ing from the storm were sufficient to trigg presumably arrested advanced developmen Among birds, robins, jackdaws, sparrows and dov suffered the greatest mortality. When the sun rea peared, many passing and rarely-seen species we observed in food searching activity. Many plan were shorn of their folliage, but in the warm sunn period following the hurricane they began ne growth, which conceivably resulted from th breaking of dormancy by the climatic change Citrus fruits were especially hard hit in the R Grande Valley, with trees destroyed and skin frui ruptured. ASCE National Water Resources Meetin Phoenix, Arizona, Jan 11-15, 1971. Meetin Preprint 1330. American Society of Civil E gineers, Jan 1971. 30 p, 12 fig, 7 tab, 11 ref. Pric $0.50.

Descriptors: *Thunderstorms, *Storm structur *Rainfall disposition, *Cloudbursts, *Drainage e gineering, *Design storm, Storm runoff, Desig data, Design criteria, Weather patterns, Precipit tion, Central US, Illinois, Urbanization, Rai Hydrographs, Surface runoff, Storms, Rainfall-r noff relationships.
Identifiers: *Thunderstorm rainfall.

Procedures were developed that can be used better specify storm rainfall as an aid in producin better designs of urban storm drainage system Heavy storm rainfall in the Midwest occurs mo frequently from thunderstorm cells. The rain c reaching the ground has a diameter of 3 to 6 mile an area of 15 to 30 square miles, moves at velocity of 20 to 30 miles per hour, and has a dur tion of 30 to 60 minutes. Most of the rainfall occu during the first 10 minutes; it occurs in 2 to bursts, and 2 or 3 cells usually occur together. T resulting dynamic rainfall input onto an urb basin is a matrix in six dimensions of: depth, are duration, frequency, sequence, and place. In co sideration of the possible mean, inherent variabi ty, and skew of each of these six parameters t resulting matrix is almost impossible to evaluate. lustrations are given of five traditional, two-dime sional plots dealing with various pairs of these parameters or dimensions. Using point rainfall da for north-central Illinois, the Road Researc Hydrograph Method is used for an urban basin Chicago to show the effect of rainfall variability the resulting flood runoff hydrograph. For vario recurrence interval events, deviations from t mean rainfall depth of 6 to 15 percent are reflect directly in the resulting flood peaks. This exemp

ies an inherent variability which must be accom-nodated in all storm drainage design. (Poertner)

ATLANTIC HURRICANE SEASON OF 1970,
National Oceanic and Atmospheric Administra-ion, Miami, Fla. National Hurricane Center.
t. H. Simpson, and Joseph M. Pelissier.
Monthly Weather Review, Vol 99, No 4, p 269-77, Apr 1971. 9 p, 4 fig, 1 tab, 6 ref.

Descriptors: *Hurricanes, *Atlantic Ocean, *U-ited States, *Storms, Reviews, Gulf of Mexico, Winds, Wind velocity, Precipitation (Atmospher-c), Hydrologic data, Meteorological data, Tropical egions.
Identifiers: *Hurricanes (1970), *Tropical storms, torm damage.

A general overview of the 1970 hurricane season in he North Atlantic is presented together with etailed accounts of all named tropical cyclones nd certain subtropical or hybrid storms. Of the even named Atlantic storms of 1970, only three eached hurricane intensity; and only Celia brought urricane-force winds to the United States. These gures compare with a total of 180 tropical storms nd hurricanes over the past two decades for a early average of nine. Of these, an average of hree per year crossed the U.S. coastline, and three very 2 years brought hurricane winds to the main-nd. Nevertheless, 1970 will be remembered as the ear of Celia, the most destructive storm ever to each the Texas coast. (Woodard-USGS)
W71-07265

AN APPARENT RELATIONSHIP BETWEEN THE SEA-SURFACE TEMPERATURE OF THE TROPICAL ATLANTIC AND THE DEVELOP-MENT OF AFRICAN DISTURBANCES INTO TROPICAL STORMS,
National Oceanic and Atmospheric Administra-on, Miami, Fla. National Hurricane Center.
Toby N. Carlson.
Monthly Weather Review, Vol 99, No 4, p 309-10, Apr 1971. 2 p, 1 fig, 1 tab, 4 ref.

Descriptors: *Storm structure, *Water tempera-ure, *Atlantic Ocean, *Tropical regions, Weather forecasting, Storms, Regression analysis, Hydrologic data, Meteorological data, Isotherms, Hurricanes, Surface waters.
Identifiers: *African coast.

An analysis of sea-surface temperatures over the ropical Atlantic for the past 5 yr shows a correla-on between the number of tropical storms formed etween July 10 and September 20 and the ocean emperatures over a wide area centered near 10 eg N and 35 deg W. If the sea-temperature nomaly in the tropical Atlantic proves to be per-stent for periods of several months, it may ecome useful as a predictor of hurricane activity or that season. (Woodard-USGS)

SNOWFALL PREDICTION METHOD FOR HE ATLANTIC SEABOARD,
llied Research Associates, Inc., Concord, Mass.; nd Center for the Environment and Man, Inc., artford, Conn.
avid B. Spiegler, and George E. Fisher.
Monthly Weather Review, Vol 99, No 4, p 311-25, Apr 1971. 15 p, 28 fig, 2 tab, 15 ref.

Descriptors: *Snowfall, *Melt water, *Weather orecasting, *Atlantic coastal plain, Model studies, eviews, Hydrologic data, Meteorological data, limatic data, Methodology.
Identifiers: *Atlantic seaboard, *Snowfall predic-on.

Melted precipitation and snowfall data from eight inters were used to develop a snow and melted recipitation prediction model associated with 50-mb cyclones along the Atlantic Seaboard. The major potential for heavy snow exists in a band extending from 75 to 225 miles to the left and from 250 to about 1,000 miles ahead of the 850-mb cyclone in the 12-hr period beginning 6 hr after routine upper air observation time. Application of the prediction model of snow amounts to some storms from the 1968-1969 winter season indicate they provide valuable guidance to the forecaster during periods of East Coast storms. (Woodard-USGS)

ATLANTIC TROPICAL SYSTEMS OF 1970,
National Oceanic and Atmospheric Administration, Miami, Fla. National Hurricane Center.
Neil L. Frank.
Monthly Weather Review, Vol 99, No 4, p 281-285, Apr 1971. 5 p, 3 fig, 4 tab, 6 ref.

Descriptors: *Storms, *Hurricanes, *Tropical regions, *Storm structure, Reviews, Atlantic Ocean, Gulf of Mexico, United States, Meteorological data, Data collections.
Identifiers: *Tropical storms, *Storm origins, *Storms (1970).

The history of all tropical systems that formed over the Atlantic, Caribbean, and Gulf of Mexico during the 1970 hurricane season is documented. There were a total of 87 systems from which 26 depressions and seven named storms evolved. Systems that originated on the Atlantic side of Central America played a very prominent part in producing a bumper crop of east Pacific storms and hurricanes where 18 storms formed. Eleven of these were initiated by systems of African origin. Two were spawned by waves that formed over the Caribbean, and five storms emerged from the ITCZ in the Pacific. (Woodard-USGS)
W71-07268

CALCULATION OF MEAN AREAL DEPTH OF PRECIPITATION,
Tennessee Univ., Knoxville. Dept. of Engineering Mechanics.
J. E. Akin.
Journal of Hydrology, Vol 12, No 4, p 363-376, Mar 1971. 14 p, 9 fig, 2 tab, 3 ref, 2 append.

Descriptors: *Depth-area-duration analysis, *Computer programs, Runoff forecasting, Rainfall-runoff relationships, Networks, Rain gages, Precipitation (Atmospheric), Data processing.
Identifiers: *Precipitation data analysis.

A new procedure for the calculation of the mean areal depth of precipitation is presented and compared with the commonly used methods. The procedure is conceptually simple and easily programmed for computer application. This procedure assumes a linear distribution of precipitation between stations. Thus its accuracy is directly dependent on the accuracy of this assumption. There are many cases where the true distribution of precipitation is not linear. A coarse linear distribution probably would not adequately model the true distribution. In such cases, one should obtain better accuracy by using the nonlinear distribution model also presented. (Knapp-USGS)
W71-07270

STORM INTENSITIES VERSUS SEASONAL RAINFALLS,
Melbourne Univ. (Australia). Dept. of Agricultural Engineering.
A. K. Turner.
Journal of Hydrology, Vol 12, No 4, p 377-386, Mar 1971. 10 p, 3 fig, 6 tab, 11 ref.

Descriptors: *Rainfall intensity, *Rainfall disposition, *Distribution patterns, Rain gages, Networks, Meteorology, Frequency analysis, Duration curves, Probability, Storm runoff, Statistical methods.
Identifiers: *Storm intensity.

To test the hypothesis 'if the seasonal distribution of rainfall is similar at two stations, there is probably a consistent relationship between intensity and duration of rainfalls for a given average frequency', data from three separated localities were examined. The results indicate close relationships between yearly, seasonal, monthly and the longer storm events, but discrepancies occur for the shorter time intervals. It is suggested that these discrepancies are due to thunderstorms and should be considered separately from the rest of the data. (Knapp-USGS)

A BIBLIOGRAPHY OF ARCTIC WATER RESOURCES,
Alaska Univ., College. Inst. of Water Resources.
Charles W. Hartman, and Robert F. Carlson.
Available from the National Technical Information Service as PB-198 668, $3.00 in paper copy, $0.95 in microfiche. Alaska Institute of Water Resources, Report No IWR-11, Nov 1970. 552 p. OWRR Project A-031-ALAS (1).

Descriptors: *Alaska, *Arctic, *Cold regions, *Bibliographies, Polar regions, Subarctic, Permafrost, Glaciology, Snow.

This bibliography of 2978 references consists of two parts - a keywords listing and citation section. The entries were selected for inclusion on the basis of their relevance to the understanding the nature of the land-based water cycle in Alaska's Arctic and Sub-Arctic regions. All available references to Alaskan areas with the exception of the southeast region were included. With few exceptions material has been excluded which was primarily concerned with the mechanical aspects of permafrost and oceanographic data. References concerning glaciology, water supply, and waste disposal were not specifically searched, but were included when available.

MEASUREMENT OF DISCHARGE UNDER ICE COVER,
Department of Energy, Mines and Resources, Ottowa (Ontario). Inland Waters Branch.
P. W. Strilaeff, and J. H. Wedel.
Canada Dept. of Energy, Mines, and Resources, Inland Waters Branch Technical Bulletin No 29, 1970. 14 p, 13 fig, 1 tab.

Descriptors: *Discharge measurement, *Streamflow, *Ice, *Ice-water interfaces, Methodology, Stream gages, Instrumentation, Current meters, Water levels, Surface waters, Hydrologic data, Evaluation.

Identifiers: *Ice covered streams, *Northern Canada.

Many difficulties are encountered in the measurement of discharge under ice cover, particularly in the operation of hydrologic data-gathering networks located in Arctic and Sub-Arctic regions. Difficulties result from extreme ice thicknesses, double thicknesses of ice, large depths of slush ice, coincidence of spring flows with ice breakup, freeze-up of gaging equipment in sub-zero temperatures, etc. Some of these difficulties are discussed, and procedures used in the operation of networks in northern areas of Canada are outlined. A possible technique for the estimation of river discharge using a single velocity in a cross-section is briefly described, and a comparison of accuracy between discharges derived using this technique and measured discharges using standard methods is demonstrated. (Woodard-USGS)

PREDICTING THE DATE OF LAKE ICE BREAKUP,
National Research Council of Canada, Ottawa (Ontario). Div. of Building Research.
G. P. Williams.
Water Resources Research, Vol 7, No 2, p 323-333, Apr 1971. 11 p, 5 fig, 6 tab, 13 ref.

Descriptors: *Ice breakup, *Iced lakes, Melting, Lakes, Lake ice, Forecasting, Heat budget, Energy budget, Statistical methods, Wisconsin, Data collections.
Identifiers: *Canada, *Lake ice breakup.

Standard deviations for lake breakup dates were calculated for all lakes in Canada with reasonably long breakup records and for five lakes in Wisconsin with long-term records. Standard deviations were about 13 days for coastal lakes and 7-11 days for continental lakes. The accuracy of the melting degree day method of predicting breakup dates were investigated for 12 of these lakes; standard deviations ranged from 3.3-8.0 days. Regression equations for predicting breakup dates were developed from past breakup and air temperature records for the 12 lakes; standard errors ranged from 1.6-4.3 days. General forecast guidelines were developed for application to lakes with limited breakup records. The equations and forecast guidelines are suitable only for continental lakes where wind and river inflow effects are not dominant. (Knapp-USGS)

2D. Evaporation and Transpiration

THE PRODUCTIVITY OF ZONAL TERRESTRIAL PLANT COMMUNITIES AND THE MOISTURE AND HEAT PARAMETERS OF AN AREA,
Akademiya Nauk SSSR, Moscow. Institut Geografii.
A. V. Drozdov.
Soviet Geography: Review and Translation, Vol 12, No 1, p 54-60, Jan 1971. 3 fig, 1 tab, 13 ref.

Descriptors: *Solar radiation, *Productivity, *Climatic zones, *Heat, *Evapotranspiration, Environmental effects, Plant growth, Moisture availability, Seasonal, Latitudinal studies, Biological communities.
Identifiers: *Dryness index.

Previous studies by Budyko and Grigor'yev indicate that the zonal distribution of plant production is related to the radiation index of dryness, radiation (R)/the amount of heat needed to evaporate the annual precipitation (Lr). They then suggested that: (1) Plant community productivities are maximal when R/Lr is at some optimal valve close to 1.0, and fall off on both sides of the optimal valve at constant R (2) For an optimal R/Lr valve, productivities will increase with increases of absolute valve of the components of the ratio. Unfortunately, their phytomass data did not include below ground portions of the plants and their precipitation figures were low. Using corrected data for 27 communities or zonal landscapes, the author demonstrates relationships between total annual growth of zonal plant communities in various thermal belts and dryness indices, total annual growth at different dryness indices and R, and R vs. R/Lr at different annual growths. Annual growth decreased steadily with increasing R/Lr and increased steadily with R. Increases of growth with R/Lr down to 0.5 (when R is greater than 40 kcal./sq.cm./yr.) indicates that a dryness index close to unity need not necessarily be optimal in all thermal belts. (Casey-Arizona)

EFFECT OF ENVIRONMENTAL FACTORS ON CUTICULAR TRANSPIRATION RESISTANCE,
National and Univ. Inst. of Agriculture, Rehovoth (Israel). Volcani Inst. of Agricultural Research.
S. Moreshet.
Supported in part by PL480 Grant A10-SWC-29 from the US Department of Agriculture. Plant Physiology, Vol 46, No 6, p 815-818, Dec 1970. 3 fig, 2 tab, 19 ref.

Descriptors: *Cuticle, *Transpiration, *Resistance, *Humidity, *Environmental effects, Mode of action, Laboratory tests, Stomata, Soil moisture, Theoretical analysis, Wettability, Drought resistance.
Identifiers: *Water potential, *Relative humidity.

Plant transpirational water flux takes place via stomatal apertures and through the cuticle. The influences of environmental conditions on cuticular transpiration are not well understood partly because cuticular resistance measurements have usually been made in the dark, assuming stomata were closed. Sunflower (Helianthus annus) plants, with all but the youngest leaf removed, were grown under 3 levels each of soil water potential, light intensity and relative humidity to which the leaves were exposed, allowing 27 different combinations, values of total leaf resistance (calculated from transpiration flux and water concentration gradient measurements) were measured, as well as values of upper and lower transpiration resistance and the sum of stomatal resistances on both sides of the leaf. The only factor affecting citicular transpiration was relative humidity, which was inversely proportional to cuticular resistance to water loss. This response may be explained by drought-caused cuticular shrinkage, alterations in the air-water interface or changes in the wettability of the cuticle. This phenomenon would be a useful adaptation to arid conditions, reducing water loss during drought, but allowing direct absorption of atmospheric moisture or dew during moist periods. (Casey-Arizona)

SERIAL CORRELATION IN ANNUAL STREAM RUNOFF,
Washington State Univ., Pullman. Dept. of Civil Engineering.
Kenneth W. Martig, Jr., and Thomas H. Campbell.
University of Washington, Charles W. Harris Hydraulics Laboratory, Technical Report No 24, June 1968. 43 p, 12 fig, 15 ref, 3 append. OWRR Project A-020-WASH (1).

Descriptors: *Mathematical models, *Streamflow, *Correlation analysis, *Simulation analysis, Hydrology, Forecasting, Planning, Gaging stations, Computer models, Sampling, Data collections, Markov processes, Model studies, Hydrologic data, Runoff.
Identifiers: *Thomas-Fiering algorhythm, *Historic flow records, *Serial correlation.

Using 31 streams of long historic annual stream flow record, the Thomas-Fiering algorhythm was found to be the best mathematical representative of sequential values of annual streamflow. This linear simulation was more accurate than these non-linear methods tested: the Sinh function method, the Three-Degree Polynomial method, the Natural Log of Flow vs. Natural Log Function method, and the One-Degree Markov chain. However, on 25 streams, multiple Markov chains produced the greatest reduction of unexplained error. Markov chains of 6 degrees or multiples of 6 were the most successful. The length of historic streamflow data was found insufficient for residual-number skewness of Kurtosis trends to be treated as anything but random variables, though skewness might appear if longer historic records were available. AN APPROACH TO THE SELECTION OF A STREAMFLOW BASE PERIOD,
Wyoming Univ., Laramie. Water Resources Research Inst.
William N. Embree.
Wyoming Water Planning Report No 6, Water Resources Series No 20, July 1970. 112 p, 13 tab, 26 fig, 24 ref. OWRR Project A-001-WYO (33).

Descriptors: *Streamflow, *Synthetic hydrology, *Correlation analysis, *Mass curves, *Statistical methods, Sampling, Wyoming, Gaging stations, Correlation analysis, Water Resources Research Act.
Identifiers: *Base period, Mean, Standard deviation, Variation coefficient.

The 20-year period from 1948 to 1968 provides sufficient information on base period for Wyoming streamflow for 23 representative gaging stations. A base period is defined as a shorter period of record which has the same statistical properties as the longer record, and can be used in simplifying the study of water resources. The mean, standard deviation, and variation coefficient of the base period and long-term record should be similar. There was a 10% or less difference for most streams between 1948 to 1968 and longer records. The 20-year mean is within 6% of the longer mean with 95% confidence, and within 2% of the longer mean with 50% confidence for the Madison River

Related research, methods of analysis, and detailed results are discussed. There are 13 tables of sample size, errors and station descriptions, 26 figures, and 24 references. (Popkin-Arizona)

WATER RESOURCES OF THE BELMONT-MARTHAVILLE-ROBELINE AREA, LOUISIANA,
Geological Survey, Baton Rouge, La.
A. J. Calandro, W. L. Broussard, and R. L. Hosman.
Louisiana Geological Survey and Department of Public Works Water Resources Pamphlet No 25, Nov 1970. 21 p, 1 fig, 5 tab, 10 ref.

Descriptors: *Water resources development, *Surface waters, *Groundwater, *Louisiana, *Water supply, Aquifers, Water quality, Reservoirs, Water yield, Water storage, Hydrologic data, Water utilization, Hydrology.
Identifiers: Bayou Dupont (La).

The water-supply sources available for public supplies for Belmont, Marthaville and Robeline, in west-central Louisiana, are appraised. Bayou Dupont and its tributaries cannot provide a dependable water supply for the area without use of storage facilities. At Robeline the stream flows 0.1 cubic foot per second or more 80 percent of the time, and 0.5 cubic feet per second or more can be expected 90 percent of the time. A reservoir on Bayou Dupont at Robeline with 790 acre-feet of storage could sustain a draft rate of 1 million gallons per day. Sediment concentrations during storm periods range from 1,000 to 3,800 milligrams per liter. The average sediment concentrations during other periods are about 300 mg/liter. Fresh groundwater is available from sands of the Wilcox Group. The water is generally soft but locally may be highly colored. The iron content varies and can be high enough to require treatment for removal to be suitable for public supplies. (Woodard-USGS)

ANNUAL WATER-RESOURCES REVIEW, WHITE SANDS MISSILE RANGE, 1970,
Geological Survey, Albuquerque, N. Mex.
A. Basler.
Geological Survey Basic-Data Report (Open file), Mar 1971. 33 p, 8 fig, 4 tab.

Descriptors: *Water resources development, *Surface waters, *Hydrologic data, *Groundwater, New Mexico, Water quality, Water wells, Pumping, Water yield, Water level fluctuations, Streamflow, Runoff, Flow measurement, Precipitation (Atmospheric), Chemical analysis, Data collections, Evaluation.
Identifiers: *White Sands Missile Range (N Mex).

Information on the water resources of the White Sands Missile Range in New Mexico that was collected during the period January 1970 to January 1971 by personnel of the U.S. Geological Survey, Water Resources Division is presented. Data on groundwater pumpage and resulting water-level fluctuation, chemical quality, precipitation, and surface-water runoff are summarized. Total groundwater pumpage at White Sands Missile Range in 1970 was 923,059,000 gallons. Declines of water level occurred in all wells located within a radius of about 1 mile of the middle of the Post Headquarters well field. The chemical quality of water samples collected during 1970 was similar to that of samples collected from the same sources during 1969. The specific conductance of samples collected in December 1969 and 1970 ranged from 242 to 2,580 micromhos in 1969 and from 262 to 2,780 in 1970. Surface-water runoff amounts of 14 acre-feet, and 61 acre-feet were recorded in 1970 at the gage 1 mile north of the Main Gate, and 1.5 miles south of the Main Gate, respectively. During 1969 the runoff at the north gage totalled 132 acre-feet; 96 acre-feet were recorded at the south gage. (Woodard-USGS)

PROBABILITIES FOR SIMULTANEOUS OCCURRENCE OF FLOODS IN THE DANUBE AND INN RIVERS BEFORE AND AFTER COMPLETION OF STRUCTURES IN THE DANUBE RIVER,
Gert A. Schultz.
Wasserwirtschaft, Vol 9, p 293-296, 1970. 9 fig, 1 tab, 6 ref.

Descriptors: *Floods, *Flooding forecasting, Synthetic hydrology, Hydraulic structures.
Identifiers: *Danube River, *Inn River.

The flood statistics for the city of Passau reveal that whenever one of these two rivers carried a flood wave the other produces a flood several days after. The Danube peak usually follows the Inn peak. Based on 67 independent flood events between 1926 and 1967, the probability for the 'critical case' (the simultaneous occurence of flood peaks of the Danube and Inn Rivers' confluence) has been investigated and reported herein. An attempt has been made to estimate the influence of hydraulic structures in the Danube river upstream of the confluence on the 'critical case' probability. If this influence can be determined then it is possible to investigate the future tendency of a synthetic flood frequency analysis for the Danube river downstream of the confluence.
W71-07513

EVALUATION OF THE QUANTITY AND QUALITY OF THE WATER RESOURCES OF VOLUSIA COUNTY, FLORIDA,
Geological Survey, Tallahassee, Fla.
Darwin D. Knochenmus, and Michael E. Beard.
Florida Bureau of Geology Report of Investigations No 57, 1971. 59 p, 22 fig, 8 tab, 15 ref, append.

Descriptors: *Water resources development, *Florida, *Aquifers, *Streamflow, Artesian wells, Recharge, Natural recharge, Water yield, Water quality, Water balance, Groundwater movement, Groundwater, Surface waters.
Identifiers: *Volusia County (Fla).

Velousia County includes about 1,200 square miles along the central east coast of Florida. Water use in 1967 averaged about 25.9 mgd, of which the major use (15.8 mgd) was for public supply. In the 20-year interval, 1950 to 1970, the amount of water used for public supply, all of which is groundwater, more than doubled. On the average, it is estimated that 300 mgd is available for man's use. Ninety-five percent of the water used in Volusia County comes from the Floridan aquifer. Recharge to the Floridan aquifer occurs throughout the county wherever the water table in the surface aquifer is higher than the piezometric surface in the Floridan aquifer. In the central part of the county the clastic aquifer is full and rejecting recharge through runoff and evapotranspiration. If the piezometric surface were lowered in this area by withdrawing water from the Floridan aquifer for use, this rejected recharge would be decreased by the capture of water. This would increase the amount of water available for use. The average streamflow is many times larger than the water use for the entire county supply. (Knapp-USGS)

OPERATIONAL HYDROLOGY FOR UNGAGED STREAMS BY THE GRID SQUARE TECHNIQUE,
Department of Energy, Mines, and Resources, Ottawa (Ontario).
R. L. Pentland, and D. R. Cuthbert.
Water Resources Research, Vol 7, No 2, p 283-291, Apr 1971. 9 p, 4 fig, 3 tab, 6 ref.

Descriptors: *Synthetic hydrology, *Simulation analysis, *Streamflow forecasting, Stream gages, Data collections, Planning, Gaging stations, Rainfall-runoff relationships, Mathematical models.
Identifiers: *Canada, *New Brunswick (Canada).

The definition of areal runoff in geographic areas with basically similar hydrologic characteristics can be facilitated by the grid square technique. This technique entails dividing the study area into a uniform grid. Such a procedure provides a means of storing and retrieving information regarding the grid square areas. The grid square technique is used extensively in Canada for assessing water resource potential as well as for planning hydrometric networks. The method can conveniently be extended to generate synthetic streamflow traces on ungaged streams. The grid square technique and its extension to operational hydrology are discussed, along with an example from the New Brunswick region of Canada. (Knapp-USGS)
W71-07622

DERIVATION OF BASE FLOW RECESSION CURVES AND PARAMETERS,
Illinois State Water Survey, Urbana.
Krishan P. Singh, and John B. Stall.
Water Resources Research, Vol 7, No 2, p 292-303, Apr 1971. 12 p, 6 fig, 3 tab, 17 ref.

Descriptors: *Base flow, *Recession curves, *Surface-groundwater relationships, *Water storage, Hydrographs, Hydrograph analysis, Discharge (Water), Streamflow, Streamflow forecasting, Runoff forecasting, Storage coefficient.
Identifiers: *Boussinesq equation.

The Boussinesq equation is used to show that base flow recession is an exponential decay function. For a single peaked hydrograph, the storage delay factor Kb, which is the time for base flow to decrease by a factor of 10, is estimated. The parameter Kb is adjusted by trial so that surface flow, or the observed total flow minus base flow, is also an exponential decay function after the point of inflection on the hydrograph recession. The same parameter for surface flow, Ks, is so determined. For 22 basins in Illinois, the dormant season Kb ranges from 15-100 days and is associated with physiography. Ks varies from 1.8-6.0 days. (Knapp-USGS)
W71-07623

STREAM CHANNELS AND FLOW RELATIONS,
Minnesota Univ., Minneapolis. Dept. of Geography.
Dwight A. Brown.
Water Resources Research, Vol 7, No 2, p 304-310, Apr 1971. 7 p, 2 fig, 3 tab, 4 ref.

Descriptors: *Stage-discharge relations, *Streamflow forecasting, *Flood forecasting, *Channel morphology, Frequency analysis, Open channel flow, Rainfall-runoff relationships, Discharge coefficients, Water levels.
Identifiers: *Channel capacity.

Channel capacity is considered as a reconnaissance technique for estimating mean flow and the magnitude of floods at various expected frequencies. Low flows have diminishing relationships to channel capacity with increasing severity of low flow. Equations were derived to estimate flood magnitudes and provided good results when tested within the same environment. The coefficients of the derived equations lack transferability to different physical environments. (Knapp-USGS)

A STUDY OF THE BASE FLOW CHARACTERISTICS OF THE CHAO PHRAYA RIVER,
Asian Inst. of Tech., Bangkok (Thailand). Dept. of Engineering.
Vatana Meevasana.
M Sc Thesis, No 283, Asian Institute of Technology, Bangkok, 1969. 94 p, 19 fig, 19 tab, 28 ref, 3 append.

Descriptors: *Base flow, *Streamflow, *Rainfall-runoff relationships, *Surface-groundwater relationships, Statistical methods, Regression analysis, Mathematical studies, Flow characteristics, Data collections, Hydrologic data, Irrigation, Evaporation.
Identifiers: *Chao Phraya River (Thailand).

Variations of base flow in the Chao Phraya River at Nakhon Sawan, Thailand, are predicted. A statistical method is used to correlate the base flow characteristics with the change in hydrologic and physiographic factors over the drainage basin. Flood season runoff volume, flood peak discharge, and current year rainfall are the indicators of groundwater recharge, but they depend on each other. Since these variables are not independent of each other they are not selected at the same time in a multiple regression equation. Only the most suitable one is selected. Among the various measures describing the carry over storage, the dry season base flow volume of the preceding year gives the most significant correlation to the volume of current year base flow. The water used in irrigation is mainly diverted from the base flow since no large storage dams had been built prior to 1962. The dry season rainfall is less than the accumulated draft on soil moisture due to evapotranspiration. So it creates neither direct runoff nor groundwater recharge to affect the base flow. FLOOD HYDROGRAPHS FROM SMALL WATERSHEDS,
Asian Inst. of Tech., Bangkok (Thailand). Dept. of Engineering.
Chumporn Komsartra.
M Sc Thesis, No 278, Asian Institute of Technology, 1969. 73 p, 29 fig, 6 tab, 19 ref, 6 append.

Descriptors: *Rainfall-runoff relationships, *Small watersheds, *Hydrographs, *Model studies, *Streamflow, Flow characteristics, Peak discharge, Mathematical model, Equations, Regression analysis, Methodology, Design flood.

A method for the determination of the peak rate of runoff and the design hydrograph from small ungaged watersheds of drainage area up to 1000 square kilometers is presented. Flood hydrographs from 5 small watersheds were analyzed. The mathematical model, a two parameter gamma distribution, was fitted to the observed hydrograph. The average dimensionless unit hydrograph is recommended for determination of design hydrographs for a tropical regions such as Thailand. The hydrograph parameters are correlated to 4 measurable watershed characteristics including watershed area, length of main stream, length of the stream to the center of the watershed, and slope of the longest watercourse. Two simple empirical equations from regression analysis are presented for determination of hydrograph parameters, peak discharge, and time to peak, which can be used to derive the complete hydrograph. The method is suitable for use in the design of small hydraulic structures such as culverts and highway drainage which usually are constructed on an ungaged watershed. (Woodard-USGS)

EVALUATION OF THE STREAMFLOW DATA PROGRAM IN COLORADO,
Geological Survey, Denver, Colo.
Russell K. Livingston.
Geological Survey Open-file Report, Dec 1970. 72 p, 3 fig, 4 tab, 24 ref, 3 append.

Descriptors: *Streamflow, *Data collections, *Network design, *Colorado, Reviews, Evaluation, Project planning, Project purposes, Stream gages, Hydrologic data, Natural flow, Regulated flow, Regression analysis.
Identifiers: *Streamflow characteristics.

Colorado streamflow information was evaluated to assess the adequacy of the present program and to suggest modifications to improve the program. The ultimate objective is to provide adequate streamflow information at any point on any stream in Colorado. The basic steps in the evaluation were (1) classify streamflow information into four types of data -- current use, planning, and design, long-term trends, and stream environment, (2) define adequacy goals for each type of information, and (3) evaluate the program according to these goals. The results of the evaluation are as follows: (1) Goals for current use are being met. Ten gaging stations no longer needed are being discontinued. (2) Goals for planning and design are not being met. Eighteen additional gaging stations should be installed to provide better areal coverage of principal streams. (3) Goals to define long-term trends can be met by perpetual operation of 15 current gaging stations. (4) Goals on stream environment are not being met. These data are becoming increasingly important and warrant greater effort in the future. (Woodard-USGS)

This issue of the serial publication contains 14 arti cles, a number of which deal with methods used t compute maximum discharges from melt and rai waters. In several of the articles the 'Promin' com puter is mentioned as a possible means of perform ing computations. A method for forecasting sprin runoff from rivers of the Dniester Basin is advance along with a method for studying asynchronou fluctuations in hydrometeorological phenomena b means of stochastic matrices. Considerable atter tion is paid to the formation conditions of dry weather flow and the ice-heat regime, classificatio of torrential mudflows, and to the perfecting of a electrolytic method for measuring wate discharges. Descriptors: *Discharge (Water), *Reservoir *Hydrographs, *Hydrograph analysis, Time la River basins, Computers.
Identifiers: *Ukraine, Dnieper River, Travel time.

A method for computing high water discharges b taking into account the regulating effect of a rese voir is described. Over 50 rivers in the Dniep Basin are examined for studying patterns in the i crease of water basin areas according to riv length and for analyzing the distribution of wat basin areas based on this length. Discharges from basin separated by a reservoir are represented the sum of transformed discharges from an upp partial water basin, enclosed between the outl and discharge site of a reservoir dam, a discharges from a lower partial water bas removed from the dam to the outlet. Discharg from partial reservoirs are derived from a genet runoff formula corrected by lag coefficients, whi take into account the degree of transformation discharge from sections between isochrones. 'Promin' computer has been used to eliminate t drudgery of computations associated with compu ing hydrograph discharges. Nomograms have be prepared showing coefficients of decrease in ma imum discharges from the basin as a whole a from the upper partial water basin as a function time lag. CALCULATIONS OF HIGH WATE DISCHARGES ON THE 'PROMIN' COMPUTE (RASCHETY RASHHODOV POLOVOD'YA N EVM 'PROMIN'),
V. I. Moklyak, and N. S. Snesareva.
In: Gidrologicheskiye issledovaniya i raschet Ukrainskiy Nauchno-Issledovatel'sk Gidrometeorologicheskiy Institut Trudy, No 8 Gidrometeoizdat, Moscow, p 27-29, 1969. 3 p, tab, 1 ref.

Descriptors: *Discharge (Water), *Hydrographs, *Computers, *Hydrograph analysis, Time lag, Model studies, Reservoirs, Inflow, Regulated flow, Channel flow.
Identifiers: *Ukraine.

Hydrograph discharges were calculated on a computer by successive remultiplication of the ordinates of a unit hydrograph by the volume of inflow from an entire basin, by summing up partial discharges on the basis of their simultaneous lag. Discharges were calculated on the 'Promin' computer in two programs: 'Vesna-I' on six punch cards for determining the ordinates of the unit hydrograph and 'Vesna-II' on ten punch cards for determining discharges of the hydrograph. About 100 unit hydrographs, which took into account the varied duration of time lag and typical charts of basin width, were calculated on the 'Promin' computer. Charts of inflow were expressed by four models. About 400 hydrographs were prepared for determining the effect of hydrographic, meteorological, hydraulic, biological and other factors on high water discharge. (Josefson-USGS)

Descriptors: *River basins, *Melt water, *Inflow, *Hydrologic data, *Discharge (Water), Gaging stations, Hydrographs, Runoff, Runoff coefficient, Meteorology, Peak discharge.
Identifiers: *Ukraine, Dnieper River, Southern Bug River, Severskiy Donets River, Azov Sea, Balance method, Peak flow.

The unit inflow of melt waters from a basin into a channel system during high water periods is examined. The daily rate of unit inflow from small and average-size water basins is derived by the balance method by means of retransformation of recorded high water discharges. Data on daily inflow rate, its maximum and total value, duration of unit inflow and the ratio of peak to basin yield during high waters were determined from 244 gaging stations on lowland rivers of the Dnieper, Southern Bug, Severskiy Donets and Azov Sea Basins. Unit inflow charts expressed in percent may be used in hydrologic computations for constructing hydrographs of infrequently recurring spring high waters on the basis of a total runoff layer of given probability. A small daily difference in layers may be due simply to local characteristics of runoff formation, distribution of snow storage on the water basin or inaccurate measurement of high water runoff. A METHOD FOR FORECASTING SPRING RUNOFF FROM RIVERS IN THE DNIESTER BASIN (METODIKA PROGNOZA VESENNEGO STOKA REK BASSEYNA DNESTRA),
V. V. Shcherbak.
In: Gidrologicheskiye issledovaniya i raschety, Ukrainskiy Nauchno-Issledovatel'skiy Gidrometeorologicheskiy Institut Trudy, No 85; Gidrometeoizdat, Moscow, p 80-84, 1969. 5 p, 4 fig, 1 tab, 6 ref.

Descriptors: *Runoff, *Rainfall-runoff relationships, *Runoff forecasting, *Rivers, Snowmelt, Seasonal, Precipitation (Atmospheric), Statistical methods, Thawing, Water balance, Discharge (Water).
Identifiers: *Ukraine, Dniester Basin.

A study of spring runoff conditions for the Dniester River and several of its tributaries has revealed that there is a relationship between spring runoff and snow storage at the start of thaw and the amount of precipitation during a high water period. Despite a high correlation coefficient between snow storage at start of thaw and spring runoff (0.74), the amount of precipitation during the high water period is a major factor in the formation of runoff. In rivers of the mountain part of the basin, where the major share of Dniester spring runoff is formed, the rain component in high water runoff is 40-50%, increasing during individual years to 60-70%. The amount of snow storage and precipitation for partial water basins is determined by averaging the readings of stations located at these water basins or nearby. An index of average snow storage in the Dniester Basin to Mogilev-Podol'skiy and of precipitation during the high water period is determined as the weighted mean of these amounts, based on their participation in runoff, for the right and left banks of the basin. The closeness of the relationships obtained is quite sufficient for use in calculating and forecasting magnitude of spring runoff. (See also W71-07647) (Josefson-USGS)

In: Gidrologicheskiye issledovaniya i raschety, Ukrainskiy Nauchno-Issledovatel'skiy Gidrometeorologicheskiy Institut Trudy, No 85; Gidrometeoizdat, Moscow, p 92-98, 1969. 7 p, 2 fig, 7 ref.

Descriptors: *Stochastic processes, *Probability, *Fluctuation, *Meteorology, Computers, Runoff, Precipitation (Atmospheric).
Identifiers: *Ukraine, Danube River, Dnieper River.

A method is proposed for studying asynchronous fluctuations in hydrometeorological phenomena. It is based on comparing a matrix of the distribution of empirical probabilities of simultaneous appearance of specific values for two random variables and a matrix of the theoretical probabilities of a simultaneous appearance of the same values for these variables calculated from the assumption that the values under consideration vary independently of one another. Comparison and analysis of these matrices make it possible to determine the probabilities of a simultaneous appearance of any recorded values for these variables and to introduce a probability measure of the relationship of various values to these variables. The merit of this method lies in the possibility of studying simultaneous change in both homogeneous and heterogeneous variables as well as in the possibility of estimating the degree of their interrelationship. Because of the difficulty of computing elements of stochastic matrices, all calculations were performed on the 'Ural-4' computer, with the time required to compute one total probability of a matrix not exceeding 20-25 minutes. The example used for study was the asynchronous runoff from the Danube and Dnieper Rivers and the asynchronous runoff from the Dnieper together with precipitation in the irrigation zone. DRY-WEATHER FLOW OF TRANSCARPATHIAN MOUNTAIN RIVERS (RUSSIAN: MEZHENNY STOK GORNYKH REK ZAKARPAT'YA),
K. A. Lysenko, and L. K. Sinitskaya.
In: Gidrologicheskiye issledovaniya i raschety, Ukrainskiy Nauchno-Issledovatel'skiy Gidrometeorologicheskiy Institut Trudy, No 85; Gidrometeoizdat, Moscow, p 99-103, 1969. 7 p, 2 fig, 1 tab, 2 ref.

Descriptors: *Runoff, *Low flow, *River flow, Rivers, Steady flow, Seasonal, Hydrogeology, Precipitation (Atmospheric), Meteorological data, Groundwater movement.
Identifiers: *Ukraine, Carpathian Mountains, Dry-weather flow, Regionalization.

An analysis of data for the low water period of Transcarpathian mountain rivers has revealed that there is a direct relationship between precipitation and runoff during a summer low water period. Maximum runoff values for a summer low water period (200-329 mm), lasting 100-140 days, were observed at the upper reaches of the Teresva and Tereblya Rivers and on the Belaya Tissa and Shopurka Rivers. For the other mountain rivers of Transcarpathia runoff values decreased in a west to southwest direction from 80-170 to 50-80 mm. Maximum runoff values for a winter low water period (60-129 mm), lasting 80-100 days, were typical of the mountain area, with runoff values decreasing gradually to 40-60 mm toward the foothills. Based on an established relationship between dry-weather flow and hydrogeological conditions, an attempt was made to determine the volume of runoff of a summer and winter low water period for rivers for which there were no runoff data. Two hydrogeological regions were distinguished within which the character of dry weather flow was identical to that of rivers for which there were hydrometric observation data. An analysis of runoff during low water periods revealed that there was considerable fluctuation in runoff owing to the varied extent to which the river valley incised underlying rock materials, draining of groundwater horizons into the river valley and to a diversified distribution of precipitation. HEAT REGIME CHARACTERISTICS OF RIVERS IN THE DANUBE AND DNIESTER BASINS (NEKOTORYYE OSOBENNOSTI TERMICHESKOGO REZHIM REK V BASSEYNAKH DUNAYA I DNESTRA),
N. G. Dyukel'.
In: Gidrologicheskiye issledovaniya i raschety, Ukrainskiy Nauchno-Issledovatel'skiy Gidrometeorologicheskiy Insitutu Trudy, No 85; Gidrometeoizdat, Moscow, p 104-111, 1969. 8 p, 4 fig, 4 tab, 5 ref.

Descriptors: *Heat balance, *Water temperature, *Base flow, *Groundwater recharge, Climatic data, Groundwater basins, River basins, Rivers.
Identifiers: *Ukraine, Danube River basin, Dniester River basin, Heat regime.

An analysis of the heat regime of rivers in the Danube and Dniester basins has established that heat regime characteristics differ for river reaches which have a moderate and high groundwater recharge. The heat regime for river reaches with an abundant groundwater outflow is determined more by the extent to which groundwaters participate in total runoff and by groundwater temperature than by climatic factors. The heat regime for river reaches with moderate groundwater recharge is determined by climatic characteristics, primarily air temperature. Since vertical zonality in distribution of air temperature is noted for Danube and Dniester basins, this zonality must be considered in the heat regime characteristics for river reaches with a moderate groundwater recharge. Vertical zonality in the distribution of the water temperature' of rivers in these basins makes it possible to establish relationships between heat regime characteristics (average long-term monthly water temperature values, dates of steady change in 0.2 deg increments in spring, and average rate of increase and decrease in water temperature values from month to month) and height of terrain. The relationship T—f (H) can be used to determine long-term average monthly water temperature values for rivers still unstudied. (See also W71-07647) (Josefson-USGS)

ESTIMATING THE EXTENT OF RIVER SLUSH ICE (K VOPROSU OB OTSENKE STEPENI SHUGONOSNOSTI REK),
N. G. Dyukel'.
In: Gidrologicheskiye issledovaniya i raschety, Ukrainskiy Nauchno-Issledovatel'skiy Gidrometeorologicheskiy Institut Trudy, No 85; Gidrometeoizdat, Moscow, p 112-117, 1969. 6 p, 1 fig, 2 tab, 4 ref.

Descriptors: *Ice, *Ice jams, *Melting, *Thawing, *Seasonal, Rivers, River basins, Geomorphology, Hydrologic data.
Identifiers: *Slush ice, *Ukraine, Danube River, Dniester River, Southern Bug River, Carpathian Mountains.

The absence of quantitative descriptions of river slush ice necessitates finding indirect means of estimating slush ice formation because of its significant effect on normal operation of hydraulic structures. A very convenient index for estimating river slush ice is the number of ice jams recorded over the course of a winter on a certain reach of the river. In the mountain regions (Tissa and Prut River basins) conditions most favorable for intensive slush ice formation occur during very cold winters when the number of days with thaw periods is 50-60% of the norm. On rivers of the Dniester basin (a large part of which is in the Carpathian foothills) slush ice formation is most vigorous during near-normal winters when the number of days with thaw periods is 80-100% of the norm. On the lowland rivers of the Southern Bug basin Optimal conditions for formation of slush ice are created during normal winters when the number of days with thaws is 100-120% of the norm. The extent of slush ice formation and optimal conditions for its formation on rivers in the area examined can be determined from graphs showing the relationship between the number of ice jams per winter and the severity of the season. CLASSIFICATION AND REGIONALIZATION OF TORRENTIAL MUDFLOWS IN THE UKRAINIAN CARPATHIANS (KLASSIFIKATSIYA SELEY I RAYONIROVANIYE BASSEYNOV SELEOPASNYKH REK UKRAINSKIKH KARPAT),
M. M. Ayzenberg, M. L. Vol'ftsun, and Ye. V. Khloyeva.
In: Gidrologicheskiye issledovaniya i raschety, Ukrainskiy Nauchno-Issledovatel'skiy Gidrometeorologicheskiy Institut Trudy, No 85; Gidrometeoizdat, Moscow, p 118-124, 1969. 7 p, 1 fig, 1 tab, 23 ref.

Descriptors: *Mudflows, *Sediments, *Erosion, *Regional analysis, *Sediment-water interfaces, Flooding, Flash floods, Orography, Alluvium, Petrography, Rocks, Particle size, Runoff, Vegetation.
Identifiers: *Ukraine, *Torrents, *Torrential flow, Carpathian Mountains.

Studies made in 1965-1967 of Carpathian Mountain river mud basins and torrential mudflows have suggested a new classification scheme for these mud basins. The new scheme takes into account the physico-geographic characteristics of the basins (altitude, plant cover, rocks, mud-fraction composition), maximum surface runoff, mudflow density and maximum amount of alluvium (considering the entire and denuded area of water basin), loss of alluvium by mudflow and the most probable type of torrential mudflow. Three categories of mudflow are differentiated for these basins: heavy, medium and light. Based on physico-geographic characteristics the Ukrainian Carpathians are divided into 3 mudflow areas--the northwestern, southwestern and southeastern--with a further division into subareas. A list of principal mud-laden rivers for each subarea is indicated along with the years in which mudflows were most frequently observed. (See also W71-07647) (Josefson-USGS)

DETERMINING WATER DISCHARGE BY ELECTROLYSIS WITHOUT FIELD CALIBRATION OF ELECTRODES (OPREDELENIYE RASKHODOV VODY ELEKTROLITICHESKIM SPOSOBOM BEZ POLEVOY TARIROVKI ELEKTRODOV),
N. V. Pikush.
In: Gidrologicheskiye issledovaniya i raschety, Ukrainskiy Nauchno-Issledovatel'skiy Gidrometeorologicheskiy Institut Trudy, No 85; Gidrometeoizdat, Moscow, p 130-134, 1969. 5 p, 3 fig, 1 tab, 3 ref.

Descriptors: *Electrolysis, *Discharge measurement, *Discharge (Water), Electrodes, Calibrations, Mathematical studies.
Identifiers: *Ukraine, Water electroconductivity.

Further study was made of the technical characteristics of an electrolyte water discharge gage and of the properties of a saturated water solution of common table salt. To determine water discharge by the electrolytic method without recourse to field calibration of electrodes, the following method was used. A saturated water solution of common table salt was prepared by pouring any grade of salt into a vessel and adding 1 liter of water for every 400 g of salt. After repeated mixing the solution was left to stand for at least 20 minutes until completely clear. During this time electrodes were properly secured, the instrument adjusted and water temperature and water level measured. Then, following usual procedures, the volume of solution introduced to the current was precisely measured and observations made during the entire period of passage of the ion cloud across the electrode alignment for electrolytic measurement of water discharge. By using this method, water discharges by electrolytic means were determined more rapidly and with greater accuracy. (See also W71-07647) (Josefson-USGS)

DETERMINATION OF IN SITU HYDRAULIC PARAMETERS IN JOINTED ROCK,
Imperial Coll. of Science and Technology, London (England).
C. Louis, and Y. N. Maini.
Proceedings 2nd Congress International Society of Rock Mechanics, Theme 1, No 32, Belgrade, Yugoslavia, Sept 1970. 11 p, 9 fig, 16 ref.

Descriptors: *Rocks, *Joints (Geology), Fissures, *Permeability, Pumping tests (Wells), Field tests, Test procedures, Bibliographies, *Hydraulic conductivity, *Groundwater flow, Groundwater movement, Groundwater geology, Geology.

The theory of waterflow through jointed rock has undergone rapid advancement in recent years. Digital and analog computers can now be applied to very large 2- and 3-dimensional problems, but the application of these methods is completely inadequate if no in situ hydraulic parameters are available. Most field test interpretation is based on the classical soil mechanics theory of flow through a continuum, and consequently leads to incorrect results in jointed rock. The rock is assumed to be divided by several sets of parallel joints. The problem of determining the rock mass hydraulic parameters is dealt with theoretically. Field testing requirements include either a pumping test (pumping into or out of a borehole or gallery) or a dilution test. Practical suggestions regarding the performance of these tests in the field are given. H

This is a guidebook for analyzing and evaluati pumping test data. Pumping tests help assess t groundwater resource, the major water source arid and semi-arid lands. The introduction giv definitions and discusses Darcy's law, aquifer typ hydraulic properties and types of flow equatio General set-up, performance and data analysis pumping tests are described. Chapter three giv methods of analyzing steady-state and unstead state flow in confined, semi-confined and unco fined aquifers, and unsteady-state flow in unco fined aquifers with delayed yield and in semi-u confined aquifers (Boulton's method). Chap four presents methods of analyzing the spec cases of aquifers limited by one or more bound ries, anisotropic aquifers, wedge-shaped aquife sloping aquifers, aquifers pumped at a varia discharge rate, partially penetrated aquife aquifers pumped by a large diameter well, tw layered semi-confined aquifers, approximati methods and free flowing wells. Corrections a unit conversions are discussed. Examples method application are given. There are 11 w function tables, and 18 tables of empirical, a conversion data. (Popkin-Arizona)

CHARACTERIZATION OF WATER TABLES OREGON SOILS WITH REFERENCE TO TRA FICABILITY,
Army Engineer Waterways Experiment Stati Vicksburg, Miss.
L. Boersma, and G. H. Simonson.
Sponsored by US Army Materiel Comma prepared under contract with Department of So Oregon State University, Corvallis, Oregon. Army Engineer Waterways Experiment Stati Vicksburg, Mississippi, Contract Report M-70 May 1970. 2 vols--Vol I: Data, 235 p; Vol II: Ana sis, 108 p. 1T021701A046 and 1V025001A1 Task 02.

Descriptors: *Water table, *Soil moisture, *Tr ficability, *Soil strength, *Soil tests.
Identifiers: *Oregon soils.

Three near-model test sites were established each of five soil series of the Willamette Catena western Oregon. Field and laboratory tests on s from 15 test sites were initiated in the fall of 19 and terminated in summer of 1965. Objectives study were to (1) determine whether particu water table regimes are associated with specific s types, (2) achieve the capability for apprais water table regimes from soil morphological inf mation, and (3) gain background knowled needed in the development of prediction meth for water table depths, soil moisture contents, a soil strengths. Data obtained daily at each site cluded maximum and minimum air temperatur precipitation, groundwater depths, and electr

esistance measurement of soil moisture content nd temperature. Data obtained periodically in-luded gravimetric soil moisture contents, soil trengths, and the state of the ground and vegeta-on. Data on Atterberg limits, grain-size distribu-ons, specific gravities, organic matter contents, oisture contents at specified tensions, dry densi-es, site descriptions, and soil profile descriptions ave been condensed and presented in tabular and raphic form. Analysis of data is presented in Vol . (Spivey-WES)

YDROLOGIC RECONNAISSANCE OF THE NK VALLEY AREA, TOOELE AND BOX LDER COUNTIES UTAH,
eological Survey, Salt Lake City, Utah.
on Price, and E. L. Bolke.
tah Department of National Resources Technical ublication No 26, 1970. 34 p, 3 fig, 1 plate, 8 tab, 2 ref.

escriptors: *Groundwater basins, *Water sources, *Hydrogeology, *Deserts, *Utah, roundwater, Water balance, Water quality, ydrologic data, Data collections, Recharge, ischarge (Water).
entifiers: Sink Valley (Utah).

he Sink Valley (Puddle Valley) area covers about 0 square miles between Great Salt Lake and the reat Salt Lake Desert in northwestern Utah. It is a y, sparsely populated area utilized partly as a ilitary reservation and partly as winter range for eep. Normal annual precipitation in the area nges from less than 6 inches in the lowlands to a aximum of about 12 inches in the mountains. ecause of a high potential evaporation (estimated be about 58 inches a year), there is virtually no erland runoff from the area and very little oundwater recharge. All streams in the area are y most of the year. The principal source of water groundwater that occurs chiefly under water ole conditions in unconsolidated and partly con-lidated Quaternary and Tertiary valley fill. Sand d gravel aquifers in the valley fill yield as much as ew hundred gallons of water per minute to wells. owever, the water generally contains more than 000 mg/liter of dissolved solids, and mineral con-nt of the water increases with depth. The prin-pal dissolved constitutents generally are sodium d chloride. In 1967, about 37 acre-feet of water s pumped and demineralized for domestic pply at the Hill Air Force Range. An average of out 1.5 acre-feet per year is pumped for stock. e annual recharge is about 1,000 acre-feet. tural discharge from the reservoir, which occurs tirely as subsurface outflow, is also about 1,000 re-feet per year. The small quantity and the poor ality of the water are the principal limiting fac-s in any major development of water resources Sink Valley and the adjacent areas. (Knapp-GS)

THE QUESTION OF THE ORIGIN OF THE STEIN THERMAL WATERS, (ZUR FRAGE DER HERKUNFT DES GASTEINER THERMAL-WASSERS),
Innsbruck Univ. (Austria). Balneology Inst.; and Society of Hydrogeological Scientists, Graz (Austria).
C. Job, and J. Zotl.
Steirische Beitrage Zur Hydrogeologie, Graz, 1969, (Separate printing). 115 p, 19 fig, 11 tab, 33 ref.

Descriptors: *Thermal water, *Mineral water, *Hot springs, *Water circulation, Provenance, Water chemistry, Mineralogy, Tracers, Radioisotopes, Stable isotopes, Recharge, Discharge (Water), Water yield.
Identifiers: *Gastein (Austria), *Austria.

The cold waters of the Gastein area do not penetrate deep into the mountainous body and run off close to the surface, and are simple Ca-bicarbonate waters. As the depth of infiltration increases, sulfates created by the oxidation of sulfidic ores become predominant, and the Na-content of the waters increases by Ca/Na-exchange; the water in deep situated joints then contains all the ions typical of the Gastein thermal waters, except the chlorides. Chemical content as well as tritium content showed that springs may increase their yield by increased hydrostatic pressure in the recharge area. There is also fluctuating discharge of the pure deep thermal waters. The delta C-14 values of the carbonates of the hot waters closely approach the ideal value for vadose waters, from which it may be concluded that biogenic CO2 took an essential part in the dissolution of these carbonates and that, therefore, the main body of the Gastein thermal waters is infiltrated precipitation water. This result is confirmed by the C-14 analyses. (Knapp-USGS)

A PROBLEM OF SUBSIDENCE IN A LIMESTONE TERRANE AT COLUMBIANA, ALABAMA,
Geological Survey, University, Ala. Water Resources Div. and Geological Survey of Alabama, University.
W. J. Powell, and P. E. LaMoreaux.
Alabama Geological Survey Circular 56, 1969. 30 p, 22 fig, 1 ref.

Descriptors: *Land subsidence, *Withdrawal, *Limestones, *Alabama, Aquifers, Subsidence, Karst, Faults (Geology), Pumping, Municipal water, Water yield, Aquifer characteristics, Carbonate rocks.
Identifiers: *Columbiana (Ala).

The effects and possible causes of subsidence at Columbiana, Alabama, were studied to aid in suggesting a means of preventing further subsidence in the area. The subsidence damaged several buildings, a Federal housing project, endangered the concrete filter plant and elevated water storage tank, broke water lines, and severed the tracks of the Louisville and Nashville Railroad. The area most seriously affected by subsidence was at the site of the municipal water filter plant. Subsidence is common in areas underlain by limestone. At Columbiana, most of the subsidence was confined to the material above the limestone in a zone consisting of clay, shale, slate, sand, and gravel, and occurred in an area adjacent to the trace of the Wilsonville fault. Removal of silt, sand, calcareous and colloidal material by groundwater movement reduced the bearing strength of the overlying material. Continuous pumping from municipal wells 1 and 2 has created a cone of depression in the groundwater reservoir causing groundwater to move from all sides of this depression toward the center. The sediment present in the muddy water pumped from municipal wells 1 and 2 evidently is material removed primarily from the zone above bedrock. Development of 2 municipal wells at Kewahatchie Spring about 8 miles southeast of Columbiana will alleviate the water shortage and help alleviate subsidence. If pumping is continued from wells 1 or 2, even on a temporary basis, additional subsidence could be triggered. Surface cracks, particularly in the vicinity of well 2, should be filled. (Knapp-USGS)

A SIMPLE METHOD OF GROUNDWATER DIRECTION MEASUREMENT IN A SINGLE BORE HOLE,
Irrigation Research Inst., Lahore (Pakistan).
Mohammad Saleem.
Journal of Hydrology, Vol 12, No 4, p 387-410, Mar 1971. 24 p, 11 fig, 2 ref, 2 append.

Descriptors: *Groundwater movement, *Tracers, *Tracking techniques, *Water wells, Aquifers, Flow, Porous media, Boreholes, Subsurface investigations.
Identifiers: *Groundwater tracing.

A simple tracer technique may be used to find both the magnitude and direction of groundwater flow in a single borehole sited in a pervious water bearing medium. At any given horizon where velocity measurements are required, the strainer of the borehole is divided into three regions, each about 10 cm long. The central region has slits all around. The top region consists of two equal semicircular halves, each subtending an angle of 180 degrees at the axis of the strainer, and one-half has slits cut in it as usual while the second half is kept completely closed. The lower region is similarly constructed to the top one except that its reference line leads or lags behind the reference line of the top region by an angle of 45 degrees. For proper separation of these three regions, there are buffer zones between any two consecutive regions. Inactive potassium bromide solution is injected in all the three regions. Using three independent brass electrodes, one in each of the three regions, electrical conductivities at regular intervals of time are carried out by using low frequency and low voltage alternating current, the common electrode being the strainer itself. The magnitude of flow can be determined from the information collected from the central region; the data from the top and lower regions give the direction of flow. (Knapp-USGS)

DIGITAL COMPUTER SOLUTIONS OF GROUNDWATER FLOW,
Birmingham Univ. (England). Dept. of Civil Engineering.
K. R. Rushton, and L. M. Tomlinson.
Journal of Hydrology, Vol 12, No 4, p 339-362, Mar 1971. 24 p, 11 fig, 1 tab, 8 ref, 2 append.

Descriptors: *Groundwater movement, *Numerical analysis, *Computer programs, Hydrogeology, Flow, Porous media, Recharge, Infiltration, Withdrawal, Networks, Digital computers, Mathematical models, Model studies, Analog models.
Identifiers: Implicit methods.

This paper examines critically the use of the alternating direction implicit method for solving groundwater flow problems. Comparisons with alternative solutions show that inaccuracies can arise if the time increments are too large. A method is suggested whereby the computer chooses an optimum time increment. The representation of recharge, infiltration and wells is considered and a detailed example compares the alternating direction implicit, the explicit and the resistance-capacitance network methods. TWO DIMENSIONAL HEAT TRANSFER IN POROUS MEDIA WITH STEADY-STATE WATER FLOW,
California Univ., Davis. Dept. of Water Science and Engineering.
K. T. Erh, D. R. Nielsen, and J. W. Biggar.
Soil Science Society of America Proceedings, Vol 35, No 2, p 209-214, Mar-Apr 1971. 6 p, 12 fig, 1 tab, 18 ref.

Descriptors: *Heat transfer, *Soil water movement, *Porous media, Clays, Saturated flow, Conduction, Diffusion, Heat flow, Mass transfer, Thermal conductivity, Instrumentation, Laboratory tests, Mixing, Water temperature.

Identifiers: Apparent thermal conductivity.

Theoretical and experimental temperature distributions were examined for laboratory columns of Hanford sandy loam, Panoche clay loam, and Aiken clay saturated with water flowing at a constant rate. The temperature of the water entering the columns was kept below or above the ambient temperature for several values of soil water velocity. Temperature distributions were predicted as a function of flow velocity, radial size, apparent thermal conductivity, and the wall heat transfer coefficient of the cylindrical container for the soil. Values of the apparent axial and radial thermal conductivity depend upon the flow velocity at values less than 0.3 cm per min with only one exception. The value of the axial thermal conductivity was 1.1 greater than that of the radial thermal conductivity for all soils and flow velocities. Increasing the soil column radius had the same effect on the temperature distributon as increasing the water velocity. (Knapp-USGS)

WATER LEVELS IN ARTESIAN AND NONARTESIAN AQUIFERS OF FLORIDA, 1967-68,
Geological Survey, Tallahassee, Fla.
Henry G. Healy.
Florida Bureau of Geology Information Circular No 68, 1971. 61 p, 51 fig, 1 tab.

Descriptors: *Florida, *Aquifers, *Groundwater, *Artesian wells, *Hydrologic data, Water level fluctuations, Hydrographs, Observation wells, Precipitation (Atmospheric), Rainfall, Chlorides, Confined water, Data collections.
Identifiers: Groundwater data (Fla).

This report summarizes the trends and fluctuations of groundwater levels in the principal aquifers in Florida during 1967-68 and includes: (1) hydrographs of groundwater levels in the several aquifers; (2) maps showing changes in groundwater levels during specific periods; and, (3) a table summarizing the principal data on selected observation wells. The locations, aquifers, and types and periods of records available for 3,600 observation wells are tabulated. (Josefson-USGS)

GROUNDWATER RESOURCES OF ARANSAS COUNTY, TEXAS,
Geological Survey, Austin, Tex.
G. H. Shafer.
Published and distributed by the Texas Water Development Board, PO Box 13087, Austin, Texas 78711. Texas Water Development Board Report 124, Dec 1970. 81 p, 22 fig, 10 tab, 32 ref.

Descriptors: *Water resources development, *Groundwater, *Hydrogeology, *Hydrologic data, *Texas, Data collections, Water resources, Aquifers, Aquifer characteristics, Water levels, Water level fluctuations, Water yield, Water wells, Water quality, Salinity, Consumptive use, Chemical analysis, Irrigation, Industrial water, Domestic water.
Identifiers: *Aransas County (Tex).

The aquifers that yield water to wells in Aransas County, Texas are the Gulf Coast aquifer, mostly of Pliocene and Pleistocene age, that underlies the entire county; the Pleistocene barrier island and beach deposits, which are restricted to the peninsulas; and the Holocene barrier island deposits, which are restricted to St. Joseph Island. Almost all groundwater needed for public supply and industrial use is obtained from the Gulf Coast aquifer that underlies Live Oak Peninsula. During 1966, about 1,600 acre-feet of groundwater was pumped for all purposes in the county. About 672 acre-feet was for public supply, 342 acre-feet for industrial use, and 580 acre-feet for rural domestic and livestock use. One of the principal factors limiting the development of moderate supplies of groundwater is the threat of salt-water intrusion from sands underlying the fresh-water zone. The most satisfactory method of disposal of salt water is by the use of injection wells, but in 1961 only 500 barrels (0.06 acre-foot) of salt water produced from oil wells in Aransas County was disposed by this method. (Woodard-USGS)

GROUNDWATER IN ONTARIO, SOUTH-EASTERN AREA, 1960 TO 1964.
Ontario Water Resources Commission, Toronto. Div. of Water Resources.

Ontario Water Resources Commission, Water Resources Bulletin 2-8, Groundwater Series, 1970. 307 p, 2 fig, 8 tab, 4 append.

Descriptors: *Water resources, *Groundwater, *Hydrologic data, *Data collections, Water wells, Geology, Aquifers, Aquifer characteristics, Hydrology, Topography, Meteorology, Drainage, Hydrogeology, Water sources, Water level fluctuations, Observation wells, Water utilization, Water resources development.
Identifiers: *Ontario (Canada), Well logs, Well data.

This report contains groundwater information assembled for the southeastern area of Ontario for the period 1960 to 1964. The information is directed to individuals interested in groundwater conditions in areas where they wish to drill wells; by drillers who are interested in hydrogeologic conditions in areas other than where they normally operate; by town planners, engineers, and geologists, who are searching for major aquifers to supply municipalities with groundwater; and by engineers, geologists and others who are seeking favorable sites for gravel pits, quarries, or other deposits of economic value. The western part of the area mainly in the counties of Renfrew and Frontenac and partly in the counties of Leeds and Lanark, is underlain predominantly by Precambrian rocks and the topography is quite variable. The elevation varies from an altitude of about 240 feet at the St. Lawrence River near Brockville, to a height of 1,725 feet above sea level southeast of Killaloe Station. In the eastern part of the area the land is underlain by Paleozoic rocks. Here, the elevation varies from an altitude of 73 feet at the Ottawa River at the eastern edge of the Province to a height of 480 feet near the Hamlet of Algonquin in the head waters of the South Nation River. The observation wells (78) are listed by county. Well descriptions and water-level measurements are given. (Woodard-USGS)

GROUNDWATER OF SOUTHEASTERN VIRGINIA.
Virginia Dept. of Conservation and Economic Development, Charlottesville. Water Resources Div.

Virginia Division Water Resources Planning Bulletin, 262, 1970. 54 p, 25 plates, 2 tab, 37 ref.

Descriptors: *Water resources development, *Virginia, Groundwater, Water yield, Aquifers, Recharge, Water management (Applied), Planning, Water levels, Water table, Withdrawal.
Identifiers: Southeastern Virginia.

Groundwater in southeastern Virginia is obtained from both water table and artesian aquifers. The deep artesian system is the principal source of water. Pumpage has increased, principally in the Franklin area, from about one mgd in 1939 to about 46 mgd in 1969, and now is exceeding natural replenishment. Other cones of depression are developing. A continuing overdraft may result in serious groundwater supply difficulties in southeastern Virginia, and recommendations are offered to deal with the problem. (Knapp-USGS)

EFFECT OF SOIL MOISTURE HYSTERESIS ON THE WATER TABLE PROFILE AROUND A GRAVITY WELL,
Nevada Univ., Reno. Plant, Soil, and Water Science Div. and California Univ., Davis. Dept. of Water Science and Engineering.
J. C. Guitjens, and James N. Luthin.
Water Resources Research, Vol 7, No 2, p 334-346, Apr 1971. 13 p, 8 fig, 2 tab, 21 ref, 3 append.

Descriptors: *Hysteresis, *Soil water movement, *Drawdown, *Water table, *Water level fluctuations, Withdrawal, Surface-groundwater relationships, Infiltration, Seepage, Recharge, Soil moisture, Specific capacity, Time lag, Aquifer characteristics, Groundwater movement.
Identifiers: *Soil moisture-groundwater relations, *Gravity wells.

Gravity wells, pumped intermittently, can have different degrees of drainage in the unsaturated zone at the onset of water table recovery. Each part of the aquifer profile follows a specific curve of rewetting. Measured hysteresis of fine sand and hydraulic conductivity as a function of moisture content are incorporated in the partial differential equations for steady and unsteady radial flow to solve for the soil moisture pressure distribution of water table drawdown and three different kinds of recovery. The method of independent domain describes hysteresis and accounts for a gradual release and uptake of water rather than constant changes based on the concept of specific yield. Small differences between the computed values of the three water table recoveries, each one starting at a different degree of drainage in the zone above the water table, are probably due to the relatively small unsaturated portion of the aquifer profile. THREE-DIMENSIONAL, TRANSIENT, SATURATED-UNSATURATED FLOW IN A GROUNDWATER BASIN,
Thomas J. Watson Research Center, Yorktown Heights, N.Y.
R. Allan Freeze.
Water Resources Research, Vol 7, No 2, p 347-366, Apr 1971. 20 p, 11 fig, 34 ref.

Descriptors: *Groundwater basins, *Hydrogeology, *Mathematical models, *Simulation analysis, *Numerical analysis, Groundwater movement, *Aquifers, Surface-groundwater relationships, Saturated flow, Rainfall-runoff relationships, Water yield, Safe yield, Computer programs, Water levels, Hydraulic gradient, Unsteady flow, Base flow, Water balance.
Identifiers: Transient flow.

A three-dimensional finite difference model was developed for the treatment of saturated-unsaturated transient flow in small nonhomogeneous, anisotropic geologic basins. The model includes the unsaturated zone in a basin-wide model that can also handle both confined and unconfined saturated aquifers, under both natural and developed conditions. The integrated equation of flow is solved by the line successive overrelaxation technique. The model allows any generalized region shape and any configuration of time variant boundary conditions. When applied to natural flow systems, the model provides quantitative hydrographs of surface infiltration, groundwater recharge, water table depth, and base flow. Results of simulations for hypothetical basins provide insight into the mechanisms involved in the development of perched water tables. The unsaturated basin response is the controlling factor in determining the nature of the base flow hydrograph. Application of the model to developed basins allows simulation of the manner in which groundwater withdrawals are transmitted through the aquifers, and the changes in the rates of groundwater recharge and discharge induced by the withdrawals. For any proposed pumping pattern, it is possible to predict the maximum basin yield that can be sustained by a flow system in equilibrium with the recharge-discharge characteristics of the basin. GROUNDWATER CONDITIONS IN SOUTHERN UTAH VALLEY AND GOSHEN VALLEY, UTAH,
Geological Survey, Salt Lake City, Utah.
M. M. Cordova.
Copies of report available at Utah Dept of Natural Resources, Division of Water Rights, 442 State Capitol, Salt Lake City, Utah. Utah Department of Natural Resources Technical Publication No 28, 1970. 79 p, 29 fig, 4 plate, 14 tab, 20 ref.

Descriptors: *Groundwater, *Aquifers, *Water sources, *Groundwater recharge, *Utah, Wells, Artesian wells, Water balance, Irrigation, Water level fluctuations, Evapotranspiration, Seepage, Sewage disposal, Subsurface flow, Water resources development, Groundwater basins.
Identifiers: Groundwater temperature, Chemical quality, Central Utah Project, Utah Valley, Goshen Valley (Utah).

The valley fill in southern Utah Valley and Goshen Valley includes four main aquifers--a water-table aquifer and three artesian aquifers. The minimum estimate of recharge in 1966 was 150,000 acre-ft. The minimum estimate of discharge in 1966 was 220,000 acre-feet of which about 29,000 acre-ft was withdrawn from storage in the aquifer. Important factors that should be considered in managing the groundwater reservoir include increased withdrawal of water from wells, wastage of water from flowing wells, saltcedar infestation, sewage disposal, and the Central Utah Project. A quantitative evaluation of the actual effects of operating the Central Utah Project can be made only by a comprehensive water-resources study of the entire Utah Lake Valley. (Josefson-USGS)

ROOT ELONGATION RATES OF COTTON AND PEANUTS AS A FUNCTION OF SOIL STRENGTH AND SOIL WATER CONTENT,
Alabama Agricultural Experiment Station, Auburn.
H. M. Taylor, and Larry F. Ratliff.
Soil Science, 1969, Vol 108, No 2, p 113-119. 8 fig, 2 tab, 6 ref.

Descriptors: *Cotton, *Peanuts, *Soil strength, *Moisture content, *Root development, Resistance, Soil moisture, Soil-water-plant relationships, Plant growth, Root distribution.
Identifiers: *Soil-water potential, Penetrometer, Soil suction, Matric suction.

This research investigates the soil water content and soil matric suction effects on root elongation rates. Cotton and peanut root elongation rates decreased as soil strengths increased. Soil strengths were measured with a penetrometer. The relation between elongation rate and penetrometer resistance was not affected by 0.17 to 7.0 bars soil suction for cotton and 0.19 to 12.5 bars for peanuts. Root diameter increased with soil water content, particularly at low soil strengths. Figures and tables relate penetrometer resistance, root length, soil moisture, and time for cotton and peanut roots. (Popkin-Arizona)

WATER DYNAMICS IN CLAYS BY NEUTRON SPECTROSCOPY,
Sydney Univ. (Australia). Dept. of Physical Chemistry.
R. J. Hunter, G. C. Stirling, and J. W. White.
Nature Physical Science, Vol 230, No 17, p 192-194, Apr 26, 1971. 3 p, 2 fig, 11 ref.

Descriptors: *Groundwater movement, *Clays, *Water chemistry, *Neutron activation analysis, *Spectroscopy, Soils, Soil dynamics, Analytical techniques, Soil water movement.

The behavior of water near solid surfaces is of current interest and, in particular, much attention has been paid to the water-clay interaction in layered alumino silicates. Experimental results show that neutron spectroscopy can be a valuable method for elucidating the behavior of water molecules very close to solid surfaces, with layered silicate structures providing a particularly useful model system in which the thicknesses and other properties of the water films can be precisely controlled. (Woodard-USGS)

SOIL STRUCTURE AND HYDRAULIC CONDUCTIVITY OF ADJACENT VIRGIN AND CULTIVATED PEDONS AT TWO SITES: A TYPIC ARGIUDOLL (SILT LOAM) AND A TYPIC EUTROCHREPT (CLAY),
Wisconsin Univ., Madison. Geological and National History Survey; and Wisconsin Univ., Madison. Dept. of Soil Science.
J. Bouma, and F. D. Hole.
Soil Science Society of America Proceedings, Vol 35, No 2, p 316-319, Mar-Apr 1971. 4 p, 1 fig, 1 tab, 15 ref.

Descriptors: *Hydraulic conductivity, *Soil water movement, *Soil structure, *Soil management, Cultivation, Cultivated lands, Soil physics, Soil horizons, Soil types.

Soil morphology and hydraulic conductivity (K) of principal soil horizons of paired virgin and cultivated soil pedons were studied at two sites: a Tama silt loam (Typic Argiudoll) and an Oshkosh clay (Typic Eutrochrept). About a century of cultivation had led to reduction of K (measured by the Bouwer double-tube method) in the upper part of the solum below the Ap. Corresponding changes in soil morphology are noted. The reductions in K are paralleled by increases in bulk density and decreases in porosity and organic matter content in the soil horizons. At a depth of 80 to 90 cm in the clay soil, K increased apparently as a result of formation of interpedal voids as the alfalfa crop (Medicago sativa L.) extracted moisture. (Knapp-USGS)

PHYSICO-CHEMICAL PROPERTIES OF SOLS AND GELS OF Na-MONTMORILLONITE WITH AND WITHOUT ADSORBED HYDROUS ALUMINUM OXIDE,
Purdue Univ., Lafayette, Ind. Dept. of Agronomy.
Brian G. Davey, and Philip F. Low.
Soil Science Society of America Proceedings, Vol 35, No 2, p 230-236, Mar-Apr 1971. 7 p, 7 fig, 31 ref.

Descriptors: *Gels, *Montmorillonite, *Water chemistry, *Adsorption, Clay minerals, Ion exchange, Soil chemical properties, Mineralogy, Soil strength.
Identifiers: Sols.

Sodium-montmorillonite was prepared with and without adsorbed hydrous aluminum oxide. The two clays were mixed with NaCl solution in different proportions. The clay content at which gelation began, as indicated by an increase in viscosity and the initiation of non-Newtonian and hysteretic behavior, was lower for the Na/Al-clay than for the Na-clay. Theoretical considerations indicated that both strong and weak bonds were present in the sols. Specific heat capacities were found to differ from those calculated from the known proportions and specific heat capacites of clay and water. Differences were greater for the Na/Al- than for the Na-clay. These differences could be attributed to clay-water interaction. The relative partial molar free energy of NaCl changed with clay content in somewhat different ways for the Na/Al- and Na-clay mixtures. Adsorbed hydrous aluminum oxide influence the physico-chemical properties of sols and gels of Na-montmorillonite. (Knapp-USGS)
W71-07275

MEASURING SOIL MATRIC POTENTIAL IN SITU BY SENSING HEAT DISSIPATION WITHIN A PROUS BODY: II. EXPERIMENTAL RESULTS,
Agricultural Research Service, Riverside, Calif. Salinity Lab.
C. J. Phene, S. L. Rawlins, and G. J. Hoffman.
Soil Science Society of America Proceedings, Vol 35, No 2, p 225-229, Mar-Apr 1971. 5 p, 4 fig, 8 ref.

Descriptors: *Soil moisture meters, *Heat transfer, *Moisture tension, Pore pressure, Soil water, Soil moisture, Instrumentation, Telemetry.
Identifiers: *Matric potential, *Psychrometers.

A sensor designed to measure the matric potential of soil water in situ was tested in soil-plant systems. In the field, temperatures obtained by the sensor were used to predict optimum time for measurement to avoid error caused by diurnal temperature drift in the soil. The error caused by temperature drift was eliminated completely by using two matched diode sensors and taking a temperature difference measurement. The accuracy of the matric potential sensor proved to be as good as or better than that of other techniques used to measure matric potential. Sensors with high sensitivity in the 0 to -2 bar matric potential range had an accuracy of 0.2 bar. The accuracy decreased progressively to 1 bar at a matric potential of -10 bars. (Knapp-USGS)
W71-07276

SOIL-WATER HYSTERESIS: THE DOMAIN THEORY EXTENDED TO PORE INTERACTION CONDITIONS,
Department of Agriculture, Ottawa (Ontario). Soil Research Inst.
G. C. Topp.
Soil Science Society of America Proceedings, Vol 35, No 2, p 219-225, Mar-Apr 1971. 7 p, 10 fig, 13 ref.

Descriptors: *Wetting, *Soil water movement, *Hysteresis, Porous media, Infiltration, Percolation.
Identifiers: Independent domain theory.

Some inadequacies of the independent domain theory of hysteresis were overcome by modifying an extension to the theory to include two types of pore interactions. In the independent domain theory only the shapes of the pores determined the draining and filling characteristics of each pore. In this extension to the theory, the draining and filling of each pore depends on the state of neighboring pores as well as the pore geometry. The ratios of changes in water content of the soil during drying and rewetting over a given pressure head range were used to determine the importance of pore interactions and to separate the two types of pore blockage. Primary scanning curve data for porous materials ranging from glass beads to clay loam soil showed that pore blockage against air-entry during drying of a soil near saturation and pore blockage against water-entry during rewetting of a relatively dry soil were the two major types of pore interactions. The degree of pore blockage appeared to be dependent only on the water content of the soil. (Knapp-USGS)
W71-07277

MEASUREMENT OF ATTENUATION OF Cs-137 AND Am-241 GAMMA RAYS FOR SOIL DENSITY AND WATER CONTENT DETERMINATIONS,
Du Pont de Nemours (E. I.) and Co., Aiken, S.C. Savannah River Lab.
J. C. Corey, S. F. Peterson, and M. A. Wakat.
Soil Science Society of America Proceedings, Vol 35, No 2, p 215-219, Mar-Apr 1971. 5 p, 4 fig, 3 tab, 9 ref.

Descriptors: *Nuclear moisture meters, *Gamma rays, *Expensive soils, Soil water movement, Soil density, Soil moisture meters, Instrumentation, Calibrations.
Identifiers: *Nuclear soil density meters.

A 400-channel pulse-height analyzer was shown to be adequate for determining the attenuation of a collimated gamma beam from a combined Am-241 and Cs-137 source. The method can be used to calculate the water content and soil density of either swelling or nonswelling soils. Soil density and water content can be determined concurrently by measuring the attenuation of two different gamma energies. With the multichannel pulse-height analyzer, it was simpler to adjust the area under the americium peak for the Compton contribution from the cesium radiation than with a single channel pulse-height analyzer. (Knapp-USGS)
W71-07278

THE DIFFUSION AND CONSUMPTION OF OXYGEN IN SUBMERGED SOILS,
Cornell Univ., Ithaca, N.Y. Dept. of Agronomy.
R. H. Howeler, and D. R. Bouldin.
Soil Science Society of America Proceedings, Vol 35, No 2, p 202-208, Mar-Apr 1971. 7 p, 5 fig, 6 tab, 14 ref.

Descriptors: *Oxygen demand, *Aquatic soils, *Bottom sediments, Oxidation, Iron, Chemical oxygen demand, Oxygen, Aeration, Dissolved oxygen, Soil gases.
Identifiers: Submerged soils.

Six oxygen diffusion models were evaluated by measuring consumption rates under conditions which approached the steady state and under transient-state conditions. Consumption rates under approximately steady-state conditions were determined by placing undisturbed lake-bottom cores in water and measuring the decrease in oxygen concentration of the water. Transient-state consumption rates were determined from the amount of oxygen gas that had to be injected above an initially reduced soil to maintain a constant concentration at the soil surface. The distribution of extractable Fe in the cores was obtained by sectioning frozen soil cores and extracting the sections with NaOAc at pH 2.8 and with dithionite in EDTA. Considerable amounts of Fe (..2) WERE FOUND TO DIFFUSE FROM THE REDUCED ZONE TO THE OXIDIZED ZONE WHERE IT ACCUMULATED AS PRECIPITATED Fe (..3). The oxygen consumption was best described by models which included consumption by microbial respiration in the aerobic zone and oxidation of mobile and nonmobile reductants such as Fe (..2). (Knapp-USGS)
W71-07280

T1-208 AND Na-24 GAMMA SOURCES FOR IDENTIFYING SOIL WATER TAGGED WITH DEUTERIUM,
Du Pont de Nemours (E. I.) and Co., Aiken, S. C. Savannah River Lab.
R. H. Hawkins, R. F. Overman, and J. C. Corey.
Soil Science Society of America Proceedings, Vol 25, No 2, p 199-201, Mar-Apr 1971. 3 p, 2 fig, 8 ref. USAEC Contract AT (07-2)-1.

Descriptors: *Tracers, *Radioisotopes, *Soil water movement, Deuterium, Tracking techniques, Stable isotopes.
Identifiers: *Soil water tracers.

In situ tracing of soil water movement with the D2O Na-24 method is limited by the need to reactivate the Na-24 gamma source frequently (half-life of 15 hours) in a nuclear reactor. T1-208 produced the same neutron count rates from vials of D2O in dry and moist soils as did Na-24. The 1.9-year effective half-life of T1-208 in equilibrium with its parent nuclide Th-228 is a significant advantage over Na-24. Recent commercial availability of T1-208 sources now makes in situ D2O tracing of soil water feasible for investigators not having access to a nuclear reactor. (Knapp-USGS)

ONE-DIMENSIONAL GRAVITY DRAINAGE OF UNIFORM COLUMNS OF POROUS MATERIALS,
Agricultural Research Service, Phoenix, Ariz. Water Conservation Lab.
F. D. Whisler, and K. K. Watson.
Journal of Hydrology, Vol 6, No 3, p 277-296, 1968. 20 p, 14 fig, 12 ref.

Descriptors: *Soil water movement, *Infiltration, *Percolation, *Porous media, *Numerical analysis, Computer programs, Equations, Soils, Gravity, Hydraulic conductivity, Pressure head, Hydrology, Permeability, Recharge, Drainage, Withdrawal, Groundwater movement, Artificial recharge, Water spreading, Saturated flow, Water table.

A numerical analysis of the one-dimensional gravity drainage problem uses the pressure head form of the differential equation of flow. The analysis is programmed for solution by a digital computer and was tested against several sets of published experimental data with known hydrologic characteristics of porous material, and time profiles of pressure head and water content. The numerical approach was then used to investigate physical aspects of the drainage process. Problems involving intermittent inundation sequences were applied to deep sand profiles in groundwater recharge operations. The drainage of the saturated profile constitutes the first and simplest phase of an increasingly complex situation as the watering schedules develop. (Woodard-USGS)

GAZETTEER OF LOUISIANA LAKES AND RESERVOIRS,
Geological Survey, Baton Rouge, La.
William J. Shampine.
Louisiana Department of Public Works Basic Records Report No 4, 1970. 31 p, 3 fig, 3 tab, 5 ref.

Descriptors: *Hydrologic data, *Lakes, *Reservoirs, *Louisiana, *Data collections, Surface waters, Lake morphology, Lake morphometry, Water resources development, Water utilization.
Identifiers: Basic-data compilation (Lakes).

There are more than 2,400 square miles of lake and reservoir surface area in Louisiana, which provide excellent opportunities for recreational, industrial, municipal, and agricultural usage. These lakes constitute a very significant part of the State's total water resources and are an integral part of the hydrology of many drainage basins. Physical data for all lakes and reservoirs having a surface area of 25 square mile or more are tabulated. Included are location, drainage area, elevation, surface area, volume, use, and outlet. Available basic data are listed. Lakes larger than 1 square mile are ranked in order of size. (Woodard-USGS)

A HYDROLOGIC MODEL OF THE LAKE ONTARIO LOCAL DRAINAGE BASIN,
Department of Energy, Mines and Resources, Ottawa (Ontario). Inland Waters Branch.
D. F. Witherspoon.
Canada Dept of Energy, Mines and Resources, Inland Waters Branch, Technical Bulletin No 31, 1970. 12 p, 3 fig, 1 tab, 13 ref.

Descriptors: *Mathematical models, *Lake Ontario, *Hydrology, *Water balance, Precipitation (Atmospheric), Evaporation, Albedo, Temperature, Wind, Humidity, Runoff, Surface-groundwater relationships, Mathematical studies, Inflow, Discharge (Water), Evaluation, Routing.
Identifiers: Hydrologic models.

A mathematical model based on the water and energy balances is proposed for the Lake Ontario local drainage basin (27,100 square miles, comprising the entire local contributing area except for the lake's water surface area of 7,500 square miles). Using a hypothesis which provides estimates of the annual regional evaporation, regional moisture values are obtained which, when routed, simulate the measured monthly outflows from the land area. The model provides a means for studying the hydrology of the basin, simulation of long periods of record and basic relationships which can be used in developing forecasting techniques. Two analyses were performed to determine whether the model provided a good representation of the outflow from the local contributing area to the lake. In the first, the cumulative measured outflow was plotted on a time base with the cumulative computed outflow. Good agreement was achieved. The annual values of measured and computed outflow were plotted on the basis of a September through August water year. This water year was chosen with reference to the measured outflows which consistently showed that the lowest flows occur in August. As a result of a correlation of the annual values, the correlation coefficient was 0.92, with a standard error of 0.03. (Woodard-USGS)

CHARACTERISTICS OF NEW YORK LAKES: PART 1 - GAZETTEER OF LAKES, PONDS, AND RESERVOIRS,
Geological Survey, Albany, N. Y.
Phillip E. Greeson, and F. Luman Robison.
New York State Department of Environmental Conservation Bulletin 68, 1970. 124 p, 2 fig, 1 plate, 5 tab, 3 ref.

Descriptors: *Lakes, *Ponds, *Reservoirs, *Documentation, *New York, Surface waters, Sites, Hydrologic data, Lake morphology, Surveys, Lake morphometry.
Identifiers: *New York lakes, Lake characteristics.

New York State has more than 4,000 lakes, ponds, and reservoirs. The gazetteer is an alphabetical listing of all lakes in the State having a surface area greater than 0.01 square mile and includes the following characteristics of each lake: name, county, number of counties in which the lake is located, quadrangle, number of quadrangles on which the lake is located, major and minor drainage basins, latitude, longitude surface elevation, drainage area, surface area, length of shoreline and volume. Over 800 unnamed ponds are included in the gazetteer. An alphabetical list is given of the topographic quadrangles coded to an index map showing location of the various topographic maps and the major surface water features. The lakes constitute a very significant part of the State's total water resources and are an integral part of the hydrology of the drainage basins. (See also W71-07185 and W71-07186) (Woodard-USGS).
W71-07297

DYNAMICS OF NUTRIENT CONCENTRATIONS IN THE ILLINOIS RIVER,
Illinois State Water Survey, Peoria. Water Quality Section.
Wun-Cheng Wang, and Ralph L. Evans.
Journal Water Pollution Control Federation, Vol 42, No 12, p 2117-2123, Dec 1970. 6 fig, 2 tab, 14 ref.

Descriptors: *Nitrates, *Phosphates, *Path of pollutants, *Surface runoff, Water temperature, Hydrogen ion concentration, Turbidity, Illinois, Dissolved oxygen, Alkalinity, Hardness (Water), Iron, Fluorides, Silica, Ammonia, Organic compounds, Nitrogen, Statistical methods, Flow rates.
Identifiers: *Peoria Lake (Illinois), Orthophosphates, Polyphosphates.

The dynamics of the concentration of certain minerals in a sector of the Illinois River were investigated. Use was made of the background concentration of fluoride in the stream as a reference source for defining the effect of stream flow on the mineral concentrations. Fluoride and orthophosphate-P concentrations decreased as stream flow increased. The ratio of orthophosphate-P to fluoride remained reasonably constant regardless of flow. The ratios of nitrate-N fluoride and organic-N fluoride increased as stream flow increased. The concentration-flow patterns strongly support the contention that a major source of nitrogen to the study area is derived from surface runoff whereas phosphorus from the same source is minimal. (Little-Battelle)

ANNUAL TEMPERATURE VARIATIONS IN AN IMPOUNDMENT IN CENTRAL ILLINOIS,
Illinois State Water Survey, Peoria.
V. Kothandaraman, and Ralph L. Evans.
Journal American Water Works Association, Vol 62, No 10, p 639-642, Oct 1970. 5 fig, 3 tab, 9 ref.

Descriptors: *Thermal stratification, *Computer models, *Temperature, Epilimnion, Lakes, Model studies, Impoundments.
Identifiers: *Lake Bloomington, *Temperature prediction model, Harmonic temperature gradient.

A harmonic equation is found to be an excellent representation of the annual temperature variations at all depths in a lake. A computer program is developed to evaluate the components of the harmonic using a continuous and equally spaced temperature record covering a period of at least one year. Summer stratification in the lake under study appears to persist from June to September. At sections of the lake with depths greater than 20 ft., all the three characteristic zones of summer stratification were observed. On the other hand, at sections with depths less than 20 ft., there was either no stratification, or the stratification consisted of a small but regular temperature gradient of about 5 to 15F from top to bottom. It would appear that the limiting depth of the epilimnitic zone in Lake Bloomington, as defined by temperature, is about 20 ft. (Oleszkiewicz-Vanderbilt)
W71-07443

DESTRATIFICATION EXPERIMENTS AT ROTTERDAM,
P. L. Knoppert, J. J. Rook, Tj. Hofker, and G. Oskam.
Journal American Water Works Association, Vol 62, No 7, p 448-454, July 1970. 11 fig, 2 tab, 13 ref.

Descriptors: *Thermal stratification, *Temperature, *Aeration, *Water quality, Thermocline, Mixing, Algae, Lakes.
Identifiers: *Artificial destratification, *Lake Maarsseveen, Zeeuws-Vlaanderen Reservoirs.

The experiments of Lake Maarsseveen showed that using compressed air as a method of artificial destratification permits the maintenance of a sharp thermocline at a chosen level. Also, these experiments showed that during artificial destratification, the thermocline sank to the same level over the entire lake, at any given time. Comparison of two techniques, for injecting air, an air bubble screen across the lake, and a single diffusor at one point, showed that the air bubble screen gave better results. From the Zeeuws-Vlaanderen experiment the tentative conclusion may be drawn that the depth of the lake in relation to optical characteristics of the water is an important parameter for the algal behavior of an impoundment, if the thermal conditions are modified artificially. REGULATION OF GREAT LAKES LEVELS AND FLOWS,
United States Lake Survey, Detroit, Mich.
B. G. DeCooke.
In: Great Lakes Water Resources Conference, Toronto, the Hydro-Electric Power Commission of Ontario, p 249-275, 1968.

Descriptors: *Cost-benefit analysis, *Lakes, *Statistics, *Economic evaluation, *Great Lakes, *Water supply, Precipitation, Runoff, Groundwater, Evaporation, Canals, Navigation, Time, Flooding, Erosion.
Identifiers: *Lake regulation, *Rule-and-limitation, *Stochastic approach, Regulation plans, Shore property.

A survey is made of the physical characteristics, hydraulics, and hydrology of the Great Lakes system, touching on such items as average lake levels, outflows, runoff, precipitation and evaporation. Both the rule and limitation approach and the stochastic approach to regulation plan development of water supplies are presented and compared. Specific plan examples are given for Lakes Superior and Ontario. The difficulties in regulation are discussed, including the natural hydrologic factors of precipitation, runoff, groundwater, and evaporation and the time lag difficulty in water supply. The interests of shore property, navigation, and power in the levels and outflows of the Great Lakes are also compared in terms of cost-benefit analysis to provide the economic justification for plan regulation. The basic objective of such regulation is the achievement of a regimen of lake levels and outflows giving consideration to both the beneficial and adverse effects on all the interests involved. STUDIES AND RESEARCH NEEDED IN REGULATION OF THE GREAT LAKES,
Wisconsin Univ., Milwaukee. Department of Energy, Mines and Resources, Ottawa (Ontario).
A. M. Becton, and H. B. Rosenberg.
In: Great Lakes Water Resources Conference, Toronto, the Hydro-Electric Power Commission of Ontario, p 311-342, 1968.

Descriptors: *Great Lakes, *Water supply, *Water resource development, *Water quality, Reservoir, Dams, Water levels, Recreation, Environment, Population, Waste disposal, Navigation, Optimization.
Identifiers: *Multi-disciplinary activity, Shore property.

The need is indicated for multi-disciplinary study and research to solve Great Lakes problems due to increasing population pressures and increasing demands on the resource from various interests. Some suggested areas for this approach are engineering, economics, biology, sociology, and law. These are justified by the close relationship between water problems and socioeconomic problems as seen in the areas of shore property, hydro-power, recreation, water supply, navigation, waste disposal, and water diversions. Future studies should encompass hydrologic trends from environmental changes to optimize water resource development. Research is needed to determine the effect of changes in water levels on plant, animal and human life. This would provide a means for realizing benefits from engineering works on the lakes that will serve to enhance water quality, recreational use, and fish and wildlife habitat. BOSMINA STRATIGRAPHY OF LAKE SEDIMENTS (FINNISH: JARVIKERROSTUMIEN BOSMINA-STRATIGRAFIASTA),
Pentti Alhonen.
Geologi (Finland), Vol 23, No 2, p 26-31, 1971. 6 p, 5 fig, 19 ref.

Descriptors: *Waterfleas, *Lakes, *Lake soils, *Sediment-water interfaces, Lake morphometry, Lake stages, Sediments, Plankton, Stratigraphy, Organic matter, Dystrophy, Crustaceans, Paleolimnology.
Identifiers: *Finland, *Lake sediments, Biostratigraphy, Ignition loss, Carbon-nitrogen ratio.

The stratigraphic distribution of Bosmina, a prevalent waterflea species of subfossil fauna of lake sediments, is examined for four northern Finnish lakes -- the Telkko, Sarkijarvi, Jarvenkylanjarvi and the Leppasjarvi. The four lakes of similar age are compared on the basis of Bosmina remains, calculated for one cubic centimeter of fresh sediment, ignition loss and the carbon/nitrogen ratio. Studies show that there is a marked increase in Bosmina production in the early stages of lake development but that a decrease in the stratigraphic fluctuation of the maxima is observed at later periods. It is suggested that Bosmina production is determined to a significant extent by morphometric and bathymetric changes in the lakes, since nutrient conditions along do not account for the Bosmina curve. Bosmina production may further be enhanced by the dystrophic process of lakes, as indicated by recent investigations in southwest Finland. (Josefson-USGS)

PREDICTION OF VERTICAL PROFILES OF WIND SPEED OVER A LAKE,
Department of Energy, Mines and Resources, Burlington (Ontario). Centre for Inland Waters.
H. S. Weiler.
Proceedings of the Twelfth Conference on Great Lakes Research, Michigan University, Ann Arbor, Michigan, p 492-503, May 5-7, 1969. 4 fig, 3 tab, 27 ref.

Descriptors: *Winds, *Wind velocity, Air temperature, Height, Water temperature, *Lakes, Forecasting, *Lake Ontario, Great Lakes.
Identifiers: Vertical wind profile, Monin-Obukhov wind profile.

A large number of vertical profiles of mean wind speed above the lake surface were collected at a site in Lake Ontario in 1967. Two schemes for predicting the vertical profile of mean wind speed over a lake from measured values of air temperature and wind speed at one height, as well as the surface water temperature, were tried. A total of 787 wind speed profiles were analyzed, and showed that there was no significant difference in the ability of either the engineering formula approach used by meteorologists over land, or the modified Monin-Obukhov log plus linear wind profile approach, to predict the vertical profile within a standard deviation of 3.6 percent at the worst. It is concluded that for general computational purposes, the simpler of the two schemes, the engineering formula approach, would be preferable. (Upadhyaya-Vanderbilt)

WATER STRESS AND APICAL DOMINANCE IN PISUM SATIVUM,
Regina Research Station (Saskatchewan).
G. I. McIntyre.
Nature New Biology, Vol 230, No 11, p 87-88, Mar 17, 1971. 2 p, 1 fig, 3 tab, 7 ref.

Descriptors: *Soil water-plant relationships, *Beans, *Transpiration, Testing, Test procedures, Plants, Plant growth, Plant physiology, Nitrogen, Carbohydrates.
Identifiers: *Water stress, *Apical dominance, Pisum sativum.

A recent study of apical dominance in isolated rhizomes of Agropyron repens L. Beauv. suggested that inhibition of the lateral buds by the rhizome apex largely depends on the supply of water, nitrogen and carbohydrate, any of which could act as a limiting factor and thus determine the degree of inhibition. To test this hypothesis, experiments were conducted with peas (Pisum sativum, variety 'Alaska'), which exhibit strong apical dominance and which are widely used in the study of this phenomenon. The results agreed with the concept of limiting nutritional factors, and suggest that for this species water stress may be particularly significant. (Woodard-USGS)

2J. Erosion and Sedimentation

EROSION RATES IN THE STEVEVILLE BADLANDS, ALBERTA,
Alberta Univ., Edmonton.
Ian A. Campbell.
Canadian Geographer, Vol 14, No 3, p 202-216, 1970. 7 fig, 7 tab, 26 ref.

Descriptors: *Soil erosion, *Sediment yield, *Precipitation (Atmospheric), *Geomorphology, Runoff, On-site data collections, Geology, Landforms, Semiarid climates, Seasonal, Particle size, Microenvironment, Slopes, Regression analysis, Correlation analysis.
Identifiers: *Alberta (Canada).

Geomorphological investigations of badlands have a number of advantages: (1) The areas are nearly totally devoid of vegetation and therefore lacking an unconsolidated but impermeable parent material which normally facilitates the quick development of erosional and depositional forms under rapid runoff conditions (2) The number of landform generating variables is minimal (3) since many formation or destruction processes are small scale, they may be observed and measured in detail. Nine 1 square yard runoff plots, encompassing a variety of microenvironmental conditions, were randomly selected in a number of relatively undisturbed rilled slopes. Each plot was supplied with a 6-inch rain gauge and 6 sediment yield collections were taken from July - October. Sample yields were weighed and wet-sieved for particle size determination. Weights were tabulated against precipitation amounts causing their production and particle size distributions were compared to lithological distributions. No relationship was found between the 2 sets of particle size distribution. There was an overall relationship between rainfall amount and sediment yield but linear regression analysis for each rainfall period showed no correlation between these amounts for any period. It was therefore necessary to individually analyze each plot's rainfall and sediment yields, and a strong correlation was then found. Annual sediment yield rates are likely to be underestimated because of drainage due to snowmelt. Moreover, downslope sediment yield occurs piecemeal. Results should be interpreted cautiously. (Casey-Arizona)
W71-07165

FATTY ACID DIAGENESIS IN RECENT SEDIMENT FROM NARRAGANSETT BAY, RHODE ISLAND,
Rhode Island Univ., Kingston. Graduate School of Oceanography.
John W. Farrington, and James G. Quinn.
Nature Physical Science, Vol 230, No 11, p 67-69, Mar 15, 1971. 3 p, 1 fig, 2 tab, 8 ref.

Descriptors: *Sedimentology, *Sediments, *Diagenesis, *Bays, *Organic acids, Core drilling, Sampling, Analytical techniques, Rhode Island, Texas.
Identifiers: *Narragansett Bay (RI), *Baffin Bay (Tex).

The total fatty acid concentrations in cores from recent sediments from Narragansett Bay, Rhode Island decreased rapidly from 0 to 8 cm to 16 to 33 cm and level off at 33 to 52 cm. This may be due to a diminution of bacterial and/or infaunal activity at the last of these depths of burial. The concentration of the unsaturated fatty acids relative to the saturated fatty acids decreases rapidly with depth. This can be attributed to any one or a combination of the following: (1) the greater stability of the saturated fatty acids relative to the unsaturated fatty acids; (2) the conversion of some of the unsaturated fatty acids to their saturated analogues; (3) preferential resynthesis of saturated fatty acids because of bacterial or infaunal activity. The fatty acid concentrations from samples collected at Narragansett Bay are compared with findings from a similar study made in Baffin Bay, Texas. (Woodard-USGS)

MARINE SHELL RADIOCARBON DATES AND THE CHRONOLOGY OF DEGLACIATION IN WESTERN SCOTLAND,
Institute of Geological Sciences, Edinburgh (Scotland).
J. D. Peacock.
Nature Physical Science, Vol 230, No 2, p 43-45, Mar 8, 1971. 3 p, 1 fig, 3 tab, 14 ref.

Descriptors: *Radioactive dating, *Clays, *Marine geology, *Carbon radioisotopes, *Sedimentation, Glaciation, Bentonite, Core drilling, Boreholes, Bottom sediments, Sampling, Pleistocene epoch.
Identifiers: *Scotland.

Richly fossiliferous marine clays of late-Glacial age have long been known from the Clyde area and from isolated localities as far north as Fort William, and radiocarbon dates have been published from such clays incorporated in terminal moraines of the Loch Lomond readvance. Dates for four additional localities determined at Stockholm on behalf of the Institute of Geological Sciences are presented. At South Shian at the seaward end of Loch Creran, the shells were obtained from glacially disturbed marine clay exposed below morainic sands near the ferry pier. The dates, which fall within the Allerod part of the Late Weichselian, compare with those from Drymen and Menteith and confirm that the glacial deposits belong to the Loch Lomond readvance. Identifiers: *Philippine Sea.

Four of the major oceanographic institutions that have strong interests in the fields of marine geology and geophysics formed the Joint Oceanographic Institutions for Deep Earth Sampling (JOIDES) in May 1964. This group included Lamont-Doherty Geological Observatory; the Institute of Marine Sciences, University of Miami; THE Scripps Institution of Oceanography, University of California at San Diego; and the Woods Hole Oceanographic Institution. The membership of this original group was later enlarged in 1968 when the University of Washington became a member. The goal of the Deep Sea Drilling Project is to gather scientific information that will help determine the age and processes of development of the ocean basins. Cores recovered from deep beneath the ocean floor provide reference material for a multitude of future studies in fields such as biostratigraphy, physical stratigraphy, and paleomagnetism, that will afford a new scope for studies of the physical and chemical aspects of sediment provenance, transportation, deposition, and diagenesis. This volume contains data collected during a cruise from Honolulu, Hawaii, to Apra, Guam, June-August, 1969. (See also W71-07288 thru W71-07291) (Woodard-USGS)

INTERSTITIAL WATER STUDIES ON SMALL CORE SAMPLES, DEEP SEA DRILLING PROJECT, LEG 6,
Geological Survey, Woods Hole, Mass.; and Woods Hole Oceanographic Institution, Mass.
F. T. Manheim, and F. L. Sayles.
For sale by Superintendent of Documents, US Government Printing Office, Wash, DC 20402 Price - $15.50 (casebound). In: Initial Reports of the Deep Sea Drilling Project, Vol 6, National Science Foundation Publication, p 811-821, February 1971: Washington, DC, US Government Printing Office. 11 p, 2 tab, 1 ref. NSF Contract C-482.

Descriptors: *Connate water, *Core drilling, *Sediments, *Water chemistry, *Pacific Ocean, Interstices, Marine geology, Porosity, Sampling, Water quality, Chemical analysis, Data collections, Analytical techniques, Water storage, Diagenesis.
Identifiers: *Interstitial water, Sediment waters, Philippine Sea.

Sediments from sites west of the Hawaiian Islands consisted primarily of variouscombinations of deep-sea biogenic oozes, volcanic ash, and its breakdown products. Pore fluids from most of the sites were similar in composition to present day ocean water, and in some sites almost identical. However, interstitial fluids from Site 53 (Philippine Sea) showed changes in ionic composition which were beyond those previously considered attributable to diagenetic influence. These samples show the beginnings of metamorphism by dramatic increases in calcium concentrations and corresponding decreases in alkali concentrations. Increases in calcium concentration to over 3000 ppm were encountered in Site 53; these contrast sharply with values of about 400 ppm for oceanic waters and common pore fluid values. The concentrations of major and minor constituents are tabulated. (See also W71-07287) (Woodard-USGS)

INTERSTITIAL WATER CHEMISTRY: DEEP SEA DRILLING PROJECT, LEG 6,
California Univ., Los Angeles. Dept. of Geology; and California Univ., Los Angeles. Inst. of Geophysics and Planetary Physics.
B. J. Presley, and I. R. Kaplan.
For sale by Superintendent of Documents, US Government Printing Office, Wash, DC 20402 Price - $15.50 (casebound). In: Initial Reports of the Deep Sea Drilling Project, Vol 6, National Science Foundation Publication, p 823-828, Feb 1971: Washington, DC, US Government Printing Office. 6 p, 2 tab, 4 ref. NSF Contract C-482.

Descriptors: *Core drilling, *Connate water, *Sediments, *Pacific Ocean, *Water chemistry, Interstices, Marine geology, Sampling, Water quality, Chemical analysis, Analytical techniques, Data collections, Porosity, Water storage.
Identifiers: *Interstitial water, Sediment waters, Philippine Sea.

The interstitial water from cores taken between Hawaii and Guam consist of 49 samples of approximately 5 milliliters each, 4 samples of approximately 100 milliliters each, and 4 samples of approximately 10 mililiters each. These pore waters were squeezed from sediment consisting primarily of biogenic oozes and volcanic ash, and were collected at 14 sites in the NW Pacific Ocean and Philippine Seas. Analysis was started as soon as the samples had arrived at UCLA, nevertheless, as much as 3 months had then elapsed after collection. The iron, cobalt and copper concentrations show less variation than values obtained previously. This could be due to the more uniform lithology of the Leg 6 sediments. Biogenic oozes yield pore waters somewhat enriched in these trace metals, when compared to terrigenous-derived sediments. Chemical analyses data re tabulated. (See also W71-07287) (Woodard-USGS)
W71-07289

GRAIN SIZE RESULTS AND COMPOSITION OF THE SAND FRACTION, LEG 6,
Scripps Institution of Oceanography, La Jolla, Calif.
A. C. Pimm.
For sale by Superintendent of Documents, US Government Printing Office, Wash, DC 20402-Price-$15.50 (casebound). In: Initial Reports of the Deep Sea Drilling Project, Vol 6, National Science Foundation Publication, p 709-737, Feb 1971: Washington, DC, US Government Printing Office. 29 p, 2 fig, 3 plate, 2 tab. NSF Contract C-482.

Descriptors: *Sedimentology, *Pacific Ocean, *Core drilling, *Sediments, *Particle size, Marine geology, Physical properties, Sampling, Methodology, Data collections, Sediment transport, Deposition (Sediments), Sands.
Identifiers: *Sand fraction.

The complete grain size results from analyses of sediment core samples from the Northwest Pacific Ocean are tabulated. The sand fraction recovered from the grain size analysis was examined under a binocular microscope. A complete summary of the composition of the sand fraction is given. In brief, the sand fraction of chalk oozes is dominated by planktonic foraminifera. Siliceous microfossils are rare in the chalk oozes and are usually only present in Upper Oligocene and younger sediment being most common in the Caroline Ridge sites. Detrital and authigenic minerals are extremely rare and probably make up less than 1% of the total sand fraction. (See also W71-07287) (Woodard-USGS)
W71-07290

SEDIMENTOLOGY SYNTHESIS: LITHOLOGY, CHEMISTRY AND PHYSICAL PROPERTIES OF SEDIMENTS IN THE NORTHWESTERN PACIFIC OCEAN,
Scripps Institution of Oceanography, La Jolla, Calif.; and California Univ., Santa Cruz.
A. C. Pimm, R. E. Garrison, and R. E. Boyce
For sale by Superintendent of Documents, US Government Printing Office, Wash, DC 20402 - Price - $15.50 (casebound). In: Initial Reports of the Deep Sea Drilling Project, Vol 6, National Science Foundation Publication, p 1131-1252, Feb 1971, Washington, DC, US Government Printing Office. 121 p, 15 fig, 38 plate, 8 tab, 24 ref. NSF Contract C-482.

Descriptors: *Sedimentology, *Pacific Ocean, *Core drilling, *Sediments, Petrography, Chemical properties, Physical properties, Marine geology, Mineralogy, Sampling, Data collections, Instrumentation, Methodology, Sediment transport, Deposition (Sediments).
Identifiers: *Philippine Sea.

Brown clay was recovered from core sediment samples at 8 sampling sites in the Northwest Pacific Ocean. Of these sites, 4 were in water depths exceeding 5000 meters with brown clay ranging in age from Recent to Upper Cretaceous. Two of these sites contain carbonates in the Middle to Lower Cretaceous. Two sites were in water depths ranging from 4300 to 4600 meters and only contain brown clay in the Upper Tertiary. One site has some interbedded marl ooze with the brown clay in the Pleistocene; the water depth there was 4282 meters and, therefore, is probably close to the calcium carbonate compensation depth. The distribution of the brown clay is closely related to water depth and on the evidence of drilling during Leg 6, occurs everywhere in the West Pacific in water deeper than about 4000 to 4200 meters and in the Philippine Sea in water deeper than 4500 meters. HOLOCENE SEDIMENTATION RATES IN OVERBANK DEPOSITS IN THE BLACK BOTTOM OF THE LOWER OHIO RIVER, SOUTHERN ILLINOIS,
Illinois Univ., Urbana. Dept. of Geography.
Charles S. Alexander, and Jean Cutler Prior.
American Journal of Science, Vol 270, No 5, p 361-372, May 1971. 12 p, 6 fig, 2 tab, 14 ref.

Descriptors: *Sedimentation, *Ohio River, *Sedimentation rates, *Radioactive dating, Sedimentary structures, Deposition (Sediments), Sediment distribution, Sediment load, Sediment yield, Carbon radioisotopes, Flood plains, Alluvium, Alluvial channels.
Identifiers: *Natural levees.

Radiocarbon dates of organic matter collected from the alluvium of the Black Bottom portion of the Ohio River flood plain indicate three rates of sedimentation in the recent past, in natural levee, swale, and ridge deposition. All rates reflect the varied environments of deposition on the flood plain and can be ordered with regard to increasing intensity as follows: ridge deposition, swale fill, and natural levee deposition. The persistence of deposition on the ridges and swales despite the more rapid levee growth requires some periodic restraint upon levee sedimentation--probably by episodes of river bank erosion. Periods of river bank erosion interspersed with river bank deposition could account for the long term dynamic stability in the river margin. The slowly increasing rate of deposition may be related to the gradual decline in the flow of excess Ohio River flood waters through the adjacent Cache Valley beginning about 8000 years ago and to vegetation disturbance by upriver cultivation during the last 1500 years. (Knapp-USGS)

OREGON AND NORTHERN CALIFORNIA COASTAL RECONNAISSANCE,
Louisiana State Univ., Baton Rouge. Coastal Studies Inst.
Richard J. Russell.
Louisiana State University Coastal Studies Institute Technical Report 86, Aug 30, 1970. 25 p, 1 map, 18 photo, 16 ref. ONR Contract N00014-69-A-0211-0003, Project NR388002.

Descriptors: *Beach erosion, *Coasts, *Marine geology, *Oregon, *California, Subsurface flow, Zone of aeration, Hydrogeology, Zone of saturation, Groundwater movement, Water table, Water level fluctuations, Bedrock, Shoals, Reefs, Shores, Oceans, Recreation, Boats, Geomorphology, Erosion.
Identifiers: *Coastal landforms, Sea cliffs, Beach rock.

Erosion of sea cliffs above and below the water table in Oregon and northern California was studied during a reconnaissance in April and May 1970. Retreat of sea cliffs in the zone of aeration above groundwater level is associated with the development of platforms of marine abrasion toward the top of the underlying zone of cementation, where rock is more durable. Pseudo-beach rock in sandy beaches consists of bedrock abraded along the zone of water table fluctuation. Some general comments on coastal landforms are included and some applications are indicated for users of small boats. (Woodard-USGS)

BED LOAD TRANSPORTATION IN ALLUVIAL CHANNELS,
Uttar Pradesh Irrigation Research Inst., Roorkee (India).
Satya P. Garg, A. K. Agrawal, and Prem Raj Singh.
ASCE Proceedings, Journal of the Hydraulics Division, Vol 97, No HY 5, Paper 8091, p 653-664, May 1971. 12 p, 4 fig, 1 tab, 18 ref, append.

Descriptors: *Bed load, *Sediment transport, *Alluvial channels, Hydraulic models, Flumes, Equations, Hydraulics, Tractive forces, Sedimentation.
Identifiers: Flume models.

A new approach for calculation of bed load considers the total energy balance of flows in mobile bed channels. The proposed equation utilizes the known hydraulic parameters and sediment characteristics along with the Shields' critical tractive force curve. Experiments were conducted in a 158 ft long and 4-ft wide flume having glass sides. The mean grain sizes for the experimental sand, as calculated by Simpson's formula, were 0.289 mm, 0.49 mm, and 0.534 mm. The sediment transport calculated from the proposed equation was compared with the measured value. The correspondence of the observed and computed bed load transport is quite satisfactory for the plotted data. (Knapp-USGS)

CHARACTERIZATION OF BOTTOM SEDIMENTS: CATION EXCHANGE CAPACITY AND EXCHANGEABLE CATION STATUS,
Rutgers-The State Univ., New Brunswick, N. J. Dept. of Soils and Crops.
Stephen J. Toth, and Arthur N. Ott.
Environmental Science and Technology, Vol 4, No 11 p 935-939, Nov 1970. 4 tab, 11 ref.

Descriptors: *Cation exchange, *Sediments, *Encroachment, *Water pollution, Soil analysis, Analytical techniques, Organic matter, Delaware River, Hudson River, Ponds, Freshwater, New Jersey, Pennsylvania, Saline water.
Identifiers: Sample preservation, Chesapeake Bay, Barnegat Bay.

Modifications were determined of soil characterization methods which would be required to characterize bottom sediments based upon samples taken from some rivers, bays, and freshwater impoundments. Two PARAMETERS WERE USED: cation exchange capacity (CEC) and exchangeable cation status (ECS). CEC is the ability of an exchanger, expressed in terms of me. per 100 g, to retain a specific cation at a certain pH value and salt concentration. ECS, expressed in like terms, refers to the amount of Na, K, Ca, Mg, and H held by the soil complex. It was determined that CEC and ECS values can be utilized in determining salt-water intrusions and pollution effects. These values need to be determined on fresh or frozen and thawed sediments since drying reduces CEC and exchangeable Fe and Mn contents. Exchangeable H ions cannot be determined in NH4OAc extracts because large amounts of dispersed organic matter and exchangeable Fe and Mn are present. There are extremely wide variations found in CEC and ECS values. The organic content of bottom sediments is responsible for about 80 percent of the CEC. (Mortland-Battelle)

DETERMINATION OF CALCIUM BY RADIOCHEMICAL REPLACEMENT,
Reading Univ. (England).
H. J. M. Bowen.
Analyst, Vol 96, No 1140, p 220-222, Mar 1971. 3 p, 2 fig, 1 tab, 11 ref.

Descriptors: *Water chemistry, *Chemical analysis, *Calcium, *Radiochemical analysis, Analytical techniques, Instrumentation.
Identifiers: *Calcium determination, Radiochemical replacement, Oxalates, Silver-110, Manganese-54, Cobalt-60.

Calcium ions in solution may be determined by radiochemical replacement of silver-110 in labeled solid silver oxalate, cobalt-60 in labeled cobalt oxalate and manganese-54 in labeled manganese oxalate. A one-to-one replacement was observed with manganese oxalate. The technique can be used to determine 25 to 100 micromole per ml (100 to 4000 micrograms per ml) of calcium, and the lower limit is reduced to 16 micrograms per ml by using a 50 percent methanol solution. Magnesium interferes to only a small extent. Each determination takes less than 5 minutes, and the precision is 2 percent. (Woodard-USGS)

PROPYLENE CARBONATE EXTRACTION OF TRIS (PENTAN-2, 4-DIONE)-IRON (III) FROM AQUEOUS SOLUTION: APPLICATION TO THE

SPECTROPHOTOMETRIC DETERMINATION OF IRON,
Wofford Coll. Spartanburg, S.C. Dept. of Chemistry.
B. G. Stephens, James C. Loftin, William C. Looney, and Kenneth A. Williams.
Analyst, Vol 96, No 1140, p 230-234, Mar 1971. 5 p, 1 fig, 3 tab, 8 ref.

Descriptors: *Water chemistry, *Chemical analysis, *Iron, *Aqueous solutions, *Spectrophotometry, Carbonates, Analytical techniques, Instrumentation.
Identifiers: *Propylene carbonate, Reagents.

Orange tris (pentan-2, 4-dione) iron (III) was extracted from aqueous solution into propylene carbonate at pH 4.0 to 9.0. Distribution coefficients ranged from 23.9 to 116, depending on the ionic strength and pH of the aqueous phase. Relative standard deviations of the spectrophotometric methods developed are 1.52 percent or less and these methods are applicable to the routine determination of 56 to 391 micrograms of iron. (Woodard-USGS)

THIAMINE LIMITED STEADY STATE GROWTH OF THE YEAST CRYPTOCOCCUS ALBIDUS,
Alaska Univ., College. Inst. of Marine Science.
D. K. Button.
University of Alaska, College, Institute of Marine Science, Mimeo, (Undated). 20 p, 4 fig, 3 tab, 15 ref. OWRR Project A-007-ALAS (3).

Descriptors: *Vitamin B, *Growth rates, *Yeasts, Microogranisms, Mathematical models, Nutrients, Temperature, Hydrogen ion concentration, Energy, Population, Oxygen, Enzymes.
Identifiers: *Thiamine, *Cryptococcus albidus, Continuous culture, Batch growth, Stirring rate.

The concentration-growth rate relationship of a thiamine-requiring microorganism was examined. Cryptococcus albidus was selected on the basis of its thiamine requirement, marine origin, and amenability to continuous culture. Although oscillations in the organism population were generated under some nutritional conditions, such as manganese deficiency, the thiamine limited steady state was smooth and constant. Thiamine free glucose was prepared by irradiating the required amount of recrystallized glucose in a small quarts tube for one hour with an ultraviolet lamp. The half life of thiamine is in the order of minutes under these conditions. Data suggest a diffusion limited mechanism characterized by an apparent Michaelis constant for growth of 0.47 picomoles. This relationship was obtained from continuous culture at steady state and checked by a non-steady state procedure and in batch growth. These checks were compatible with the value reported. It was concluded that most natural water systems have sufficient thiamine to support some thiamine-requiring microorganisms at above rate limiting concentrations. Thus where thiamine is an important factor in the ecology of heterotrophic systems it is probably in a range below current means of analytical detection. (Jones-Wisconsin)

ORIGIN OF COLORS AND IRONSTONE BANDS IN THE COLUMBIA FORMATION, MIDDLETOWN-ODESSA AREA, DELWARE,
Delaware Geological Survey, Newark.
N. Spoljaric.
Southeastern Geology, Vol 12, No 4, p 253-266, Apr 1971. 14 p, 7 fig, 2 tab, 18 ref. OWRR Project B-002-DEL (3).

Descriptors: *Delware, *Water chemistry, *Iron, *Groundwater movement, Chemical precipitation, Water levels, Water table, Leaching, Water quality, Aquifers, Sands, Sandstones, Mineralogy, Geology, Geochemistry.
Identifiers: Columbia Formation (Del).

Colors in the Columbia Formation (Pleistocene) in the study area are dependent on the amount of iron present. The source of iron found in these sediments is the underlying greensand of the Rancocas Formation (Paleocene-Eocene age). Iron seems to have been transported from its source by groundwater and precipitated in the capillary fringe zone and zone of watertable fluctuations. Ironstone bands, however, are thought to have been formed in the zone by aeration by the precipitation of iron from groundwater. In general there is no relationship between the shape and size of the ironstone bands and the textures and structures of the sediments that contain them. The shapes of the bands reflect the type of the groundwater flow at the time of formation. (Knapp-USGS)

TILLAMOOK BAY, OREGON.
Corps of Engineers, Washington, D.C. Committee on Tidal Hydraulics.

Printed by US Army Engineer Waterways Experiment Station, Vicksburg, Mississippi, Jan 1970. 15 p, 2 pl.

Descriptors: *Jetties, *Channel improvement, Estuaries.
Identifiers: *Tillamook Bay (Ore), Jetty spacing.

Committee on Tidal Hydraulics was requested to review plans for construction of south jetty, approximately 7800 ft in length, at entrance to Tillamook Bay, primarily to provide protection for navigation against southwesterly storm waves but also to reduce maintenance requirements of channel. Proposed spacing between north and south jetties, if a deep-draft channel is authorized in the future, has been questioned. Pertinent information on tidal prism, littoral drift, ecological (oyster bed) considerations, discharge and current velocities, and south jetty plans are given in this report. Conclusions of Committee are presented along with recommendations which include a revised alignment for south jetty, a surveillance program, and a small-scale fixed-bed hydraulic model to study interrelation of jetty spacing and tidal prism. Descriptors: *Esturaries, *Phytoplankton, *Distribution patterns, *North Carolina, *Computer programs, Data processing, Data collections, Variability, Probability, Water pollution effects, Algae, Aquatic habitats, Aquatic environment.
Identifiers: *Pamlico River (NC).

A computer based technique for analyzing distribution patterns among estuarine organisms was developed and tested on phytoplankton collections from Pamlico River, North Carolina. Jaccard's coefficient of similarity was used to generate a similarity matrix with final printout in dendrogram form showing clusters of collections having inherent similarity. Use of a similarity index based solely upon presence or absence of species within all possible pairs of data collections produced a dendrogram which described the seasonal periodicity of phytoplankton in the central Pamlico River. Computer programs developed in this project are written in Fortran IV and have been deposited in the program library of the East Carolina University Computer Center and can be obtained upon request from its director. SEDIMENT PATTERNS, PHYSICAL CHARACTERS OF THE WATER MASS AND FORAMINIFERIDA DISTRIBUTION IN INDIAN RIVER, BAY, COASTAL DELAWARE,
Delaware Univ., Newark. Dept. of Geology, and Oregon State Univ., Corvallis. Dept. of Oceanography.
John C. Kraft, and Gertrude Margules.
Southeastern Geology, Vol 12, No 4, p 223-252, Apr 1971. 30 p, 17 fig, 21 ref, append. NSF Grant GP-5604.

Descriptors: *Bottom sediments, *Estuaries, *Benthos, *Distribution patterns, *Delaware, Benthic fauna, Aquatic microorganisms, Sedimentation, Water quality, Saline water intrusion, Water temperature, Salinity, Water chemistry.

dentifiers: Indian River Estuary (Del).

The physiographic setting, bottom sediment facies patterns, salinity, temperature, pH, Eh, and organic content of the water mass and bottom sediments of the Indian River Estuary, Delaware, were correated with the distribution of living benthonic Foraminiferida. Twelve genera, including 23 spe-ies of Foraminiferida, were tentatively identified nd separated into six geographically defined facies roups. No significant correlation was found etween patterns of foraminiferal abundance and he distribution of sediment types. Furthermore, vith the exception of an Ammobaculites assemblage occuring in the tidal streams to the west, here is no significant association between species ccurrence and the physical parameters observed. The species of benthonic Foraminiferida found liv-ng in the Indian River estuary system appear to be olerant of highly varied bottom sediment types and hysical characteristics of the water mass. (Knapp-USGS)

ELECTRODIALYSIS FOR DESALTING HAWAIIAN BRACKISH GROUNDWATER: A FIELD STUDY,
Hawaii Univ., Honolulu. Water Resources Research Center.
.. Stephen Lau, and James C. S. Chou.

Water Resources Research Center Technical Report No 41, University of Hawaii, Honolulu, July 1970. 20 p, 4 fig, 4 tab, 24 ref.

Descriptors: *Desalinization, Hawaii, *Electrodialysis, *Brackish water, Water treatment.
Identifiers: Brackish groundwater, Groundwater pollution.

A field study was made to evaluate the applicability and problems of desalting brackish groundwater from basaltic and reef limestone aquifers in Honolulu, Hawaii with the electrodialysis process. The three-week study indicated that the brackish water at both sites was upgraded to potable quality and the rejection of ionized salts was above 80 percent. No pretreatment was necessary. Both the average production and rejection rates were about 420 gpd. An economic evaluation was not determinable from the short-term results. (Lau-Hawaii)

Descriptors: *Water management (Applied), *Water resources development, Cost-benefit analysis, Technical feasibility, Water supply, Water demand, Reservoirs, Dams, Inter-basin transfer, Artificial recharge, Ecology, Recreation.
Identifiers: *New Castle County, Delaware, Schuylkill River, Susquehanna River.

This study concludes that current water demand exceeds current safe yield in New Castle County, Delaware, that the deficit may increase by 2 to 3 million gallons per day in the near future, and that, from the economic and engineering viewpoints, the proposed White Clay Creek Dam and Reservoir has the greatest prospect of any proposed project for increasing water supply. Previous engineering, economic, and feasibility studies of the water resources and demand projections in the county are reviewed. Aspects discussed include: projected water demand and county needs, an economic analysis of the White Clay Creek Dam and Reservoir proposal, other currently feasible alternatives, groundwater development, a study of the ecological and aesthetic aspects of the reservoir site, and a projection of economic conditions and financing alternatives. Other alternatives discussed include an interbasin transfer from the Schuylkill and Susquehanna Rivers to the White Clay Creek, proposed by the Mason-Dixon Task Force, and a large-scale artificial groundwater recharge project. FINAL REPORT ON RESEARCH AND ENGINEERING DEVELOPMENT AND EVALUATION OF ICE NUCLEI DISPERSION SYSTEMS, MAY 1, 1967 TO MAY 1, 1970.
Colorado State Univ., Fort Collins. Dept. of Mechanical Engineering.

Available from National Technical Information Service, as PB-196 149, $3.00 in paper copy, $0.95 in microfiche. Colorado State University, Atmospheric Simulation Laboratory Report 1970. 61 p, 39 fig, 8 ref, append. Bur Reclam Contract No 14-06-D-6170.

Descriptors: *Cloud seeding, *Silver iodide, *Equipment, Weather modification, Condensation, Water management (Applied).
Identifiers: *Silver iodide sources, *Nuclei generators.

Design and development of ground and airborne steady-state ice nuclei generators for field application are described. Performance, reliability, ease of maintenance, simplicity, and cost improvements were necessary and were accomplished. Units were needed capable of remote operation. Design of a new prototype generator with improved performance is described; nucleating materials, carriers, and fuels are discussed; and results of extensive field tests are given. (Knapp-USGS)

GROWTH AND PERFORMANCE OF COTTON IN A DESERT ENVIRONMENT: I. MORPHOLOGICAL DEVELOPMENT OF THE CROP; II. DRY MATTER PRODUCTION; III. CROP PERFORMANCE,
Cotton Research Corp., Namulonge (Uganda). Cotton Research Station.
A. B. Hearn.
Journal of Agricultural Science, Camb, 1969, Vol 73, No 1, I. p 65-74, II. p 75-86, III. p 87-97. 19 fig, 13 tab, 65 ref.

Descriptors: *Cotton, *Plant growth, *Plant morphology, *Environmental effects, *Fiber crops, Arid lands, Deserts, Planting management, Crop production, Crop response, Plant physiology, Flood irrigation, Alluvium, Sierozem, Soil-water-plant relationships, Varieties, Spatial distribution, Irrigation water, Equations, Economic efficiency, Effects, Photosynthesis, Leaves, Carbon dioxide, Light, Soil water, Evapotranspiration, Seeds.

Identifiers: *Dry matter production, *Plant requirements, Yemen, Dry weight, Unit leaf-area index, Beer's law.

Agriculture in southern Yeman is based on annual spate floods, deep alluvial soils, and deep-rooted crops such as cotton. General principles of cotton growth were studied under a variety of experiments in 1963 and 1964. The results of variety, sowing date, irrigation water and plant spacing tests indicate that morphological change and dry weight increase are linked to predict crop performance. An exponential equation is developed for dry weight and unit leaf-area index, based on Beer's Law as opposed to linear regression. Varieties and agronomic practices are discussed in economic terms. An empirical relationship between water, dry matter production and cotton seed yield is evaluated physically and biologically based on work by Penman and deWit, and practically based on commercial yields and watering rates. Experimental procedure for I includes number of mainstem notes, variety, water, branches, fruiting points, and treatment effects. Potential photosynthesis, leaf distribution, CO sub 2 exchange resistance, light, vegetative and reproductive growth are evaluated for II. Soil water, evapotranspiration, seed cotton, plant weight and structure, water, mainstem, fruiting points, and boll and fibre character are investigated in III. (Popkin-Arizona)

IRRIGATION RESEARCH PROGRESS REPORT 1970, OKLAHOMA IRRIGATION RESEARCH STATION, ALTUS, OKLAHOMA.
Oklahoma Irrigation Experiment Station, Altus.

Oklahoma State University, Agricultural Experiment Station, Progress Report, P-639, Sept 1970. 29 p.

Descriptors: *Irrigation practices, *Fertility, *Soil-water-plant relationships, *Water conservation, *Oklahoma, Varieties, Testing, Soil management, Insect control, Weed control, Fiber crops, Crop production, Cotton, Projects, Nitrogen, Vertilicillium, Wilting, Forages, Entomology, Cultivation, Grains (Crops), Soybeans, Sorghum, Wheat.
Identifiers: *Irrigated crops, Cropping systems, Row spacing, Seedbed preparation, Thermal effects, Leaf rust.

Research of the Oklahoma Irrigation Research Station at Altus during 1970 includes irrigation problems, soil fertility, variety testing, soil management, insect and weed control, cropping systems, and food, feed and fiber crops production. The field station in southwestern Oklahoma receives 24.5 inches of rainfall annually, and has an average summer and winter temperature of 83.0 and 43.0 degrees F. Soils are Tillman and Hollister clay loams with 0 to 1 percent slopes, and pH range from 6.5 to 8.0. Lower than average rainfall, and high temperatures reduced insect problems on cotton in 1970. Twenty-one current projects are summarized, 6 of which deal with irrigated cotton in terms of test varieties, verticillium wilt, nitrogen-verticillium interaction and row spacing. One project involves testing establishment and management of forages. Other projects include weed control, entomology and cotton fertility, seedbed preparation, tillage and thermal effects, small grains and leaf rust, and soybean, grain sorghum and wheat investigations. Most results are forth coming, as experiments require more years of data. (Popkin-Arizona)

PRODUCING WATERMELONS IN KANSAS,
Kansas State Univ., Manhattan. Dept. of Horticulture and Forestry.
Charles V. Hall.
Kansas State University, Agricultural Experiment Station, Bulletin 532, Feb 1970. 16 p, 2 tab, 17 fig. Kansas Agricultural Experiment Station Contribution No 455.

Descriptors: *Crop production, *Melons, *Kansas, *Plant growth, *Irrigation practices, Vine crops, Root systems, Field capacity, Fruit crops, Sands, Plant diseases, Flowering, Crop response, Consumptive use, Soil moisture, Drought resistance, Marketing, Harvesting, Weed control, Insect control, Mulching, Planting management, Fertilization, Irrigable land, River beds, Varieties, Soil water, Soil-water-plant relationships.
Identifiers: *Growing season, *Crop requirements, Ripening, Storing, Handling, Transplanting, Site selection, Soil preparation.

Watermelons, which serve as an important water source in central and arid Africa, survive the desert climate, and absorb and store soil water. Varieties are grown in Kansas along river valleys, in sandy soils, and in irrigated semiarid areas. Growing technique and problems are discussed under site selection and soil preparation, fertilization, planting or transplanting, plastic mulches, irrigation, and control of insects, disease and weeds. Harvesting, handling, storing and marketing techniques are outlined. Irrigation is necessary in western Kansas and beneficial in eastern Kansas, though watermelons are fairly drought resistant. Soil moisture throughout the early growing season must be adequate to maintain healthy growth and yield vigorous blossoms. Healthy watermelons permit irrigation reduction during ripening. Watermelons benefit from irrigation if soil moisture content is low, when vining starts, when blossoms appear, and as fruit are growing. Water applied should bring soil moisture to field capacity 2 to 3 feet deep because of the deep-root system. (Popkin-Arizona)

THE ARIZONA LETTUCE INDUSTRY: COMPETITION, PRICES, DEMAND, SUPPLY CONTROL,
Arizona Univ., Tucson. Dept. of Agricultural Economics.
Robert S. Firch, and Daniel W. Mathews.
Arizona Agricultural Experiment Station, Technical Bulletin 188, Jan 1971. 10 p, 6 tab, 4 fig, 3 ref. Regional Research Project WM-58.

Descriptors: *Arizona, *Lettuce, *Competition, *Prices, *Demand, Water conservation, Fertilizers, Benefits, Economics, Profit, Costs, Organizations, Income, Optimization, Stabilization, Seasonal, Quality control, Harvesting, Varieties, Supply, Crop production, California, Arid lands.
Identifiers: *Supply control, Irrigated crop, Shipping costs, Harvest costs, Quantity sold, FOB Price, Grower net revenue, Salinas (Cal), Yuma (Ariz), Imperial Valley (Cal).

Lettuce, an important irrigated crop in the arid southwest, is a dynamic industry, where California and Arizona produce 80% of the total supply for the US and Canada. Arizona is too warm for commercial summer production; the Salinas area of California produces summer lettuce; Arizona's Yuma area and California's Imperial valley are the principal winter production areas. This paper, based on Mathews' masters' thesis, briefly discusses competition among western producing areas, Arizona lettuce prices and demand, and supply control and potential effects on grower net revenue. A total of 21,846 thousand cartons of lettuce were produced in Arizona in 1964-70, compared to a peak of 24,280 thousand cartons in 1961-62, and a low of 12,664 thousand cartons in 1949-50; commercial production began in Arizona in 1947-48. Lettuce prices reflect varieties changes, harvesting selectivity, and market effects of quality differences. Spring demands are stronger than winter demands. The following formula is developed to optimize and stabilize crop profits b industrial organizations. Grower Net Revenu equals (FOB Price times Quantity Sold)- (Harve and Shipping costs). (Popkin-Arizona).

THE EGYPTIAN AGRARIAN REFORM PROBLEMS AND PROSPECTS,
S. C. Schmidt.
Economic Planning, Vol 6, No 2, p 7-9, Mar-A 1970.

Descriptors: *Arid lands, *Economic impact, *I rigated land, *Land uses, Political aspects, Fert izers, Planning, Economic efficiency, Cooper tives, Economic feasibility.
Identifiers: *Egypt, *Agrarian reform, *Nile Rive

In Egypt, rainfall is negligible, and there is to reliance on the Nile River for irrigation water. On 3.5% of the land area is under cultivation, almo all of it being in the Nile valley. Because of limited physical resources, Egypt has only 2 pos ble avenues for agricultural development: (Bringing more land into production, which wou have to be desert land, and would therefore be e tremely expensive; (2) Intensification of cultivati in available land which is represented mainly by t Aswan High Dam. Until desalinization becom economically feasible, further intensification w be vertical and through improvement of irrigati by improvement of the country's weak draina system, more mechanization, and better fertili practices. Egyptian agriculture is labor-intensi and highly productive. Nevertheless, by 1963, had become a net food importer, reflecting t combined effects of higher population and u graded diets. Agriculture accounts for 27% of t GNP and industry accounts for 23%, but natio policy has been to increase the industrial sec because it is far less intensified than agricultu and should yield greater output/unit input. Unf tunately, so far the industrial sector has not sorbed much labor. Since 1952, extensive agrari reform has taken place and many of the landlords have been eliminated. Most agricultu output is still private, but the agrarian reform s ceeded, without harming production, because the government's takeover and improvements vital services-credit, marketing, cooperatives, rigation, drainage and land reclamation. (Cas Arizona).

CONSIDERATIONS FOR WATER USE AND MANAGEMENT IN THE BIG LOST RIVER BASIN, IDAHO; A SUPPLEMENTAL REPORT,
Geological Survey, Boise, Idaho. Water Resources Div.
E. G. Crosthwaite, C. A. Thomas, and K. L. Dyer.
Geological Survey Open-file Report, 1970. 15 p, 1 fig, 1 tab, 2 ref.

Descriptors: *Water management (Applied), *Irrigation water, *Conjunctive use, *Water storage, *Groundwater recharge, Water spreading, Irrigation efficiency, Reservoir design, Reservoir yield.
Identifiers: *Big Lost River Basin (Idaho).

Additional management of the surface-water resources in the Big Lost River basin, Idaho, is needed to (1) supply irrigation requirements during drought years, (2) provide increased flood control, and (3) insure more efficient use of the water supply available in normal years. Annual flow at Arco ranged from 0 to 195,500 acre-feet during the period 1944, 1947-68. Also, although an average of only about 7,000 acre-feet per year (10 cfs) passed the gage during the dry period 1960-64, the annual flow exceeded 100,000 acre-feet (138 cfs) in 5 years of the 23-year period 1944, 1947-68. An average annual flow of 55,900 acre-feet (77 cfs) left the basin during the period. Much of the water could be saved by prolonging the use of the storage space available in Mackay Reservoir, by construction of additional reservoirs, by increased diversion of upstream flows onto the Chilly-Barton Flats and thereby increasing the amount of water temporarily retained in the underlying aquifers, and by increasing irrigation efficiencies. (Knapp-USGS)

OPTIMAL POLICY FOR OPERATION OF A MULTIPURPOSE RESERVOIR,
Clemson Univ., S.C. Water Resources Research Inst.
B. J. Prochaska, and C. B. Russell.
Available from the National Technical Information Service as PB-198 520, $3.00 in paper copy, $0.95 in microfiche. Report No 18, Jan 1971. 54 p, 10 fig, 3 ref. OWRR Project A-018-SC (1).

Descriptors: *Mathematical models, *Optimization, *Dynamic programming, *Multipurpose reservoir, Reservoir management, *Reservoir operation, Operations research, Hydroelectric power, Statistical models, Economics, Inflow, Low-flow augmentation, Water level fluctuation.
Identifiers: Probabilistic dynamic programming, *Optimal control, Operating policy, Stochastic inputs, Optimal strategies, Auxilary power.

A mathematical model of a multipurpose reservoir is formulated taking into account such factors as: flow augmentation, the stochastic nature of inputs, requirements on the reservoir level, and the hydroelectric function of the reservoir. Based on the model an optimal solution to the problem of allocation of the impounded water is determined. These optimal polices or strategies are determined by (probabilistic) dynamic programming for which the objective is to minimize the expected total discounted cost over a finite horizon. These general results are in the form of theorems, some of which are represented graphically. A numerical example, to illustrate the results, and general implementation remarks are included.

WATER RESOURCES PLANNING STUDY FOR ARKANSAS AND OKLAHOMA,
Arkansas Univ., Fayetteville. Water Resources Research Center.
L. R. Heiple, and H. M. Jeffus.
Available from the National Technical Information Service as PB-198 522, $3.00 in paper copy, $0.95 in microfiche. Water Resources Research Center, Publication No 7, 1970. 149 p, 19 fig, 22 tab, 5 ref, 4 append. OWRR Project B-001-ARK (3).

Descriptors: *Flow rates, *Reservoir storage, Storage, Withdrawal, Distribution, *Planning, Arkansas, Oklahoma, *Interstate compacts.
Identifiers: Monthly fows, Flow frequency, Maximum storage, Maximum withdrawal.

The primary goal of this study was to review, analyze, and correlate previously collected hydrologic data for use by the Arkansas-Oklahoma Compact Committee in apportioning the joint water resource of the respective states. The objectives of this project included to determine stream discharge throughout the base period of study for all major watercourses flowing between the two states, a statistical review of the stream flows derived above to provide usable flow data based on various recurrence intervals, to consider conservation storage feasibility at various sites, and to review water quality, predict the effect of reservoir storage and the future use of these streams. The results included mean monthly flow data for gaging sites where major streams cross the Arkansas-Oklahoma state line, flow frequency studies of all gaging stations within the Compact area of interest, and the development of reservoir storage procedures which permit the sizing of reservoirs at a chosen stream location. WATER RELATED LAND USE IN THE WEBER RIVER DRAINAGE AREA,
Utah Dept. of Natural Resources. Div. of Water Rights.
Frank W. Haws.
Utah State University, Logan, Water Research Laboratory Report PR-WG-40-4, Feb 1970. 79 fig, 50 tab.

Descriptors: *Maps, *Land use, *Water utilization, *Land classification, Vegetation, Crops, Watersheds (Basins), Utah, Water resources development, Planning, Drainage districts.
Identifiers: *Water related land use, *State water plans, Weber River Drainage Area.

In developing a state water plan, it is essential to know the amount of water depleted from a natural drainage basin through evaporation and transpiration. In order to estimate water loss, the types and amounts of crops produced, as well as types and amounts of non-crop vegetation, must be known. Using aerial photographs projected on a base map, as well as on-the-ground surveys, 29 types of water-related land use have been plotted, and many maps showing the amount and type of water-related land use are included. Tables give the number of acres per section under each type of land use. (Yensen-Arizona)

PRELIMINARY DESIGN REPORT, URBAN STORM DRAINAGE MODEL CITIES--DENVER.
Denver Dept. of Public Works, Colo.

Wright-McLaughlin Engineers Consultants report for Waste Water Control Division, Department of Public Works, City and County of Denver, Jan 1971. 2 tab, 3 fig, 26 dwg, append.

Descriptors: *Storm drains, Design data, Urbanization.
Identifiers: *Model cities, *Urban storm drainage, Denver.

The investigation of the urban storm drainage problems, the development of the goals and objectives for the area, and the planning of suitable solutions as presented in this report have been related to the overall urban system of Model Cities and the adjacent City and County of Denver. The summary and conclusions relative to the urban storm drainage system of Model Cities study areas A, C, D, and G are as follows: (1) Poor urban storm drainage systems have significantly contributed to the depressed nature of the neighborhoods; (2) Health, security and welfare of residents can be materially improved by bettering the drainage system; (3) Potential for improving the study areas appears to be great; (4) The 1985 land use map, prepared by the City in 1966, is a reasonable projection of future land uses and urban drainage planning; (5) The future degree of imperviousness and runoff coefficients were chosen on the basis of the 1985 map; (6) Selection of the design storm frequency for design of the major drainage system ranged from 25 to 100 years; (7) Goals and objectives developed using an environmental design team; (8) No allowance was made for a future roof top ponding ordinance; (9) Numerous auxilliary benefits have been identified; (10) Existing drainage problems are tabulated in detail; (11) Recommended solutions are included; (12) The design criteria utilized is based upon the Urban Storm Drainage Criteria Manual of the Denver Regional Council of Governments; (13) A strategy for financing and implementation has been developed; (14) Legal aspects are presented in the appendix. ENVIRONMENTAL POLICY: NEW DIRECTIONS IN FEDERAL ACTION, RESTRUCTURING FOR COORDINATIVE POLICY AND ACTION,
Indiana Univ., Bloomington.
Lynton K. Caldwell.
Public Administration Review, Vol 28, No 4, p 301-303, July-Aug 1968.

Descriptors: *Environment, Decision making, Federal government, *Social aspects.
Identifiers: *Environmental policy, Federal participation, Coordinative policy, Public response.

The concept of public responsibility for the quality of the environment and for maintaining its viability has not yet become firmly embodied in the public law. Certain aspects of environmental policy have achieved statutory status through legislation on behalf of public health, conservation, or urban planning. Yet these and other measures do not cumulate to give us a basic political or constitutional doctrine that would guide social conduct as it impinges upon the environment. There is a growing body of evidence that indicates the emergence of a concept of public responsibility for the environmental welfare of the American people. Yet granting evidence of public concern, and accepting the scientific arguments of need for positive public action, the establishment of environmental administration as a major coordinative and managerial task of government will not be easily achieved. It is therefore important to the values of responsible popular government and constitutional procedures that goals and guidelines be as clearly stated as possible. Current developments in public administration that will facilitate innovation in management are: (1) team direction, (2) intellectual commitment to a total systems or ecological approach, (3) matrix concept of organization, (4) increasing interaction of private industrial and academic sectors of society with government in goal-directed public enterprises, (5) cybernetics, information service, and computer technology provide improved tools for environmental management. In the management of environment, it will be necessary to restructure the public agencies. (Wray-Chicago)

ENVIRONMENTAL MANAGEMENT: WATER AND RELATED LAND,
Water Resources Council, Washington, D.C.
Henry P. Caufield, Jr.
Public Administration Review, Vol 28, No 4, p 306-311, July-Aug 1968.

Descriptors: *Environment, Management, Resource development, Decision-making.
Identifiers: *Environmental problems, Public policy, Water resources planning.

The current concern for environmental quality requires a major intellectual and cultural revolution that would affect private and public decision making. It has called upon Congress to enact numerous specific pieces of legislation; and upon the Executive Branch, generally, to administer all ongoing programs with an eye on enhancement of environmental quality. Water and related land resources management is a major area within the total scope of the new environmental management. The Water Resources Planning Act is aimed at better organization, coordination, and support of comprehensive water and related land resources planning. The basic objective in federal formul tion of plans is to provide the best use of water an related land resources to meet all foreseeable sho and long term needs. The Planning Act created th Water Resources Council and the provision fo Federal-State River Basin Commissions. Bo groups are composed of experts in the field an representatives of the states and federal agencie involved. In hopes of promoting consensus, the A directs the presidentially appointed chairman to a as coordinator of the federal members and represent the federal government in federal sta relations on the commission. The Marine Resources and Engineering Develo ment Act, passed in June 1966, was enunciated improve scientific understanding of the oceans, accelerate their exploration, and to assert a n tional consensus that untapped marine resourc should be developed to serve mankind's broad needs and aspirations. This paper is concerned wi the relationship of the marine environment to o national interests. In the Act, the President is giv responsibility to implement the legislation: developing a comprehensive program, by establi ing long-range studies, by clarifying responsibil where missions cross agency lines, and by evalu ing the government's program annually. To adv and assist the President are the National Council Marine Resources and Engineering Developme plus a professional staff. Specific areas of conce by the Marine Science Council include (1) expa sion of international cooperation in ocean explo tion, (2) intensification of food-from-the-sea efforts, (3) fostering rational development of t coastal zone, (4) preparation for new programs port development, (5) insuring the safety of and property along the coasts, (6) increasing grant program investments, (7) fostering mar applications of new technology, (8) intensificati

work in deep ocean technology, (9) increasing
ctic and subpolar research, (10) encouragement
international regional cooperation, (11) con-
uation of mapping the continental shelf. (Wray-

**VIRONMENTAL MANAGEMENT AND THE
PARTMENT OF THE INTERIOR,**
partment of the Interior, Washington, D.C.
nley A. Cain.
blic Administration Review, Vol 28, No 4, p
0-326, July-Aug 1968.

scriptors: *Environment, *Management, Natu-
Resources, Ecology, Conservation, Federal
vernment, Decision-making.
ntifiers: *Department of the Interior, Resource
licy, Government agencies.

is paper looks at government response to en-
onmental problems, especially by the Depart-
nt of the Interior. Terms, such as environment,
tural resources, human resources, ecology, and
nservation are defined. The Department of the
erior is described as a sprawling organization
h so many statutory missions that it can do no
re than suggest programs for environmental
nagement. The National Park System and Bu-
u of Sport Fisheries and Wildlife have had tre-
ndous influence on public concern for conserva-
n and the destructive processes affecting our en-
onment. The Bureaus of Outdoor Recreation, of
mmercial Fisheries, and of Land Management
clearly and properly orientated to human
eds. The Bureau of Indian Affairs and Office of
rritories are similar in that they assist in the
nagement of land and water resources, but differ
that the human interests are principally those of
residents. The Geological Survey and Bureau of
nes are aimed at minimizing ecological
turbances while providing maximum goods and
vices to the nation. The Bonneville Power Ad-
nistration markets power from federal
droelectric projects in the Pacific northwest, and
concerned with the physical and social effects of
program. The Bureau of Reclamation does
earch to aid development and conservation of
ter resources. The Office of Water Resources
search seeks to stimulate, sponsor, and supple-
nt present programs of research and training in
field of water. The difficulty in defining goals
the Department of the Interior is determining
ich goals have priority. A promising solution for
ra-departmental conflicts is more widely based
nning sessions with members from various agen-
s. (Wray-Chicago)

**TABLISHMENT OF A DEEP-SEA TER-
NAL OFF THE TEXAS GULF COAST,**
uth Texas Regional Export Expansion Council.
y R. Brimble.
ater Spectrum, Army Corps of Engineers, p 10-
, Spring 1971.

scriptors: *Harbors, Transportation, Port
thorities.
ntifiers: *Deep-sea terminal, International
de, Superships, Texas Gulf Coast.

xas port leaders have decided to explore the
sibility of a gulf offshore terminal believing that
ch a facility would greatly benefit Texas ports, in-
stries, and consumers. Advocates for construc-
n of deep-sea terminals feel the construction is
evitable if the economic benefits for U.S. con-
mers and industries in the future are to be
thcoming. Due to their immense size, supertan-
rs dictate immediate economic benefits to ship-
rs and consumers. Areas unable to accommodate
ep draft vessels will be deprived of such service
d goods. In addition to generating a substantial
w of income and employment to deep-port areas
and out of the U.S., the intermediate and end
oducts created will compete with similar U.S.
oducts. Generally, lower initial costs due to volume transportation will give foreign products a decided advantage in world markets. Opponents of deep-sea terminals present evidence composed of historical research, financial dislocations, and lack of need. They also fear Federal control. The advocates, however, point out that there is great evidence supporting the need for deep-sea terminals off the Texas Gulf Coast. Cheap transportation of petroleum, iron ores, and bauxite is vital for international trade competition. The Texas Gulf Coast area is suggested as the most suitable for developing these terminals. THE CASE AGAINST FEDERAL DEVELOPMENT OF REGIONAL PORTS,
American Association of Port Authorities.
Alfred Hammon.
Water Spectrum, Army Corps of Engineers, p 7-9, Spring 1971.

Descriptors: *Harbors, Port authorities.
Identifiers: *Ports and harbors, Superships, Federal and local involvement, American Association of Port Authorities, National Capability Study.

The public port industry through the American Association of Port Authorities (AAPA) in September 1970, completed a report titled the 'National Channel Capability Study.' The goal of the study was to understand the trend toward such superships and to survey the interests and plans of U.S. public port agencies to accommodate them in the next 30 years. Individual port responses and regional or coastal assessments within as well as outside of the AAPA study effort indicate that 40 out of 50 ports considered Federal regional port development unnecessary, undesirable and thus unwanted. The public port agencies in the U.S. are traditionally state, county, or municipal, and they pride themselves in avoiding Federal aid and securing private investment. They suspect that a Federal port scheme could seriously disrupt local port investment. Also, smaller ports see no future involvement in the supership problem, and thus have more to lose than to gain from expanded Federal port activity. Indeed, all ports have a major fear that commencement of Federal regional port development studies will bring about the termination of specifically authorized channel improvement study, construction, and maintenance projects urgently needed to fill more immediate or shorter term requirements. The need for, interest in and support for Federal approaches to regional port development by the public port industry thus is narrowed to those very few instances in which supership size pressures are such that can only be met through improvements to existing channels at a clearly unreasonable cost. The National Channel Capability Study has established that the supership problem is essentially confined to bulk cargoes and relatively few ports. (Wray-Chicago)

FLOATING VEGETATION OF LAKE KAINJI, NIGERIA,
Ife Univ. (Nigeria). Dept. of Biological Sciences.
A. M. A. Imevbore.
Nature, Vol 230, No 5296, p 599-600, Apr 30, 1971. 2 p, 11 ref.

Descriptors: *Aquatic drift, *Lakes, *Floating, *Vegetation, *Aquatic weeds, Weed control, Plants.
Identifiers: *Lake Kainji (Nigeria), *Africa, Pistia stratiotes.

Fears that Lake Kainji in Nigeria would become infested with the water weed Pistia stratiotes have not been borne out by recent events. This manmade lake now seems to be free of weed, in contrast to similar lakes elsewhere. Pistia and other potential weed could not form extensive mats at Kainji for two main reasons. First 70% of lake surface was cleared of vegetation and burnt before impoundment, which not only reduced the initial nutrient enrichment of the water but also retarded the growth of plants which would otherwise have been rapid within the quiet and stagnant water between trees standing in the lake. Frequent and regular winds also tended to destroy any mats which had formed. The most important reason is the hydrology of the lake. The ratio of outflow to volume of the lake is 4.1. Its mean retention time (capacity/inflow) has been calculated as 76 days. This means that the whole lake water is changed about four times per year. (Woodard-USGS)

DYNAMIC PROGRAMMING FOR CONJUNCTIVE WATER USE,
Pennsylvania State Univ., University Park. Dept. of Civil Engineering; and California Univ., Davis. Dept. of Water Science and Civil Engineering.
Gert Aron, and Verne H. Scott.
ASCE Proceedings, Journal of the Hydraulics Division, Vol 97, No HY 5, Paper 8145, p 705-721, May 1971. 17 p, 8 fig, 2 tab, 10 ref, append.

Descriptors: *Dynamic programming, *Conjunctive use, *Optimization, Systems analysis, Water resources development, Recharge, Reservoirs, Aquifers, Planning.

Dynamic programming may be used to optimize the conservation and use of a conjunctive system of ground and surface waters involving several surface reservoirs, streams, recharge facilities, distribution pipelines, and aquifers. This complex system should be divided into several smaller and simpler subsystems. Wherever the interdependence of the subsystems is relatively small, the operations are optimized independently. The result is a system of a small number of state and decision variables with predetermined internal operative rules, which is then subjected to a conjunctive optimization. The method is applied to a water-allocation system to produce an optimal policy for 8 yr of operation in 3-month intervals. (Knapp-USGS)

INTERPRETATION OF GEOPHYSICAL LOG IN BORES IN UNCONSOLIDATED SEDIMENTS, PHASE I,
Australian Water Resources Council, Sydney.
D. W. Emerson, and S. S. Webster.
Australian Water Resources Council, Research Project 68/7, Feb 1970 (Preliminary Edition). 211 p. Research Project 68/7, Phase I.

Descriptors: *Logging (Recording), *Water wells, Electrical logging, Radioactive logging, Groundwater, Hydrogeology, Borehole geophysics.
Identifiers: *Australia, *Groundwater investigations, Unconsolidated sediments, Practical quantitative analysis procedure, Calibration practices log interpretation procedures, Digital data acquisition.

This report covers the first phase of a two-phase project to investigate the interpretation of geophysical logs of water wells in unconsolidated sediments. Phase I of the project was designed to (1) appraise the well logging practices presently in use for groundwater investigation in Australia, (2) evaluate the geophysical well logging method in its application to unconsolidated sediments, (3) interpret selected well logs to estimate the possibility of this research project producing a practical quantitative analysis procedure. The investigation (1) above showed that the well logging practices are inadequate for a full evaluation of aquifers. A chapter concerning the standarization of gamma-ray logging is included. Present data presentation formats and radiation intensity units are shown to have little uniformity throughout Australia, while calibration practices are inadequate for the provision of accurate logs. Procedures to eliminate these deficiencies are outlined. A digital approach to data acquisition, storage and interpretation is discussed together with the description of an inexpensive, but efficient, magnetic tape recording system. Aquifer water salinity-resistivity relationships are analysed as are other aquifer parameters important to well log interpretations. The interpretation techniques employed in this report, though efficient, are provisional and should be expanded and improved during phase II of the research project. (Campbell-NWWA)

QUANTITATIVE WATER RESOURCE BASIN PLANNING: AN ANALYSIS OF THE PECOS RIVER BASIN, NEW MEXICO,
New Mexico Univ., Albuquerque. Dept. of Economics.
Ralph C. d'Arge.
WRRI Report No 8, Water Resources Research Institue, New Mexico State University, Las Cruces, 1970. 104 p, 6 fig, 69 tab, 43 ref, 10 append. OWRR Projects B-006-N MEX (2) and B-001-N MEX (2).

Descriptors: *Water allocation (Policy), *Water analysis, *Project planning, *Groundwater, *Linear programming, Water transfer, Constraints, Water users, New Mexico.
Identifiers: *Pecos River Basin.

An attempt to identify explicit policy choices for time-related reallocation of water resources within the Pecos River Basin in New Mexico was made. It was viewed as a 'closed water system' where a substantial amount of the basin's resources could be exhausted through runoff, evaporation, evapotranspiration, and groundwater mining. The report contained two major parts including a set of water requirements projections for major industrial, agricultural, and commercial water-using sectors in the Pecos Basin Five County Area (PBFCA) for the years 1980 and 2000, and an analysis of potential for intra-basin water transfers within the Pecos River Basin drainage area in New Mexico. Requirements projections developed in the first section were utilized as data inputs for the water transfer model developed in the second section. This model was of the linear programming type, containing an explicit objective function and a set of contraints on water-related activities. The initial planning objective was to reallocate existing stock and flow water sources between competitive users so as to maximize value added (gross output) of the Pecos Basin. Preliminary tests were made and results were given. Appendices gave specifics of the requirements projections. (Kriss-Cornell)

URBAN HYDROLOGY, HOUSTON METROPOLITAN AREA, TEXAS - 1968,
Geological Survey, Houston, Tex.
S. L. Johnson.
Geological Survey Data Report, 1970. 302 p, 14 fig, 14 tab, 6 ref.

Descriptors: *Streamflow, *Rainfall-runoff relationships, *Hydrologic data, *Urbanization, *Texas, Stream gages, Storm runoff, Peak discharge, Low flow, Average flow, Hydrographs, Mass curves, Cities, Data collections.
Identifiers: *Urban hydrology, Houston (Tex).

The Houston study area, centered about 45 miles from the Gulf of Mexico, is within a 1,000-square-mile area of land surface that increases in altitude from 35 feet above mean sea level in the southeast to 135 feet in the northwest. Records presented for the water year 1968 (October 1967-September 1968) include daily discharges at 33 continuous streamflow stations, annual maximum discharge at crest-stage partial-record stations, and daily rainfall from recording and nonrecording rain gages located at continuous streamflow stations and miscellaneous sites. Also included are individual storm analyses which show a mass curve for rainfall over a basin and mass curve and hydrograph of discharge from the basin, for those basins which are instrumented for more detailed study of rainfall and its relation to runoff. Average rainfall over the Houston metropolitan area during the 1968 water year was 51 inches, or 5 inches greater than the 30-year (1931-60) average for the Houston airport station. Two area-wide storms and one localized storm of unusual magnitude occurred during the year. (Woodard-USGS)

escriptors: *Great Lakes, *Land use, *Planning, Conservation, Zoning, Taxes, Government, Flood lain, Scarcity, Cost-benefit analysis, Agriculture, ptimization, Investment.
dentifiers: *Urbanization, *Industrialization, ommercial-industrial development.

onflicts are presented that exist between shore roperty users along the ten thousand miles of horeline within the Great Lakes Basin. The mul-plicity of users, each with its own peculiar equirements, is cited as the underlying cause for ch conflict. Specific conflicts dealt with include ose between urbanization and open land use, etween agricultural and industrial use, and etween commercial-industrial development and ecreational needs. One problem directly con-ected to land use planning is the haphazard evelopment which has been allowed in the flood ain. The rapid development of the shoreline area cited as the cause of various economic difficulties hich resulted in the need for increasing amounts tax monies for resolution or alleviation of the dif-culties. Improved land use planning and zoning is roposed to maintain a semblance of order for the o-existence of each interest and the maximum ood of all interests, before the loss of the remain-g open land around the Lakes can occur. PESTICIDES IN HATCHERY TROUT--DIFFERENCES BETWEEN SPECIES AND RESIDUE LEVELS OCCURRING IN COMMERCIAL FISH FOOD,
Pennsylvania State Univ., University Park. Pesticide Research Labs.
H. Cole, A. Bradford, D. Barry, P. Baumgarner, and D. E. H. Frear.
Pesticides Monitoring Journal, Vol 1, No 2, p 35-37, 1967. 2 tab, 4 ref.

Descriptors: *Pesticide residues, *Chlorinated hydrocarbon pesticides, DDT, Dieldrin, Heptachlor, Fish diets, Fish management, Brook trout, Brown trout, Rainbow trout, Gas chromatography, Analytical techniques.
Identifiers: *Fish foods, DDD, DDE, Heptachlor epoxide.

Samples of commercial fish food from four manufacturers and trout of three species, brook, brown and rainbow, were analyzed for persistent chlorinated pesticides. The trout were in the 8 to 9 inch size range at the time of analysis. Small quantities of heptachlor, heptachlor epoxide, dieldrin, DDE, DDT (TDE), o,p'-DDT, and p,p'-DDT were found in the fish food. One source contained all of the pesticides except DDD. The trout were analyzed on the basis of chloroform-methanol extractable lipids from the whole fish. The rainbow trout with one exception contained all seven pesticides. The rainbow trout contained greater quantities of all pesticides than the brook or brown trout. The brown trout contained significantly more heptachlor, heptachlor epoxide, dieldrin, DDE and DDD than the brook trout. (Sjolseth-Washington)

MERCURY DETERMINATION IN FISH SAMPLES BY WET DIGESTION AND FLAMELESS ATOMIC ABSORPTION SPECTROPHOTOMETRY,
Fisheries Research Board of Canada, Winnipeg (Manitoba). Freshwater Inst.
J. F. Uthe, F. A. J. Armstrong, and M. P. Stainton.
Journal of the Fisheries Research Board of Canada, Vol 27, No 4, p 805-811, 1970. 6 fig, 5 ref.

Descriptors: *Spectrophotometry, *Test procedures, Analytical techniques, Heavy metals, Laboratory tests, Laboratory equipment.
Identifiers: *Mercury, Wet digestion, Tissue analyses.

A simple, rapid method is given for determination in fish of mercury at concentrations measured in parts per million (ppm). Samples are digested at 50-60 C with sulphuric acid and oxidized with permanganate. Mercury in the digest is determined by atomic absorption spectrophotometry. Recovery of mercury added to samples was complete, with good precision. Standard deviations from triplicate analyses were plus or minus 0.039 at the 0.1 ppm level and plus or minus 0.051 at the 0.5 ppm level. In a day, three workers analyzed 15-20 samples in triplicate. (Sjolseth-Washington)
W71-07148

IDENTIFICATION OF PETROLEUM PRODUCTS IN WATER,
Department of Energy, Mines and Resources, Ottawa (Ontario). Inland Waters Branch.
Adrian Demayo.
Canada Dept of Energy, Mines and Resources, Inland Waters Branch Technical Bulletin No 32, 1970. 22 p, 14 fig, 14 ref.

Descriptors: *Pollutant identification, *Oily water, *Laboratory tests, *Gas chromatography, Test procedures, Oil gasoline, Water pollution, Analytical techniques, Instrumentation.
Identifiers: *Oil spills.

This report describes an extraction method used to analyze water samples, and activated carbon samples through which water has been passed, for the presence of crude oil or other petroleum products. The chromatogram of a mixture of a series of hydrocarbons which was used to check the performance of the gas chromatographic system at various times is presented. The performance of the method was constant over the period of time during which this work was carried out. The chromatogram of a diesel oil and that of a gasoline are very different in their patterns. The range of carbon number is also different; in gasoline it ranges from C6 to C11 while in a diesel oil the range is from C10 to C18. (Woodard-USGS)
W71-07240

THE USE OF ULTRA-VIOLET ABSORPTION MEASUREMENTS FOR THE ESTIMATION OF ORGANIC POLLUTION IN INSHORE SEA WATERS,
University Coll. of North Wales, Menai Bridge. Marine Science Labs.
P. Foster, and A. W. Morris.
Water Research, Vol 5, No 1, p 19-27, Jan 1971. 9 p, 7 fig, 7 ref.

Descriptors: *Pollutant identification, *Organic matter, *Sea water, *Spectrophotometry, Ultraviolet radiation, Analytical techniques, Spectroscopy.
Identifiers: *Ultraviolet absorption spectroscopy.

Changes in the ultraviolet absorption spectra of sea water at an inshore station were monitored. These changes were interpreted in terms of variable supply of organic matter from the major sources of land drainage and autochthonous biological activity. Differences in the molecular nature of the organic matter derived from these sources result in seasonal variations in both the degree of absorption per unit of dissolved organic carbon and the relative absorption within different wavelength regions. Hence, only a poor correlation was obtained between the ultraviolet absorption and the dissolved organic carbon content. Appreciable short term variations in spectra were also recorded. These variations severely limit the use of ultraviolet absorbance measurements for the indication of marine organic pollution. (Knapp-USGS)
W71-07256

AN IMPROVED DIANTHRIMIDE TECHNIQUE FOR THE DETERMINATION OF BORON IN RIVER WATERS,
Calgary Univ. (Alberta). Dept. of Geology.
A. A. Levinson.
Water Research, Vol 5, No 1, p 41-42, Jan 1971. 2 p, 6 ref. Canada National Research Council Grant A4383.

Descriptors: *Pollutant identification, *Boron, *Surface waters, *Analytical techniques,

*Colorimetry, Water analysis, Salinity, Water chemistry.
Identifiers: *Boron determination.

A modified dianthrimide method is described which is capable of detecting as little as 0.01 mg per liter boron in river water. The procedure is based upon the use of calcium hydroxide to fix the boron; this also permits rapid evaporation of the water sample without the loss of volatile borates. (Knapp-USGS)
W71-07257

IMPROVED CHEMICAL OXYGEN DEMAND APPARATUS,
Montgomery Research, Inc., Pasadena, Calif.
R. J. TeKippe, and R. G. Zehnpfennig.
Journal Water Pollution Control Federation, Vol 43, No 3, Part 1, p 515-518, Mar 1971. 4 p, 2 fig, 1 ref.

Descriptors: *Water analysis, *Oxygen demand, *Chemical oxygen demand, *Chemical analysis, Equipment, Instrumentation, Dissolved oxygen.
Identifiers: *Chemical oxygen demand tests.

The conventional chemical oxygen demand test method, although becoming more popular than the 5-day biochemical oxygen demand test, still suffers from inconveniences inherent in the use of water-cooled condensers. Air-cooled condensers perform equally well, and with suitable timers can be operated automatically. The unit described has been in operation for over 6 yr and has proven satisfactory in every respect. (Knapp-USGS)
W71-07259

AVERAGE DISSOLVED OXYGEN--MEASUREMENT AND WATER QUALITY SIGNIFICANCE,
Geological Survey, Menlo, Calif.
Keith V. Slack.
Journal Water Pollution Control Federation, Vol 43, No 3, Part 1, p 433-446, Mar 1971. 14 p, 5 fig, 3 tab, 41 ref.

Descriptors: *Dissolved oxygen, *Water analysis, Reviews, Analytical techniques, Water quality, Diurnal, Monitoring, Surveys, Diffusion, Osmosis.
Identifiers: *Dissolved oxygen measurement.

Available methods of obtaining dissolved oxygen (DO) data at water quality network stations have limitations of high cost, inconvenience of sampling for diel changes, or inadequacy of data for comparative purposes. The diel average DO concentration is better than a single daytime measurement for comparing DO conditions at different stations. Simple devices called DO integrators were developed for determining average DO concentration. The integrators are closed containers filled with water that contacts the environment through semipermeable diffusion barriers. Molecular oxygen diffuses through the barriers until oxygen pressures inside and outside the containers are equal. Diurnal and other short-period fluctuations in DO are smoothed out, and thus the integrator DO concentration is the average DO of the environment. Average DO concentrations, combined with measurements of instantaneous DO in late afternoon, provide a basis for estimating the nighttime extreme DO concentration. (Knapp-USGS)
W71-07260

DETERMINATION OF METHYLMERCURY SALTS IN VARIOUS KINDS OF BIOLOGICAL MATERIALS,
National Inst. of Public Health, Stockholm (Sweden).
Gunnel Westoo.
Acta Chemica Scandinavica, Vol 22, No 7, p 2277-2280, 1968. 5 ref.

Descriptors: *Heavy metals, Metals, Fish, *Analytical techniques, *Chemical analysis, Physicochemical properties, Water pollution, Bottom sediments, Benthic fauna, Benthos, Laboratory tests, Waste identification, *Pollutant identification.
Identifiers: Mercury, *Mercury pollution.

The cysteine acetate modification of the method for determining methylmercury salts in foods, which was useful for analysis of fish, egg white, and meat, was not efficient when applied to egg yolk with low methylmercury content, liver, sediments in aquaria, or sludge. Therefore some modifications of the procedure have been investigated. A combination of the mercuric chloride and cysteine acetate procedures gave good results for sediments in aquaria and sludge and could also be used for, e.g., fish, egg white, bile, kidney, blood, meat, and moss. Precipitation of the proteins with molybdic acid at the first extraction improved the results for liver but not for egg yolk. For egg yolk an increase of the concentration of the cysteine acetate solution from 1 to 10% gave 90% recovery of added methyl mercury, repeated extractions 100% recovery. (Novotny-Vanderbilt)

DETERMINATION OF METHYLMERCURY COMPOUNDS IN FOODSTUFFS, II. DETERMINATION OF METHYLMERCURY IN FISH, EGG, MEAT, AND LIVER,
National Inst. of Public Health, Stockholm (Sweden).
Gunnel Westoo.
Acta Chemica Scandinavica, Vol 21, No 7, p 1790-1800, 1967. 2 fig, 4 tab, 8 ref.

Descriptors: *Heavy metals, *Analytical techniques, Fish, Biochemistry, Organic compounds, Gas chromatography, Chemical analysis, Carbohydrates, Water pollution, Pollutant identification.
Identifiers: Mercury, *Mercury pollution, *Methylmercury.

The combined gas chromatographic and thin-layer chromatographic method for the identification and determination of methylmercury compounds in fish has been modified in order to render it applicable to a wider range of foods. In animal foodstuffs methylmercury is probably to a great extent attached to thiol groups. When these foods are extracted methylmercury chloride is formed and dissolves in the benzene together with varying amounts of thio compounds. Purification of the methylmercury in the benzene extracts of, e.g., egg yolk or liver by extraction with aqueous alkali solution did not work, probably because the thio compounds were not volatile and could form alkali-insoluble methylmercury salts. Evidently methylmercury-S-compounds were reformed at high pH and prevented the formation of the water-soluble methylmercury hydroxide. Addition of excess mercuric ions, which expelled the methylmercury from the thio compounds solved this clean-up problem. Samples of fish, egg-white, egg yolk, meat, and liver have been analyzed with the modified method. Extraction of the methylmercury into an aqueous phase was also possible with the aid of a water solution of cysteine. This led to a more rapid analytical procedure. (Novotny-Vanderbilt)

MERCURY ANALYSIS IN BIOLOGICAL MATERIAL BY DIRECT COMBUSTION IN OXYGEN AND PHOTOMETRIC DETERMINATION OF THE MERCURY VAPOUR,
Statens Provningsanstalt, Stockholm (Sweden).
V. Lidums, and U. Ulfvarson.
Acta Chemica Scandinavica, Vol 22, No 7, 1968, p 2150-2156.

Descriptors: *Heavy metals, *Analytical techniques, Metals, Biochemistry, Chemical analysis, Physicochemical properties, Laboratory tests, Waste identification, Biomass, Photometry, *Pollutant identification.
Identifiers: Mercury, *Mercury pollution.

Mercury in small quantities in, for example, biol
ic material is determined by direct combustion
oxygen of samples weighing between 20 and 2
mg. The combustion gases are passed through c
ferent zones under temperature conditions ca
fully controlled to allow complete oxidation of
ganic material, but also to avoid the formation
mercury oxide. The mercury is temporarily c
lected on a gold filter. When all combusti
products have passed through the system the m
cury absorbed on the gold is released by heati
and the mercury vapour is determined photome
cally by means of ultraviolet light absorption
253.7 nm. The reproducibility of the method
good; the difference between duplicate analyse
mostly less than 10%. Samples containing abou
ng of mercury per g may be analysed without d
ficulties. (Novotny-Vanderbilt)

YEASTS ISOLATED FROM THE SOUTH SASKATCHEWAN, A POLLUTED RIVER,
National Research Council of Canada, Saskatoon, (Saskatchewan). Prairie Regional Lab.
J. F. T. Spencer, P. A. J. Gorin, and N. R. Gardner.
Canadian Journal of Microbiology, Vol 16, p 1051-1057, 1970. 3 fig, 4 tab, 18 ref.

Descriptors: *Yeasts, *Sewage effluents, Rivers, Sampling, Domestic wastes, Cultures, Isolation, Bionindicators.
Identifiers: *Proton magnetic resonance, Saskatchewan River (Canada) Canada.

Minimum numbers of yeasts isolated from the Saskatchewan River in the summers of 1964 and 1965 ranged from 400 to 500 cells/liter upstream from the city of Saskatoon, to 4600 cells/liter immediately downstream. In the summer of 1968, a period of extremely low water, the counts were 150 cells/liter upstream from the city and 30,000 cells/liter downstream. Proton magnetic resonance spectra of the mannose-containing polysaccharides from representative cultures of the different species isolated were used as an aid in classification. Most of the species were asporogenous, and included representatives of the genera Candida, Trichosporon, Rhodotorula, Torulopsis, and Crytococous. Some species of Pichia, Saccharomyces, and Debaryomyces were isloated. The yeasts were mostly introduced into the river with the effluent from the Saskatoon sewage system. (McCann-Battelle)

INDIRECT SPECTROPHOTOMETRIC DETERMINATION OF CHLORIDE BY SOLVENT EXTRACTION AS TRIS (1,10-PHENANTHROLINE) IRON (II) THIOCYANATE,
Hiroshima Univ., (Japan). Dept. of Chemistry.
Y. Yamamoto, T. Kumamaru, A. Tatehata, and N. Yamada.
Analytica Chimica Acta, Vol 50, No 3 p 433-438, June 1970. 2 fig, 2 tab, 7 ref.

Descriptors: *Spectrophotometry, *Chloride, *Colorimetry, *Separation techniques, Fresh water, Sulfates, Phosphate, Fluoride, Carbonate, Potassium, Sodium, Sulphide, Analytical techniques.
Identifiers: *Chemical interference, Acetate, Ammonium ions, Bromide, Iodide, Cyanide, Thiocyanate, Turbidimetry, Mercury ions.

An indirect spectrophotometric method for the determination of small amounts of chloride in fresh waters is described. Chloride ions react with mercury (II) thiocyanate to liberate thiocyanate ions, which can be selectively extracted into nitrobenzene with tris (1,10-phenanthroline) iron (II) chelate cations. The red color (516 nm) of the organic phase measured against a reagent blank is proportional to the initial concentration of chloride ions in the aqueous phase. Beer's law is obeyed over the concentration range of from 0 to the minus 5th power to 5.6 to the minus 5th power M of chloride. The color stability and the apparent sensitivity are better than those of the mercury (II) thiocyanate-iron (III) method. Large amounts of sulphate, phosphate, fluoride, carbonate, acetate, potassium, and ammonium ions had negligible or no effect; bromide, iodide, cyanide, sulphide, and thiocyanate interfered. (McCann-Battelle)

ATOMIC ABSORPTION AND FLUORESCENCE SPECTROSCOPY WITH A CARBON-FILAMENT ATOM RESERVOIR. PART III. A STUDY OF THE DETERMINATION OF CADMIUM BY ATOMIC FLUORESCENCE SPECTROSCOPY WITH AN UNENCLOSED ATOM RESERVOIR,
Imperial Coll. of Science and Technology, London (England). Dept. of Chemistry.
J. F. Alder, and T. S. West.
Analytica Chimica Acta, Vol 51, No 3, p 365-372, Sept 1970. 5 fig, 3 tab, 5 ref.

Descriptors: *Spectroscopy, *Fluorescence, Argon, Nitrogen, Instrumentation, Heavy metals, Analytical techniques.
Identifiers: *Cadmium, Atomic fluoresence spectroscopy, Atomic absorption spectroscopy, Chemical interference.

A modified filament atom reservoir cell is described which permits atomic fluorescence measurements to be made without surrounding the electrically heated graphite element with a glass dome. The fluorescence behavior of cadmium in this atom reservoir is given. At 228.8 nm, cadmium exhibits resonance fluorescence more strongly in argon than in nitrogen, but at 326.1 nm cadmium exhibits much strnger 'stepwise fluorescence' in nitrogen than in argon. Nitrous oxide, carbon dioxide, and hydrogen atmospheres show very strong quenching action at 228.8 nm and no luminescence is shown at 326.1 nm. Various interference effects and their elimination are discussed. The detection limits for cadmium are 1.5 to the minus 13th power g (0.00015 p.p.m.) at 228.8 nm in argon and 3 to the minus 13th power g (0.0003 p.p.m.) in nitrogen. (McCann-Battelle)

THE TITRIMETRIC DETERMINATION OF MERCURY (II) WITH THIOACETAMIDE,
Eastman Kodak Co., Rochester, N. Y. Research Labs.
Barbara Coulter, and David G. Bush.
Analytica Chimica Acta, Vol 51, No 3 p 431-436, Sept 1970. 2 fig, 1 tab, 9 ref.

Descriptors: *Volumetric analysis, *Halides, Ions, Organic compounds, Heavy metals.
Identifiers: *Mercury, *Thioacetamide, Schoniger combustion, (Ethylenedinitrilo)-tetraacetic acid (EDTA), Chemical interference.

A rapid method is described for the direct titration of mercury (II) in the presence of halide ions, which cause interference in classical titrations. The mercury (II), in an alkaline solution as the (ethylenedinitrilo) tetraacetic acid (EDTA) complex, is titrated potentiometrically with thioacetamide and a silver sulfide-calomel electrode pair. Organomercury compounds which are not soluble in alkaline EDTA may be titrated after Schoniger combustion. The relative error of the method is 1 percent. (McCann-Battelle)
W71-07393

THE DETERMINATION OF LEAD BY ATOMIC FLUORESCENCE SPECTROSCOPY,
Imperial Coll. of Science and Technology, London (England). Dept. of Chemistry.
R. F. Browner, R. M. Dagnall, and T. S. West.
Analytica Chimica Acta, Vol 50, No 3, p 375-381, June 1970. 1 fig, 3 tab, 13 ref.

Descriptors: *Spectroscopy, *Fluorescence, Aluminum, Argon, Heavy metals, Flame photometry, Analytical techniques.
Identifiers: *Lead, Atomic fluorescence spectroscopy, Signal-noise ratios, Optical system,

Chemical interference, Atomic absorption spectroscopy.

The atomic fluorescence characteristics of lead are described in air-acetylene, nitrous oxide-hydrogen, and argon-oxygen-hydrogen flames. An electrodeless discharge tube is used as the source of excitation. A detection limit of 0.01 microgram/ml of lead in aqueous solution is obtained by measurement of the direct-line fluorescence at 405.8 nm in the argon-oxygen-hydrogen flame. The effect of 100-fold excesses of 30 cations and anions is examined: only aluminum interfered significantly. Effects of multipass optics and signal collection mirrors are examined and their effect on signal-noise ratios is discussed. The study confirmed that lead can be determined more sensitively by atomic fluorescence than by atomic absorption or flame photometry. (McCann-Battelle)

SINGLE COLUMN GAS LIQUID CHROMATOGRAPHY OF METHYL PARATHION AND METABOLITES USING TEMPERATURE PROGRAMMING,
California Univ., Riverside. Dept. of Entomology.
P. S. Jaglan, and F. A. Gunther.
Bulletin of Environmental Contamination and Toxicology, Vol 5, No 2, p 111-114, Mar/Apr 1970. 2 fig, 6 ref.

Descriptors: *Gas chromatography, *Pesticide residues, *Separation techniques, *Organophosphorus compounds, Water analysis.
Identifiers: *Metabolites, *Methyl parathion, programmed temperature gas chromatography.

Programmed temperature gas chromatography (ptgc) can rapidly separate mixtures of compounds with extremely wide boiling ranges and produce sharp symmetrical peaks that are amenable to qualitative and quantitative interpretation. Using an isothermal operation, dialkyl acid metabolite of methyl parathion could be separated and resolved only with special procedures. However, when six of these compounds were analyzed with ptgc, only methyl paraoxon and desmethylemethyl paraoxon were not resolved. These compounds are not separated because the latter is converted into the former due to column esterification. In evaluating the practicability of the method, it was found that relatively few samples per day could be analyzed with meaningful results because of the time needed for temperature equilibration and the need for duplicate injections to validate results. Other studies have shown that column life may be shortened, and some compounds, such as azinphosmethyl and coumaphos, are decomposed or altered. Quantitative variations as large as 10-20 percent were observed, which could be an important limitation. Nonetheless, the value of ptcg in the qualitative separation of compounds of wide volatilities is evident. (Mortland-Battelle)

COMPARISON OF SEVERAL LIQUID PHASES IN GAS LIQUID CHROMATOGRAPHY OF METHYL PARATHION AND METABOLITES,
California Univ., Riverside. Dept. of Entomology.
P. S. Jaglan, and F. A. Gunther.
Bulletin of Environmental Contamination and Toxicology, Vol 5, No 2, p 98-103, Mar/Apr 1970. 1 tab, 6 ref.

Descriptors: *Gas chromatography, *Separation techniques, *Organophosphorus compounds, Metabolism, Laboratory equipment.
Identifiers: *Metabolites, *Methyl parathion.

A program is reported to determine organophosphorus compounds by gas liquid chromatography (glc). In this phase of the effort, a comparison is made of the different liquid phases (from 1 to 20 percent coatings) in their ability to separate methyl parathion from its metabolites. Under isothermal conditions, the separation of methyl paraoxon, desmethyl methyl parathion, desmethyl methyl paraoxon, dimethyl phosphorothioic acid, and dimethyl phosphoric acid was not ideal on a single column because the dialkyl compounds eluted very rapidly, while other compounds eluted slowly as rounded or flattened peaks. A glc system is required in which the quantitative separation of low percentage components can be reproducibly accomplished. This can be achieved at low temperatures, but late eluting peaks become broad and unamenable to quantitation. The polar phases were found to be primarily useful for qualitative purposes and the Apiezon L column was found most promising for quantitative purposes. (Mortland-Battelle)
W71-07396

SOURCES OF COMPOUNDS INTERFERING WITH THE ANALYSIS OF EXTRACTS FOR DIELDRIN AND DDT BY GLC,
Massachusetts Univ., East Wareham. Cranberry Experiment Station.
Karl H. Deubert.
Bulletin of Environmental Contamination and Toxicology, Vol 5, No 4, p 379-382, July/Aug 1970. 1 tab, 9 ref.

Descriptors: *Water pollution sources, *Insecticides, *Rubber, *Oil, *Runoff, Gas chromatography, Chemical waste, DDT, Dieldrin, Water analysis, Soil analysis, Lubricants, Gasoline, Analytical techniques.
Identifiers: *Polychlorinated biphenyls, Tar, Chemical interference.

Analysis of soil and water by gas liquid chromatography (GLC) is complicated by unidentified peaks in chromatograms. It has been found that polychlorinated biphenyls (PCB's) may be responsible for such peaks in chromatograms of extracts of birds and fishes, and the same may be true for soil and waters. In this study, possible sources of such compounds other than fallout from the chemical industry were considered. Gas chromatography was used to analyze a variety of samples: tire rubber, road tar, synthetic fabric, rubber base board, several lubricants, kerosene, and gasoline. The analyses indicated that there are a variety of sources of compounds that may interfere with quantitation of common chlorinated hydrocarbon insecticides by GLC. Suggested environmental sources of these compounds are: rubber tires or engine oil, road surfaces, and runoff water. (Mortland-Battelle)
W71-07397

EFFECTS OF VARIOUS METALS ON BEHAVIOR OF CONDITIONED GOLDFISH,
California Univ., San Francisco.
Patricia A. Weir, and Charles H. Hine.
Archives Environmental Health, Vol 20, p 45-51, Jan 1970. 4 fig, 4 tab, 14 ref.

Descriptors: *Water pollution effects, *Toxicity, *Fish behavior, *Bioindicators, Sodium arsenate, Psychology, Wastes, Heavy metals, Standards, Water quality.
Identifiers: *Mercury ions, *Selenium ions, *Lead ions, *Sodium ions, *Goldfish, Mercury chloride, Lead nitrate, Selenium dioxide.

The deleterious effects on goldfish of four metal ions at several sublethal concentrations were measured by a conditional avoidance technique. The metals evaluated were chosen since their effect on the central nervous system is known and they are found in aquatic environments as natural and industrial contaminants. The compounds used were: sodium arsenate, lead nitrate, mercuric chloride, and selenium dioxide. The metals were tested in decreasing doses, beginning at 50 percent of their lethal concentrations, until no effects were observed. All of the metals tested impaired performance at concentrations below their lethal level. Mercury was the most potent, producing measurable effects at 0.003 p.p.m. As a result of this study, behavioral toxicity techniques are suggested as useful in setting water quality standards. (Mortland-Battelle)

INFRARED DETERMINATION OF INORGANIC NITRATES BY THE PELLET TECHNIQUE; INFRARED DETERMINATION OF TWO INORGANIC NITRATES IN THE PRESENCE OF EACH OTHER,
Frankford Arsenal, Philadelphia, Pa.
David E. Chasan, and George Norwitz.
Applied Spectroscopy, Vol 24, No 2, p 283-287, 1970. 2 fig, 4 tab, 4 ref.

Descriptors: *Analytical techniques, *Spectrophotometry, *Nitrates, *Inorganic compounds, Potassium compounds, Sodium compounds, Pollutant identification.
Identifiers: *Infrared spectrophotometry, Pellet techniques, Sodium nitrate, Potassium nitrate, Barium nitrate, Strontium nitrate.

The quantitative spectrophotometric determination of inorganic nitrates (sodium, potassium, barium, and strontium) by the pellet technique was investigated. In these methods, the nitrate was weighed into a small tared mortar, 300 mg of potassium bromide was added, the pellet was formed and absorbances were determined at the appropriate peak. The peaks recommended for sodium, potassium, barium, and strontium nitrates are 836, 825, 730, and 737 (1/cm), respectively. Methods are also proposed for the determination of two nitrates in the presence of each other. For the analysis of a mixture of sodium nitrate and potassium nitrate, measurements were made for sodium nitrate at 836 (1/cm) and for potassium nitrate at 825 (1/cm). For the analysis of a mixture of barium nitrate and strontium nitrate, measurements were made for barium nitrate at 730 (1/cm) and for strontium nitrate at 737 (1/cm). The methods for the determination of two nitrates can be used down to a ratio of 1 to 20. For lesser ratios the errors were rather large. Sulfate did not interfere with any of the procedures. These methods could probably be applied to other combinations of nitrates. (Mortland-Battelle)
W71-07399

A KINETIC METHOD FOR THE DETERMINATION OF FLUORIDE IN THE PARTS-PER-BILLION RANGE,
Freiburg Univ., Freiburg Br., German Federal Republic, Chemical Laboratory.
Dieter Klockow, Heiner Ludwig, and Miguel A. Giraudo.
Analytical Chemistry, Vol 42, No 14, p 1682-1686, Dec 1970. 2 fig, 1 tab.

Descriptors: *Analytical techniques, *Fluoride, *Volumetric analysis, Catalysts, Aqueous solutions, Electrodes.
Identifiers: *Kinetic method, Chemical interference.

Small quantities of fluoride in aqueous solutions can be determined by an indirect kinetic method in which zirconium, acting as a catalyst in the reaction between perborate and iodide, is inhibited by fluoride. In this method, different reaction rates corresponding to the amounts of fluoride present are monitored as follows: perborate is present in excess and iodide is added to the mixture by an automatic titrator to the same extent as the reaction proceeds. The rate of addition of the iodide standard solution is a measure for the reaction rate and consequently, for the concentration of the catalyst (zirconium) or the inhibiting agent (fluoride), respectively. The addition of iodide is controlled by measuring the potential of the iodide/iodine couple. The method has a working range of 19 ng to 190 ng F- per 50 ml or 0.38 to 3.8 p.p.b. The influence of 20 cations and anions on the determination was examined. Several of these caused serious interference, which suggests that they could be determined by the prescribed method. escriptors: *Spectroscopy, *Oil wastes, Oil, luoresence, Weathering, Sampling, Analytical chniques.
entifiers: *Fluoresence spectroscopy, *Oil spill, olatiles, Crude oil, Sunlight, Residual oil.

is method for measuring fluorescence emission ensities of an oil is a rapid and precise method r the comparative identification of crude and mi-refined oils. With samples from an actual oil ill, it was demonstrated that the results of this orescence method were in agreement with those four other oil identification methods. Low-boil- volatiles found in crude oils showed no orescing properties in crudes tested, and no alytical problems resulted when volatiles were noved by evaporation before analysis. It should emphasized that immediate sampling of an oil ill is very important because prolonged exposure sunlight can affect fluorescence properties of the . Also, enough samples should be taken to tablish variabilities of parameters within an oil ck. For a comparative identification, it is virlly impossible to tell if oil 'A' is the same as or ferent from oil 'B' unless a sufficient number of plicate samples of both is obtained. This method ght be applicable to other types of oils with use other fluorescence excitation and emission max- a. (McCann-Battelle)

ONTINUOUS MONITORING OF AROMATIC OMPOUNDS IN WATER BY DIFFERENTIAL IOTOMETRY,
i Pont de Nemours (E. I.) and Co., Wilmington, el.
obert S. Saltzman.
Analysis Instrumentation, Vol 6, p 79-85, 1969. 6 fig, 4 ref.

Descriptors: *Industrial wastes, *Phenols, *Photometry, Monitoring, Instrumentation, Hydrogen ion concentration, Automation.
Identifiers: *Ultraviolet absorption, Benzene, Toluene, Xylene, Pyridine.

Monitoring of plant effluents for the presence of aromatic compounds is complicated by the presence of these compounds in the incoming water. However, by continuously monitoring the UV absorption of the influent and effluent, the difference in absorption at the two points provides a measure of the plant contribution to water pollution. The systems in use at E. I. Du Pont in Wilmington, Delaware employ either dual-beam or split-beam analyzers. Where high sensitivity is required, the system incorporates an automatic zero adjustment. For monitoring monocyclic aromatic hydrocarbons, the 254 nm line from a mercury lamp is used as the UV source. However, where polycyclic aromatic, phenol, or pyridine are present, erroneously high analyses may result. But even with this limitation, the concentration of components in the effluent may be constant so that the monitor can be calibrated to measure total concentration. Specific monitoring of low concentrations of phenols can be accomplished by measuring the characteristic wavelength shift of phenol with pH. This method consists of measuring the difference in UV absorption of a sample made highly basic and then made slightly acid. Since only phenol shows this basochromatic shift, the method is highly selective. Schematics of the monitoring systems are shown. (Little-Battelle)

Descriptors: *Chromatography, *Oil, *Separation techniques, Resins, Analytical techniques.
Identifiers: Thin layer chromatography, Heavy oil.

Thin-layer chromatography has been applied to the hydrocarbon-type separation of heavy oils, with emphasis on separation of petroleum resins. A three-stage discontinuous layer-gradient plate was employed and found to give better separation of hydrocarbon types than a single absorbent plant. Various solvent combinations were utilized and placed in an eluotropic series as applied to petroleum resin separation. Semiquantitative information was obtained from a completed chromatogram plate by measuring the size of the bands or spots with a ruler or photoelectric scanner. (Little-Battelle)

A NEW RAPID METHOD FOR THE PRODUCTION OF PERMANENT STAINED SLIDES OF MARINE PLANKTON,
Connecticut Coll., New London. Marine Science Program.
Peter A. Lindquist, and Robert De Santo.
Journal of Microscopy, Vol 92, Part 2, p 153-154, Oct 1970. 1 fig, 2 ref.

Descriptors: *Phytoplankton, *Zooplankton, *Analytical techniques, Marking techniques, Membranes, Filters.
Identifiers: Sample preservation.

Preparation time for stained slides of marine plankton has been reduced by filtering plankton samples through a Millipore Hydrosol Stainless filter head adapted to accept a 13 mm, 1.2 micron white filter which is then partially dried and transferred to a blotter floated on a bath of xyene. After the filter becomes transparent, as a result of the xylene, it is transferred to a slide where Turtox stain-mountant is applied. The mountant stains zooplankton whereas the phytoplankton generally remain unstained but identifiable. Total preparation time for the slides is about 15 minutes. (Little-Battelle)

AUTOMATED COUNTING OF MICROBIAL COLONIES,
Minnesota Univ., Minneapolis. Dept. of Chemical Engineering; and Minnesota Univ., Minneapolis. Dept. of Microbiology.
D. J. Schoon, J. F. Drake, A. G. Fredrickson, and H. M. Tsuchiya.
Applied Microbiology, Vol 20, No 5, p 815-820, Nov 1970. 8 fig, 4 tab, 4 ref.

Descriptors: *E. coli, *Automation, *Instrumentation, Lactobacillus, Azotobacter, Electronic equipment, Cultures.
Identifiers: *Counting, *Capillary tube scanner, Coulter counter, Bacillus subtilis, Basillus licheniformis.

The time required for direct counting of colonies on agar plates for estimating population density of viable microorganisms has precluded studies requiring measurement of such a parameter. Bowman, Blume, and Vurek have described a photoelectrical capillary tube scanner which automates the counting. Results obtained with an instrument similar to that of Bowman et al. have been intensively analyzed with respect to precision and accuracy. The sources of 'errors' have been ascertained, and the instrument's potentialities and limitations are discussed. Counts of almost 200,000 capiliary tube readings were made during the course of this study. (McCann-Battelle)

FURTHER STUDIES ON THE DIFFERENTIATION OF CLOSTRIDIUM SORDELLII FROM CLOSTRIDIUM BIFERMENTANS BY GAS CHROMATOGRAPHY,
National Communicable Disease Center, Atlanta, Ga.
John B. Brooks, V. R. Dowell, D. C. Farshy, and A. Y. Armfield.
Canadian Journal of Microbiology, Vol 16, p 1071-1078, 1970. 3 fig, 3 tab, 13 ref.

Descriptors: *Clostridium, *Cultures, *Gas chromatography, *Pollutant identification, Carbohydrates, Biochemistry.

Identifiers: Clostridium bifermentans, Clostridium sordellii, Gas-liquid chromatography, Urease, Amines, Chloroform.

Amines produced by 31 strains of the Clostridium bifermentans and C. sordelli groups were compared by examining trifluoroaceticanhydride derivatives of basic-chloroform extracts from spent cultural medium by gas-liquid chromatography (g.l.c.) All of the urease-positive strains (16) exhibited an amine profile consistent with that of C. sordellii. On the other hand, 12 of 15 urease-negative strains produced amine g.l.c. patterns like that of C. bifermentans, and three strains produced amine patterns identical with that of C. sordellii. The carbohydrate composition of some of the strains was determined by g.l.c. of trimethylsilyl derivatives of acid-digested formamide extracts of whole cells. Two of the three urease-negative strains with amine profiles like C. sordellii had a carbohydrate composition similar to that of C. sordelli, and the other strain had a carbohydrate profile more like that of C. bifermentans. One known strain of C. bifermentans had a carbohydrate profile with characteristics of both C. bifermentans and C. sordellii. The results of this study point out the variability of urease production by C. sordellii and the value of gas chromatography in differentiating this organism from C. bifermentans. (Mortland-Battelle)

HETEROTROPHIC NUTRITION OF THE MARINE PENNATE DIATOM, CYLINDROTHECA FUSIFORMIS,
Washington Univ., Seattle. Dept. of Oceanography.
Joyce Lewin, and Johan A. Hellebust.
Canadian Journal of Microbiology, Vol 16, p 1123-1129, 1970. 2 fig, 4 tab, 8 ref.

Descriptors: *Diatoms, *Nutrient requirements, *Organic compounds, Littoral, Yeasts, Radioactivity techniques, Pigments, Trophic level, New Jersey, North Carolina, Georgia, Louisiana, Texas, Aquatic microbiology, Cultures.
Identifiers: *Cylindrotheca fusiformis, *Heterotrophic nutrition, Chromatosphore structure.

The capability of Cylindrotheca fusiformis, a marine littoral pennate diatom, for growth by heterotrophic nutrition in darkness was investigated. Lactate, fumarate, melate, Tryptone, Casamino acids, and yeast extract served as organic substrates. Glucose was not successfully used as a substrate. The generation time under optimum conditions in the dark was around 30 hours, compared to 12.5 hours at 2000 lux for cells growing autotrophically in the light. The pigment composition of dark grown cells was similar to that of light-grown cultures, except that diadinoxanthin was not detected in the dark-grown cells. Chromatophore structure in dark-grown cells was normal. Cells brought into the light after three weeks in the dark evolved oxygen immediately upon illumination. Cells did not multiphy under anacrobic conditions in the dark but could survive under these conditions for at least two months. Experiments with radioactively labeled organic compounds confirmed the growth experiments. It is not known if Cylindrotheca fusiformis in its natural habitat has the opportunity to make use of the capability for helerotrophic growth. However, five other strains isolated from widely scattered locations demonstrated the same ability. (Mortland-Battelle)
W71-07415

CHARACTERIZATION OF CLOSTRIDIA BY GAS CHROMATOGRAPHY: DIFFERENTIATION OF SPECIES BY TRIMETHYLSILYL DERIVATIVES OF WHOLE-CELL HYDROLYSATES,
National Communicable Disease Center, Atlanta, Ga. Bacteriology Section.
David C. Farshy, and C. W. Moss.
Applied Microbiology, Vol 20, No 1, p 78-84, July 1970. 1 fig, 6 tab, 21 ref.

Descriptors: *Clostridium, *Gas chromatography, *Cultures, *Pollutant identification, Hydrolysis, Biochemistry, Systematics.
Identifiers: Gas-liquid chromatography, Trimethylsilyl.

Trimethylsilyl (TMS) derivatives prepared from whole-cell hydrolysates of 36 strains, representing 10 species of Clostridium were examined by gas-liquid chromatography (GLC). The TMS profile of each species contained a group of peaks which chacterized the species. Variation among strains within a species was much lower than variation between species. Some of the closely related clostridia could be differentiated by comparing their TMS profiles. Strains of Clostridium botulinum were distinguished from C. sporogenes on the basis of the ratio of two GLC peaks which corresponded to arabinose and glucose. A peak with a retention time identical to that of mannose was present in all C. bifermentans strains but was absent in those of C. sordellii. GLC is a useful technique for characterizing microorganisms. It is best used to compare only a few species at a time and is particularly valuable where differentiation of species by conventional biochemical tests is difficult. (Mortland-Battelle)

RETENTION OF MERCURY BY SALMON,
Bureau of Sport Fisheries and Wildlife, Seattle, Wash. Western Fish Disease Lab.
Donald F. Amend.
Progressive Fish-Culturist, Vol 32, No 4, p 192-194, Oct 1970. 1 tab, 4 ref.

Descriptors: *Retention, *Salmon, Sampling, *Pollutant identification, Standards, Fish, *Sockeye salmon.
Identifiers: *Mercury, Muscle tissue, Kidney.

Juvenile sockeye salmon treated repeatedly with mercurials accumulated and retained high levels of mercury in their tissues for several months, but after four years at sea they contained normal levels of mercury in all tissues examined. Adult chinook and coho salmon also treated with mercurials as juveniles did not show abnormal levels of mercury. However, adult salmon exposed to mercury upon returning from the sea, or mercurial-treated juvenile fish, may contain abnormal levels of mercury. The dithizone photometric method (Association of Official Agricultural Chemists, 1965) was used to determine mercury content in fish. (Upadhyaya-Vanderbilt)

TRACE METAL CHARACTERIZATION IN AQUATIC ENVIRONMENTS BY ANODIC STRIPPING VOLTAMMETRY,
Bureau of Commercial Fisheries, Ann Arbor, Mich.
H. E. Allen, W. R. Matson, and K. H. Mancy.
Journal Water Pollution Control Federation, Vol 42, No 4, p 573-581, Apr 1970. 5 fig, 2 tab, 13 ref.

Descriptors: *Heavy metals, *Trace elements, Aquatic environment, *Electrolysis, Chemical analysis, Water pollution sources, *Pollutant identification.
Identifiers: Anoding stripping voltammetry, Electrodesposition.

Anodic stripping voltammetry may be used for quantitative determination of traces of metals in natural water. Less than 0.1 mg/l Pb..2 can be measured in natural waters without preconcentration of the sample. Metals from the sample are electrodeposited on composite mercury-graphite electrodes. Quantitative determination of the deposited metals is made by anodic stripping using a chronoamperometric technique. With short desposition times the kinetics of complexation of metals with naturally occurring complexing agents may be studied. The rates of exchange of complexed metals after the addition of acid or other metal cations also may be determined. (Oleszkiewicz-Vanderbilt)

MORE ON MERCURY,
Michigan Univ., Ann Arbor. Phoenix Memori
Lab.
John D. Jones.
Journal American Water Works Association, V
62, No 8, p 526, Aug 1971.

Descriptors: *Analytical techniques, *Neutron a
tivation analysis, *Potable water, Water quali
Heavy metals, *Pollutant identification.
Identifiers: *Mercury.

The author indicates the fact that the previo
statement of the Bureau of Water Hygiene, US PH
on the problem of mercury in water supplies (Jou
nal American Water Works Association, Vol 6
No 5, p 285, 1970) completely ignores one of th
most sensitive and precise methods of analys
known-the neutron activation analysis. The omi
sion is particularly surprising in view of the fact th
much of the analytical work being performed
Canada, where the problem of mercury contamin
tion was first identified, has been done by th
method. The author quotes Bernt Sjostrand th
the sensitivity limit for biological material is le
than 0.5 parts per billion, which is well below th
possible with other available methods. In additio
chemical processing is usually greatly simplifie
eliminating the possibility of erroneous results d
to losses. (Oleszkiewicz-Vanderbilt)

Health Service Drinking Water Standards Comm
tee.

The Bureau of Water Hygiene of the United Stat
Public Health Service has tentatively proposed
standard of 0.005 ppm for mercury in the drinki
water. The rationale for such a low rejection lim
stems from the danger to human health from eith
the acute or chronic ingestion of inorganic and o
ganic mercurials. The limit of 0.005 ppm is co
sidered to contain a reasonable 'safety factor' f
the protection of human health in consideration
degree of exposure, routes of entry, metabolic ra
and exertion rate of the heavy metal. The newl
formed Public Health Service Drinking Wat
Standards Committee is expected to review the te
tative standard for mercury as well as any ne
scientific information which may influence t
quantity of mercury allowed in potable water, a
to make specific recommendation for the mercu
standard. A brief review of analytical methods
given with an indication that the best availab
method for the determination of mercury is t
dithizone method. Practical sensitivity of th
technique is reported to be within the limits
0.001 to 0.01 ppm. (Oleszkiewicz-Vanderbilt)

MANURE PRODUCTION BY BROILERS,
Maine Univ., Orono. Dept. of Animal Science.
R. W. Gerry.
Poultry Science, Vol 47, p 339-340, 1968. 2 tab, 4 ref.

Descriptors: *Farm wastes, *Poultry, Feeds, Moisture content, Calcium, Phosphorus, Proteins.
Identifiers: *Manure production, Poultry litter, Broilers, Dry droppings, Wood shavings, Crude protein.

A test was conducted in which White Mountain x White Rock cross broiler were reared to 53 days of age and fed a modified New England College Conference starting ration. Actual production of dry matter which did not include the bedding or the moisture in the litter was 867 kilograms per 1000 males, 658 kilograms per 1000 females, and 748 kilograms per 1000 mixed sexes. The average amount of manure (litter) removed at the end of the test period was 1602 kilograms per 1000 birds. This litter included an average of about 500 kilograms of wood shavings per 1000 birds and analyzed 23 percent moisture. During the test period there was a marked increase in crude protein, calcium and phosphorus content of the litter. (White-Iowa State)

PROBLEMS IN THE DETERMINATION OF SODIUM NITRILOTRIACETATE IN SEWAGE AND EFFLUENT LIQUORS,
Unilever Ltd. (England). Port Sunlight Lab.
G. F. Longman.
Proceedings of the Society for Analytical Chemistry, Vol 8, No 3, p 46, Mar 1971. 1 p.

Descriptors: *Detergents, *Water pollution sources, *Waste water (Pollution), *Sewage, *Nitrogen compounds, Analytical techniques, Heavy metals, Ion exchange, Sodium hydrogen, Pollutant identification.
Identifiers: *Sodium nitrilotriacetate, * (NTA).

The biodegradability of sodium nitrilotriacetate (NTA) in sewage and effluent liquors is studied. Four techniques for determination of NTA were examined. These were coupled with one or more steps aimed at removal of interferences. They were (a) complexometric titration with copper at pH 2.5; (b) formation of copper - NTA complex and determination of this copper with oxine; (c) potentiometric titration with copper by using a copper-ion sensitive electrode; and (d) reaction with the zinc - zincon complex. All four procedures failed to give satisfactory results and the pre-treatments when applied to our systems failed to deal adequately with removal of metals from their NTA chelates. (Woodard-USGS)

A COMPREHENSIVE SAMPLING SYSTEMS FOR STUDYING THE RELATION BETWEEN VISIBILITY, METEOROLOGICAL PARAMETERS AND ATMOSPHERIC POLLUTION,
Atomic Energy Research Establishment, Harwell (England).
A. E. J. Eggleton.
Proceedings of the Society for Analytical Chemistry, Vol 8, No 3, p 44-45, Mar 1971. 2 p.

Descriptors: *Air pollution, *Fog, *Smoke, *Path of pollutants, *Analytical techniques, Sampling, Atmosphere, Environmental sanitation, Ammonium compounds, Instrumentation, Meteorology, Hydrology.
Identifiers: *Environmental pollution, Ammonium sulfate, Visibility.

The northeast coast of England is subject to sea fog, especially in spring and early summer. The situation on Teesside complicated by the presence of pollutants emitted by heavy and chemical industry in the area. A new sensor for visibility measurement (nephelometer) was developed, which measures the amount of light scattered by the atmospheric aerosol when it is illuminated by light from a flash tube. Measurement of temperature, wet-bulb depression, wind speed, wind direction, rainfall and solar radiation were also made by using standard meteorological sensors. When the observations are classified by relative humidity, there is very strong correlation between the reciprocal of the visibility and the ammonium ion concentration, the slope of the regression line being dependent on the relative humidity. Calculation of the theoretical effect of an ammonium sulphate aerosol, based upon the measured particle size distribution, shows about 80 percent of the observed extinction coefficient in the atmosphere can be accounted for. Ammonium sulfate was found widely in the atmosphere. (Woodard-USGS)
W71-07608

SIMULTANEOUS DETERMINATION OF ARSENATE AND PHOSPHATE IN NATURAL WATERS,
Rhode Island Univ., Kingston. Graduate School of Oceanography.
David L. Johnson.
Environmental Science and Technology, Vol 5, No 5, p 411-414, May 1971. 4 p, 3 fig, 3 tab, 16 ref.
ONR Contract N00014-68-A-0215-0003.

Descriptors: *Chemical analysis, *Water analysis, *Spectrophotometry, *Phosphates, *Arsenic compounds, Analytical techniques, Colorimetry, Instrumentation.
Identifiers: *Arsenates.

Arsenate can be measured in natural waters by a slight modification of normal phosphate methods. Since arsenate, like phosphate, forms a blue complex with molybdate while arsenite does not, the reduction of arsenate to arsenite eliminates its absorbance contribution in phosphate measurements. Thus, under appropriate conditions, the difference in absorbance between a reduced and an unreduced sample can be taken as a measure of the arsenate present. The method requires only one additional reagent. When absorbances are less than 0.3 and analyses are performed at least in triplicate, the method is sensitive to about 0.01 micromole of arsenate per liter; but when the absorbance of the sample is greater than 0.3, the inability to read the spectrophotometer precisely limits the sensitivity to 0.02 to 0.03 micromole per liter. Thus, the method may be used to measure the arsenate concentration in open-ocean water, but with poor precision. It is very convenient for water which has more arsenate than seawater, and in which the ratio of arsenate to phosphate is not too low. (Knapp-USGS)
W71-07617

POTENTIAL APPLICATION OF AN INFRARED SPECTRORADIOMETER FOR REMOTE DETECTION AND IDENTIFICATION OF OIL SLICKS ON WATER,
Gulf General Atomic Co., San Diego, Calif.
James S. Mattson, Harry B. Mark, Jr., Arnold Prostak, and Clarence E. Schutt.
Environmental Science and Technology, Vol 5, No 5, p 415-420, May 1971. 6 p, 10 fig, 1 tab, 3 ref.
FWQA Grant No 16020 ELH.

Descriptors: *Remote sensing, *Pollutant identification, *Oily water, *Spectroscopy, Water pollution control, Monitoring.
Identifiers: *Oil spill detection, *Oil spills, Spectroradiometers.

The possibility of a monitoring spectroradiometer for detection and identification of floating oil slicks is demonstrated by simulation experiments on floating organic films. The spectroradiometer has a circular variable interference filter as a monochromator and a small computer for instrument control and preliminary data reduction. For these experiments, a modulated source was used, and the floating organic films used were styrene and oleic acid, compounds which exhibit distinctive spectra in the 8.5 to 12.5 micron range. Characteristic dispersion spectra of these films were obtained successfully, and an actual oil monitoring system can probably be developed. (Knapp-USGS)

NOTE ON REMOVAL OF SULFUR INTERFERENCES FROM SEDIMENT EXTRACTS FOR PESTICIDE ANALYSIS,
Geological Survey, Menlo Park, Calif. Water Resources Div.
D. F. Goerlitz, and L. M. Law.
Bulletin of Environmental Contamination and Toxicology, Vol 6, No 1, p 9-10, 1971. 2 p, 7 ref.

Descriptors: *Sulfur compounds, *Pesticides, *Insecticides, *Bottom sediments, Gas chromatography, Aldrin, Dieldrin, Heptachlor, DDT.
Identifiers: Lindane, Malathion, Methyl parathion, Parathion.

Extracts of bottom muds from lakes, streams, and estuaries are quite often very difficult to analyze for pesticides because of interfering co-extractives. Analysis of the interfering co-extractives by flame-photometric gas chromatography has revealed the presence of a number of sulfur containing compounds. Shaking of a small drop of metallic mercury with the concentrated extract apparently removes sulfur and sulfur-organic compounds by precipitation. Elemental sulfur is removed very rapidly, within 1 or 2 minutes whereas other sulfur compounds react more slowly with the metallic mercury. Preliminary findings indicate that aldrin, dieldrin, heptachlor, lindane, and p,p'-DDT are not affected by the addition or mercury to hexane solutions of the insecticides, even after 5 days in contact with the metal. Malathion, methyl parathion and parathion do react with mercury and removal of these compounds is noticeable after about 10 minutes. Recovery studies are now underway on bottom muds from various locations. (Josefson-USGS)

PERIODIC REPORT OF THE WATER QUALITY SURVEILLANCE NETWORK, 1965 THRU 1967 WATER YEARS.
New York State Dept. of Environmental Conservation, Albany.

New York State Department of Environmental Conservation Report, 1970. 390 p, 25 map, 5 append.

Descriptors: *Water quality, *New York, *Data collections, *Sampling, *Monitoring, Water analysis, Water chemistry, Chemical analysis, Solutes, Coliforms, Biochemical oxygen demand, Networks, Dissolved oxygen, Nutrients.
Identifiers: New York Water quality network.

The New York State Water Quality Surveillance Network for the period 1965-1967 consisted of 153 active surface water stations established within 17 principal drainage basins. These sampling stations were selected in an attempt to represent the varying qualities of the waters in each drainage basin. Chemical, bacteriological and physical parameters were routinely measured at the water quality surveillance sampling stations. A basic frequency of one (1) sample per month was arbitrarily established for each sampling point. A major phase of the water quality surveillance program is the storage and retrieval of all water quality data. Availability and use of electronic data processing equipment has been a primary factor in establishing a comprehensive water quality data library. Computer print-out listings of raw or summarized water quality data can be requested. (Knapp-USGS)

PESTICIDES IN SOIL,
Wisconsin Univ., Madison. Water Resources Center.
B. E. Frazier, G. Chesters, and G. B. Lee.
Pesticides Monitoring Journal, Vol 4, No 2, p 67-70, Sept 1970. 4 p, 3 fig, 2 tab, 5 ref. OWRR Project B-016-WIS (9).

Descriptors: *Gas chromatography, *Soil contamination, *Pesticide residues, Heptachlor, Aldrin.
Identifiers: Soil samples, Wisconsin, Indigenous soil components, Organochlorine insecticides.

A total of 34 soil samples taken in Wisconsin between 1909 and 1911 were extracted for organochlorine insecticides and analyzed by gas chromatography on 3 columns--a mixed QF-1/IV-17 column; a mixed QF-1/DC-200 column; and a diethylene glycol succinate column. The samples had been stored continuously since collection in tightly sealed glass jars and presumably were free of insecticide contamination. Of the 34 samples 32 showed some 'apparent' insecticide residues on at least one of the columns. Because peaks corresponding to particular organochlorine insecticides on chromatograms from one column did not recur on other columns, it was concluded that the peaks arose from co-extracted indigenous soil components. Peaks corresponding to haptachlor epoxide on the QF-1/OV-17 column and to aldrin on the QF-1/DC-200 column provided greatest interference in chromatographic determination. (Frazier-Wisc)

REMOVAL OF COLOR FROM THE WATER OF WAIKOLOA STREAM SOUTH KOHALA DISTRICT, ISLAND OF HAWAII,
Hawaii Univ., Honolulu. Water Resources Research Center.
Nathan C. Burbank, Jr., Po Lau Chan, and
Reginald H. F. Young.
Technical Report No 38, Mar 1970. 21 p, 10 fig, 1 tab, 5 ref.

Descriptors: *Water analysis, *Color, *Coagulation, *Zeta-potential.
Identifiers: *Organic color, *Color colloids, *Refractive color removal, Cationic polymer.

The waters of the streams in the South Kohala District on the island of Hawaii have long been noted for their extreme high color and at times a distinct peaty taste. Early attempts to treat this water have led to the conclusion that the color bodies occurring in the water were refractive in nature and very difficult to remove except by an uneconomic chemical treatment. Investigation, over a one-year period, has found the colored bodies in the water of the Waikoloa Stream to be predominantly organic in origin with the color colloid having a negative charge. The color of the water varies from a maximum value of 320 units to a minimum value of 22 units. The average value is about 80 units. The zeta potential of the color colloid has varied from neg tive 36 mv to negative 18.5 mv. It was possible remove color to the U. S. Public Health Servi standards for interstate carriers by coagulating t color bodies with either alum or ferric sulfa Coagulant aids can significantly reduce the quan ty of the coagulant required to effect co removal. Coagulant aids decrease the required tention time in the flocculation basin and effect faster rate of sedimentation. Further, color remo is generally improved. The most satisfactory coa lant aid is a cationic polymer, which not only a as an aid but also as a true coagulant in co removal. Reductions by as much as 20 percent the amount of primary coagulant required is po ble while obtaining the same results. The optim pH range is 6 to 7 and the optimum dosage of tionic polymer is from 1 to 3 mg/l in conjunct with 15 to 20 mg/l of coagulant. (Burbank-Hawa

he six principal methods of solid-waste disposal
general use today, four methods--open dumps,
itary landfill, incineration, and onsite disposal--
y an inherent potential for pollution of water
ources. Seepage of rainwater through the wastes
ches undesirable constituents which reach the
undwater in the area. This leachate is generally
h biologically and chemically contaminated.
extent of the pollution from this leachate is lar-
dependent upon the geologic environment in
ch the solid wastes are deposited. Pollution
ential is highest in permeable areas with a shal-
water table where the wastes are in direct con-
with the groundwater. In a relatively impreme-
area, the pollution is generally confined locally
he vicinity of the waste-disposal site. Regional
well as localized data on the water resources of
area are needed for planning adequate protec-
to the environment in general and the water
ources in particular. (Josefson-USGS)

ntifiers: *Oil spills.

anographic observations were made in a study
the Chevron spilling well off the Mississippi
ta in March, 1970. Surface stress from the wind
most important; at speeds above 15 mph the
k orientation was generally determined by the
d direction. Both calculations and observations
wed that tidal currents produced an L-shaped
k geometry when winds were below about 15
h. The diurnal rotation of the tidal currents served to limit the excursion length of oil from the source, keeping it short of the nearest shore. The presence of fresh water from the Mississippi River in the surface layer and the consequent development of convergence lines often formed a natural barrier, preventing oil from encroaching upon the shore. Theoretical analysis using turbulent diffusion theory predicted that the area and length of a steady-state oil slick increased with oil discharge but decreased with the current speed and the lateral diffusion coefficient. Slick width increased with the rate of discharge and decreased with current speed but was independent of the diffusion coefficient. The width/length ratio of an oil slick, which was notably independent of current speed, was controlled only by the diffusion coefficient and the oil discharge. (Knapp-USGS)

SOURCES OF NITROGEN IN WATER SUPPLIES,
Geological Survey, Denver, Colo.
Marvin C. Goldberg.
In: Role of Agriculture in Clean Water: Iowa State University Press, Chapter 7, p 94-124, 1971. 31 p, 4 fig, 8 tab, 72 ref.

Descriptors: *Nitrogen, *Water pollution sources, *Path of pollutants, *Water chemistry, Farms wastes, Storm runoff, Urbanization, Sewage, Fertilizers, Industrial wastes, Municipal wastes, Soil erosion, Septic tanks, Nitrates, Soil water, Groundwater.
Identifiers: Nitrogen sources (Water pollution).

Sources of nitrogen to water supplies include atmospheric, geologic, biogenic, rural runoff, urban runoff, sewage, irrigation, return flow, animals, sinkholes, caves, feedlots, pollen, rural waste, industrial waste, pond waters, deforestation, and land stripping, among others. Generally, salts of nitrogen applied as fertilizer do not move either vertically or laterally to any significant extent. Nitrate in a nonsalt form seems to have higher soil infiltration capacity than salt nitrogen. This is dependent, however, upon the physical conditions of the soil and the hydrology of the region. In general, industrial waste, rural runoff (including agricultural land and nonagricultural land runoff), farm animal waste, and domestic waste are the dominant sources in surface waters. In groundwater supplies the usual sources of nitrogen are feedlots, privies, septic tanks, or other waste forms. (Knapp-USGS)

RUNOFF, SOLID WASTES, AND NITRATE MOVEMENT ON BEEF FEEDLOTS,
Agricultural Research Service, Lincoln, Nebr.; and Nebraska Univ., Lincoln. Dept. of Agricultural Engineering.
C. B. Gilbertson, T. M. McCalla, J. R. Ellis, O. E. Cross, and W. R. Woods.
Journal Water Pollution Control Federation, Vol 43, No 3, Part 1, p 483-493, Mar 1971. 11 p, 2 fig, 6 tab, 18 ref.

Descriptors: *Farm wastes, *Water pollution sources, *Path of pollutants, *Confinement pens, Runoff, Water quality, Nitrates, Groundwater, Surface waters, Water pollution, Industrial wastes.
Identifiers: *Feedlot wastes.

A study of the effect of feedlot slope and cattle densities on the quantity and quality of runoff resulting from rainstorms and snowmelt, the downward movement of pollutants into the soil profile on unpaved feedlots, and the amount of solids accumulation on the feedlot surface revealed that feedlots with 18.58 sq m/head yielded 5.6 metric tons dry matter/day/ha, whereas those with 9.29 sq m/head yielded 7.6 metric tons/day/ha. Feedlot slope had little effect. About 30 percent of the solids were volatile. Runoff quantity and quality depended more on rainfall than slope or cattle density, but high-density lots yielded 130 to 170 percent more winter runoff than low-density lots. Winter runoff averaged 6.2 to 17.6 metric tons/ha-cm, with about 50 percent volatile. Nitrate movement in soil after 1 yr was minimal. (Knapp-USGS)

DISTRIBUTION OF MERCURY IN UNCONSOLIDATED SEDIMENTS FROM SOUTHERN LAKE MICHIGAN,
Illinois State Geological Survey, Urbana.
E. Joyce Kennedy, R. R. Ruch, and N. F. Shimp.
Illinois Geological Survey Environmental Geology Notes, No 44, Mar 1971. 18 p, 13 fig, 2 tab, 13 ref.

Descriptors: *Trace elements, *Heavy metals, *Bottom sediments, *Lake Michigan, Data collections, Chemical analysis, Sediments, Radiochemical analysis.
Identifiers: *Mercury.

The mercury content of 132 unconsolidated sediment samples from 31 sampling stations in southern Lake Michigan was determined by a radiochemical separation technique. In the deep central portion of the southern part of the lake and in areas west of Benton Harbor, Michigan, and southwest of Grand Haven, Michigan, mercury had accumulated (0.1 to 0.4 part per million) in the uppermost sediment layers. A base level of 0.03 to 0.06 ppm mercury was found at depth in the cores. In sandy areas along the southern and southwestern shores no accumulation of mercury was apparent near the surface of the sediments; an accumulation at a lower interval in these areas is believed to be associated with the presence of metal sulfides. Mercury concentrations in the sediment-water interface samples evidently vary with the organic carbon and total sulfur concentrations of the samples. (Woodard-USGS)

AERIAL SURVEYS OF GREAT LAKES WATER TEMPERATURES, APRIL, 1966 to MARCH, 1968,
Department of Transport, Toronto (Ontario). Meteorological Branch.
T. L. Richards, J. G. Irbe, and D. G. Massey.
Climatological Studies, No 14, p 55, 1969. 93 fig, 11 ref.

Descriptors: *Water temperature, Meteorology, Surface waters, *Isotherms, *Remote sensing, Temperature, Water pollution sources.
Identifiers: *Great Lakes, *Airborne radiation thermometer, Aerial surveys.

This paper describes the instrumentation and technique and publishes the large mass of surface water temperature data collected by 82 Airborne Radiation Thermometers (A.R.T.) in survey flights conducted during two years over the Great Lakes. The temperature data are displayed in the form of analyzed isotherm patterns for each survey and diagrams showing the annual temperature regimes of each lake. Individual surveys and surface water temperature regimes of the lakes as they are related to meteorological factors and the physical characteristics of each lake are discussed. It is concluded that the most evident feature of the surveys is the influence of the depth contour pattern of each lake on the surface water temperature pattern. The relationship between isotherms and depth contour is apparent during both the warming and the cooling seasons. During spring the coldest water invariably remains close to the deep areas with the greatest warming taking place in the shallow nearshore parts of the lake. In autumn the temperature gradient is reversed. (Herrera-Vanderbilt)

BIOLOGICAL METHYLATION OF MERCURY IN AQUATIC ORGANISMS,
Stockholm Univ. (Sweden).
S. Jensen, and A. Jernelov.
Nature, Vol. 223, p 753-754, Aug 16, 1969. 6 ref.

Descriptors: *Path of pollutants, *Heavy metals, Metals, Organic compounds, Carbohydrates, Organic matter, Fish, Water pollution, Water quality, Aquatic animals, Water pollution sources.
Identifiers: Mercury, *Mercury pollution, *Methymercury.

Abnormally large amounts of mercury have been sometimes reported in Swedish fresh water fish. It was shown that the mercury was present almost entirely as methylmercury. Both mono- and dimethyl mercury can be produced in bottom sediments and in rotting fish. The formation of the volatile CH_3HgCH_3 may be a factor in the redistribution of mercury to the environment from aqueous industrial wastes. The tests were performed in an experimental aquarium and results were compared with data obtained from Lake Langsjon. (Novotny-Vanderbilt)

THE ESTUARINE VERSION OF THE COLHEAT DIGITAL SIMULATION MODEL,
Battelle Memorial Inst., Richland, Wash. Pacific Northwest Labs.
D. G. Daniels, J. C. Sonnishsen, and R. T. Jaske.
Battelle Memorial Institute, Atomic Energy Commission Research and Development Report BNWL-1342, UC-70, Richland, Washington, June 1970. 40 p, 25 fig, 7 ref.

Descriptors: *Thermal pollution, *Mathematical models, *Estuaries, *Simulation analysis, Tides, *Temperature, Flow, Flow characteristics, Distribution patterns, Mixing, Thermal powerplants, Water pollution sources.
Identifiers: *COLHEAT digital simulation model.

In order to predict the effects of dam and power plant construction on the temperature in rivers, Battelle's Pacific Northwest Laboratory had developed a river simulation temperature prediction system. The model-COLHEAT river simulation system-has frequently demonstrated its versatility and usefulness. Because many power plants are presently on or planned to be located on estuaries, a simulation model was developed to examine their effects. This model, which is called the estuarine version and is the subject of this report, is a special purpose version of the basic COLHEAT system which allows for volume changes owing to stage variations resulting from tidal action. Homogeneity in the vertical direction has been assumed and, therefore, specific treatment of mixing across the halocline has not been included. Reliable river flow, tidal information, and weather records are necessary to utilize the analysis. Application of the model to the lower Columbia River Estuary is shown. (Oleszkiewicz-Vanderbilt)

VANADIUM CONCENTRATIONS IN COLORADO RIVER BASIN WATERS,
Colorado Univ., Boulder. Dept. of Civil Engineering.
K. Daniel Linstedt, and Paul Kruger.
Journal American Water Works Association, Vol 61, No 2, p 85-88, Feb 1969. 2 fig, 3 tab, 4 ref.

Descriptors: *Heavy metals, *Trace elements, Path of pollutants, *Neutron activation analysis, *Colorado River basin, Water pollution sources, Analytical techniques, *Mine wastes.
Identifiers: *Vanadium, Uranium mills.

Vanadium is a trace element in water supplies which is of significance in water quality control research because of its possible physiological effects; for example, it has been shown at low intake levels to act in the inhibition of cholesterol synthesis. The success of the studies on vanadium concentrations in natural waters in the Colorado River basin was based on the specific development of a sensitive neutron activation analysis procedure which allowed for sensitivity of 0.1 micrograms of vanadium. Vanadium concentrations in samples throughout the Colorado River basin varied between 0.2 and 49.2 micrograms/liter over the 15-month period of the study. The lowest amounts of vanadium were found upstream from any industrial activity. Highest concentration values were found at the sampling sites in the vicinity of the uranium-vanadium milling operations. (Oleszkiewicz-Vanderbilt)

MERCURY-LAMP POLLUTION: HOW MUCH OF A PROBLEM.

Electrical World, Vol 175, No 4, p 100, Feb 15, 1971. 1 tab.

Descriptors: *Landfills, *Heavy metals, Leaching, Waste disposal, Water pollution sources, Public health.
Identifiers: *Mercury consumption, *Mercury lamp disposal, Sanitary landfill.

Annual mercury consumption in the United States is presented on the basis of date from 1969. Some 26.2% of the total 6,011,828 lbs. of mercury/year used for electrolytic preparation of chlorine and soda. The second major consumer is the electrical equipment industry (including lamps)-23.5%. The electrical equipment companies are concerned with the possible health hazards and environmental problems connected with the disposal of used lamps, as some 40-50 mg of mercury is used in a single typical 40-w 4 ft. or 75-w 8 ft. flourescent lamp. The Sylvania Electric Products, Inc. spokesman pointed out that proper location of the landfill tract would prevent the mercury from entering waterways. The Sylvania's calculations based on 205.5-million population and 2,000 lbs. of refuse per person per year have indicated that the mercury from lamps would produce a level of about 0.06 ppm when mixed with other refuse. The latter is reported to be close to the natural amount found in soil. (Oleszkiewicz-Vanderbilt)

escriptors: *Radioactive dating, *Sediments,
iota, *Pacific Ocean, Nuclear explosions, Fal-
ut, Sampling, Methodology.
entifiers: *Silver radionuclide (Ag-108m).

e occurrence of the long lived silver
dionuclide Ag-108m in biota from the Pacific
ean suggests that the silver radionuclide ratio
g-110m/Ag-108m may be useful as a tracer of en-
onmental processes. It also appears that large
ounts of Ag-110m and Ag-108m were not
oduced during the 1958 Nuclear test series or
rlier, and that the production activity radio Ag-
0m/Ag-108m was 162, a ratio derived solely
om the termal neutron activation of stable silver.
e radionuclide was first detected in a composite
mple of the hepatopancreases of spiny lobsters
llected at Bikini Atoll in 1969, and its concentra-
n has since been measured in several samples
om Bikini and Eniwetok Atolls. Gamma-ray spec-
were made using both NaI (TI) and a solid state
(Li) detector system. Comparison of the con-
ntrations of Ag-108m in the hepatopancreas of
ny lobsters shows that the Bikini specimens con-
n 2 to 3 times more Ag-108m than those from
iwetok Atoll. (Woodard-USGS)

nce the discovery of methyl mercury formation in
ce sediments contaminated with inorganic or
enyl mercury, there has been a good deal of
eculation about the mechanism of this synthesis.
e process involving methyl-cobalamin (a B12-
rivative) was demonstrated in cell-free extracts
methanogenic bacteria. Since vitamin B12 is not
own to be involved in the metabolism of Neu-
spora, the biosynthesis of methyl mercury in this
ganism, where the pathway should be different,
s investigated. The possibility that the methyla-
n of mercury in vivo is achieved by means of a
ect transmethylation involving methionine or S-
enosyl-methionine seems less likely on the
dence provided by preliminary experiments with
urospora (unpublished results of A. Jernelov
d L. Landner and personal communication with
Kitamura). In no case was an increased yield of
thyl mercury found when L-methionine was
ded to the HgC12-containing medium.

MICROBIAL DEGRADATION OF THE HERBICIDE ATRAZINE AND ITS 2-HYDROXY ANALOG IN SUBMERGED SOILS,
Hawaii Univ., Honolulu. Dept. of Agronomy and Soil Science.
Kishore P. Goswami, and Richard E. Green.
Environmental Science and Technology, Vol 5, No 5, p 426-429, May 1971. 4 p, 4 fig, 2 tab, 16 ref.

Descriptors: *Biodegradation, *Herbicides, *Aquatic soils, *Bottom sediments, Tracers, Tagging, Path of pollutants, Pesticide kinetics, Carbon radioisotopes, Hydrolysis, Chromatography.
Identifiers: *Atrazine.

Soil-applied pesticides transported by erosion from the site of application to waters and sediments are subject to conditions sufficiently different from those of aerated soils to alter pesticide persistence. Microbial degradation of atrazine and its 2-hydroxy analog (hydroxyatrazine) in submerged soils was studied by measurement of C-14 in evolved C02 and chromatographic separation of metabolites in soil extracts. Chemical hydrolysis of atrazine to hydroxyatrazine is the principal pathway of detoxication in soil and is conductive to ring cleavage and total breakdown by microbes. Biological dealkylation without dehalogination occurs simultaneously. Total breakdown of atrazine should be slower in submerged sediments than in aerated soils because of the higher pH and restricted aeration of sediments. (Knapp-USGS)

Identifiers: *Mercury, *Mercury pollutants.

Mercury cycle disperses the metal through the lithosphere, hydrosphere and atmosphere and through the biosphere, which interpenetrates all three. Mercury is present in all spheres in trace amounts, but it tends to be concentrated by biological processes. Man's activities, in particular certain industrial processes, may now present a threat by significantly redistributing the metal. Methyl mercury compounds are the most injurious ones. Mercury discharged into water in various forms can be converted by bacteria in detritus and sediments into methyl and dimethyl mercury. Phenyl mercurials, metallic mercury and methoxyethyl mercury are converted into methyls primarily through ionic mercury. Major use of mercury has been as a cathode in the electrolytic preparation of chlorine and caustic soda. In this process a large inventory of mercury is continuously recycled, but in 1968, 23 percent of total mercury demand still went to make up what was wasted. Another 10 percent went for start-up of new plants. Since then legislation and lawsuits have required manufacturers to increase recycling sharply, reducing emissions to the environment. ENVIRONMENTAL MERCURY RESEARCH IN SWEDEN,
Swedish Environment Protection Board, Stockholm.
J. E. Larson.
Swedish Environment Protection Board, Stockholm, June 1970. 3 fig, 4 tab, 56 ref.

Descriptors: *Heavy metals, Water pollution, Water pollution effects, Metals, Environmental engineering, Air pollution, Human diseases, Public health, Waste disposal, Human pathology, Animal pathology, Toxicity, Water quality, Industrial wastes, Water pollution sources, *Lethal limit.
Identifiers: *Mercury pollution, Mercury.

The history of the mercury pollution problem is presented, followed by an account of the research which was initiated as a consequence. Decisions of the administrative authorities with regard to allowable concentrations within the mercury field are reported together with the effects of these decisions and measures. The demands for research and corrective measures in order to reduce the deleterious effects as a result of mercury contamination of the environment are described. An economic outline of the research efforts is given in schematic form. Particular attention is paid to the water environment. (Novotny-Vanderbilt)

An interim guideline for surplus or waste pesticides and pesticide container disposal has been drawn

from the combined important points of three Working Group reports, Ground Disposal of Pesticides: The Problem and Criteria for Guidelines; Proceedings of National Working Conference on Pesticide Disposal; and Information Available on Handling Surplus Pesticides, Empty Containers and Emergency Situation. Presented in concise form for ready reference, the subjects of ocean disposal (not recommended), ground disposal and incineration (air disposal) are reviewed. Orientation as to different pesticide users: householders, farm operators, commercial operators, governmental authorities, industrial users, formulators, manufacturers. Ground disposal, its attendant precautions and controls, are discussed as well as methods and disposal site requirements. Incineration technology to date is outlined as the most applicable method of disposal for large amounts of toxic wastes and unusable pesticides. Sections on collection systems as practiced and recommended in various areas including transportation of surplus pesticides and containers, storage considerations with fire and safety precautions, disposal site monitoring and suggested research bring the whole problem into focus. The summary of guidelines provides preliminary guidance with expectation of revision when more definitive solutions are available. Not a set of specific recommendations on disposal.

PROCEEDINGS OF THE NATIONAL WORKING CONFERENCE ON PESTICIDE DISPOSAL, AT NATIONAL AGRICULTURAL LIBRARY, BELSVILLE, MARYLAND, JUNE 30 and JULY 1, 1970.
Working Group on Pesticides, Washington, D.C.

Available from the National Technical Information Service as PB-197 145, $3.00 in paper copy, $0.95 in microfiche. Working Group on Pesticides, Report DR-2, Wash, DC, Sept 1970. 139 p.

Descriptors: Landfills, Solid wastes, Water pollution, *Pesticides, *Waste disposal, *Insecticides, *Herbicides, *DDT, Fungicides.
Identifiers: *Incinerators, Hazardous materials, Decontamination, Waste recycling, *2-4-5-T herbicide.

The report is a volume of collected papers delivered before the National Working Conference on Pesticide Disposal by federal, state and industrial officials knowledgeable in various aspects of pesticide disposal; Reports from the Chemical Specialties Manufacturers Association and the National Agricultural Chemicals Association provide industry input; Container size and type, and farmers' use of pesticides and pesticide containers are discussed by the U.S. Department of Agriculture. Reports on Connecticut Florida, Massachusetts, Michigan and Wisconsin are given by officials from these states and programs in the other states are summarized by the National Association of State Departments of Agriculture. Considerations Preliminary to Development of a Waste Pesticide Management System, recall and disposal problems caused by the suspension of 2,4,5-T, Department of Transportation regulations on hazardous materials, Department of Defense disposal program and Air Pollution Problems of Pesticide Disposal are presented by federal and industrial officials. Research on incineration technology, necessary conditions for proper decontamination and combustion of organic pesticides and pesticide containers, and the application of solid waste research to pesticide disposal are reported by university, industry and federal researchers. Information and education programs, and federal coordination are reivewed by federal education and information specialists.

GROUND DISPOSAL OF PESTICIDES: THE PROBLEM AND CRITERIA FOR GUIDELINES.
Working Group on Pesticides, Washington, D.C.

Available from the National Technical Information Service as PB-197 144, $3.00 in paper copy, $0.95 in microfiche. Working Group on Pesticides Report DR-1, Wash, DC, Mar 1970. 54 p.

Descriptors: Waterwells, Water supply, Injection wells, Landfills, Lagoons, Sewers, Solid wastes, Aquifers, *Pesticides, *Waste disposal, *Insecticides, *Herbicides, *Water pollution, Groundwater.
Identifiers: Pesticides, Agricultural wastes.

A document that states the problem of ground disposal of pesticides, and examines the extent to which contamination occurs in wells and groundwater, discusses the types of pesticide wastes, and considers interactions between pesticides and soils and pesticides and groundwater. It looks into sources of pesticides to be disposed of, describes methods of ground disposal, develops criteria for decision to dispose of pesticide wastes to the subsurface the selection of a disposal zone including a decision matrix, and summarizes disposal site maintenance and monitoring criteria. It concludes with proposed industrial guidelines for pesticide waste disposal. States that the magnitude of contamination threat to groundwater resources from improper ground disposal is dependent upon the physical, chemical, biological and toxicological properties of the pesticidal waste, the hydrogeological characteristics of the disposal site and the volume, state (liquid or solid) and persistence of the waste. The well-developed technology of occurrence and movement of groundwater should be applied to each individual disposal site, to the type of pesticide wastes and to the method under consideration. Nine recommendations on the problem are offered.

ON THE USE OF PHOSPHAMIDON FOR ERADICATION OF FRESH WATER FISH PREDATORS,
Bihar Univ., Muzaffarpur (India). Dept. of Zoology.
U. S. Srivastava, and S. K. Konar.
Summary in German. Experientia, Vol 21, No 390, p 1-3, 1965. 1 tab, 2 ref.

Descriptors: *Pesticide toxicity, *Bioassay, *Fish control agents, *Insect control, Mortality, Fish management, Fish farming, Fish establishment, Carp, Predators, Fish toxins, Lethal limit, Insecticides, Chemcontrol.
Identifiers: *Phosphamidon, *Fish predators, Labeo rohita.

The effectiveness of using the insecticide phosphamidon to control predatory fishes and aquatic predatory insects from fish nursery and rearing ponds, without causing damage to the fish being raised, was determined. Bioassays were conducted to determine the minimum lethal doses of phosphamidon on the test fish and insects. All insect predators were unable to survive even as low a concentration as 10 ppm or lower. Most insect predators can be eradicated from freshwater reservoirs without effecting the fish population, and by employing 100-125 ppm of phosphamidon, most of the predatory fish can also be removed. (Sjolseth-Washington)

LABORATORY STUDIES ON TWO ORGANOPHOSPHOROUS INSECTICIDES, DDVP AND PHOSPHAMIDON, AS SELECTIVE TOXICANTS,
Kalyani Agriculture Univ. (India). Dept of Zoology.
S. K. Konar.
Transactions of the American Fisheries Society, Vol 98, No 3, p 430-437, 1969. 4 tab, 15 ref.

Descriptors: *Bioassay, *Fish food organisms, *Fish control agents, Carp, Toxicity, Organophosphorous pesticides, Fish management, Laboratory tests, Water pollution effects, Aquatic insects, Fish farming, Persistence, Hydrogen ion concentration, Turbidity, Resistance, Phytoplankton, Zooplankton, Eels.
Identifiers: Labeo rohita, *DDVP, *Phosphamidon, *Selective toxicants, Tolerance, Susceptibility, Detoxification.

The cultivated carp, Labeo rohita, showed greater tolerance of both DDVP and phosphamidon than nearly all of twelve undesirable fish species and all of nine predacious aquatic insects tested, so that both of these toxicants exhibited conveniently selective activity. Variations of pH between 5.8 and 8.8, and of turbidity between 125 and 1000 ppm had little or no influence on the toxicity of DDVP. The toxicity of phosphamidon was reduced slightly in acidic water and more markedly in turbid water. Phytoplankters are more resistant to DDVP and to phosphamidon than are zooplankters. The most important food organisms, as well as the predacious insects, are much more susceptible to these insecticides than are the tested fishes. The toxicity of phosphamidon appears to be more persistent than that of DDVP. (Sjolseth-Washington)

POSSIBLE SELECTIVE MECHANISMS IN THE DEVELOPMENT OF INSECTICIDE-RESISTANT FISH,
Mississippi State Univ., State College. Dept. Biology.
Mack T. Finley, Denzel E. Ferguson, and J. Larry Ludke.
Pesticides Monitoring Journal, Vol 3, No 4, p 21-218, 1970. 2 fig, 4 tab, 14 ref. USPHS Grants 00086 and FD-00134-01.

Descriptors: *Resistance, *Runoff, *Pesticide residues, *DDT, Bioassay, Fishkill, Gas Chromatography, Selectivity, Mississippi, Water pollution sources, Water pollution effects, Pesticide kinetics, Mosquito fish, Sunfishes, On-site investigations, Toxicity, Chlorinated hydrocarbon pesticides.
Identifiers: *Selective mechanisms, *Insecticide resistant fish, *Toxaphene, DDD, DDE, Susceptibility.

Results of bioassays and gas chromatographic analyses show that populations of insecticide-

stant fish from near heavily treated cotton fields Belzoni, Miss., are subjected to relatively brief ir-gular periods of selection after rains. Runoff from tton fields increased mortality among caged sceptible and native resistant fish. Feeding of en-in-exposed and field-collected resistant osquitofish (Gambusia affinis) to resistant and sceptible green sunfish (Lepomis cyanellus) owed that selective pressure from residues in the od chain was minimal, compared with direct ex-sure, provided the consumer was resistant. Live-ge bioassays at top and bottom depths revealed insecticide stratification in the water. Residue alyses revealed DDT and toxaphene as the two secticides of selective importance. DDT and tox-hene residues increased in whole fish and water mples after runoff. High DDT values, compared th those of DDD and DDE, suggested recent con-mination. (Sjolseth-Washington)

entifiers: Paralytic shellfish poison, Venerupin, guatera, Saxitoxin, Aluterin, Tetrodotoxin, toxification.

e hypotheses on transport of toxins through rine food chains are reviewed. The transfer of itoxin (paralytic shellfish poisoning) from oflagellates to shellfish is considered to be the ly satisfactorily established example. Similarly, guatoxin is the only example considered to pass rough several trophic levels without modifica-n. Some species apparently contain several tox-concurrently, indicating a complex relationship tween food webs and the passage of toxins rough them. Passage of poisons through food ains should be proposed only cautiously, as reign substances are usually metabolized or idly excreted by detoxification mechanisms in ganisms. More data are required to substantiate food chain hypothesis. (LeGore-Washington)

EFFECTS OF POLYSTREAM AND DRILLEX ON OYSTER SETTING IN CHESAPEAKE BAY AND CHINCOTEAGUE BAY,
Bureau of Commercial Fisheries, Oxford, Md. Biological Lab.
William N. Shaw, and George T. Griffith.
National Shellfisheries Association 1966 Proceedings, Vol 57, p 17-23, June 1967. 1 fig, 4 tab, 4 ref.

Descriptors: *Oysters, *Evaluation, *Growth rates, *Toxicity, *Chlorinated hydrocarbon pesticides, Commercial shellfish, Spawning, On-site investigations, Antifouling materials, Fouling, Water pollution effects, Pest control, Cultural control, Chem-control, Organic compounds, Aquiculture, Chemicals.
Identifiers: *Polychlorinated benzenes, *Benzene, *Polystream, *Drillex, *Oyster setting, *Spawning success, Chesapeake Bay, Chincoteague Bay, Sevin, Cultch, Chlorinated benzenes.

The possibility of increasing the yield of oyster spat, Crassostrea virginica, in Chesapeake and Chincoteague Bays by treating shells with Polystream or with Drillex was tested during 1963. Field studies were also conducted in Watts Bay, Virginia, to determine if the use of Drillex-treated sand in combination with Polystream-treated shells increased oyster setting. Significantly more oysters were caught on both Polystream-treated and on Drillex-treated shells than on untreated shells when they were suspended either in the intertidal zone or placed on the bottom of Chincoteague Bay, and off the bottom in the Tred Avon River. Although in many cases more oysters were caught on chemically-treated shells, Polystream and Drillex apparently did not repel the principal fouling organisms in Chincoteague and Chesapeake Bays. In Watts Bay, setting was greater on plots with Polystream-treated shells and with Drillex-treated sand than on either control plots (untreated shells only) or on plots with just Polystream-treated shells. (Sjolseth-Washington)

OCCURRENCE AND SIGNIFICANCE OF DDT AND DIELDRIN RESIDUES IN WISCONSIN FISH,
Wisconsin Dept. of Natural Resources, Madison.
Stanton J. Kleinert, Paul E. Degurse, and Thomas L. Wirth.
Wisconsin Department of Natural Resources Technical Bulletin No 41, 1968. 43 p, 2 fig, 3 tab, 49 ref. Wisc Conservation Commission Grant, and US Bureau of Sport Fisheries and Wildlife Funds.

Descriptors: *DDT, *Dieldrin, *Pesticide residues, *Chlorinated hydrocarbon pesticides, Wisconsin, Water pollution effects, Water pollution sources, On-site data collections, Pesticide toxicity, Freshwater fish, Public health, Analytical techniques, Gas chromatography, Pesticide kinetics, Pesticide removal, Fish reproduction, Pest control, Monitoring, Control.
Identifiers: DDD, DDE, Spraying, Recommendations.

Five hundred fifty-five whole fish samples representing 2,673 fish of 35 species were collected from 109 inland lakes and streams of Wisconsin and analyzed for DDT and Dieldrin residues. All of the fish samples contained DDT and 70% contained Dieldrin. DDT levels ranged from 0.222 to 534.6 ppm and averaged 27.15 ppm. Dieldrin levels ranged from 0.026 to 670.2 ppm and averaged 6.15 ppm. These values were expressed relative to the 'fat basis.' Immediate and long-term concerns of the significance of DDT and of Dieldrin residues were discussed. Specific recommendations were listed in an effort to reduce the future threat imposed by the use of persistent pesticides. (Sjolseth-Washington)

THE INFLUENCE OF OXYGEN TENSION ON THE PRESSURE RESISTANCE OF SOME MARINE INVERTEBRATES (In German),
Kiel Univ. (West Germany). Institut fuer Meereskunde.
H. Theede, and A. Ponat.
Marine Biology, Vol 6, No 1, p 66-73, May 1970. 5 fig, 4 tab, 43 ref.

Descriptors: *Resistance, *Hydrostatic pressure, *Invertebrates, *Animal physiology, *Animal metabolism, *Mode of action, Water pollution effects, Mussels, Dissolved oxygen, Laboratory tests, Hydrogen ion concentration, Respiration, Environmental effects, Biochemistry, Enzymes, Inhibition, Oxygen, Oxygenation, Oxygen requirements, Marine animals.
Identifiers: *Oxygen tension, *Pressure resistance, Lactic acid, Cyanide.

Variations in oxygen tension exert a considerable influence on the resistance of invertebrates to high hydrostatic pressure. Pressure resistance of whole animals (Idotea baltica, Cyprina islandica) and of isolated tissues (gill tissues of C. islandica and Mytilus edulis) is higher in a medium not fully air saturated; it decreases with increasing oxygen tension to about air saturation or higher. In some spp. pressure resistance decreases when D.O. is almost absent. Oxygen tension influences pressure resistance not only during exposure to increased pressure, but pressure resistance increases in isolated tissues kept under oxygen deficiency prior to the experiment. Lactic acid, a result of anaerobic glycolysis, increases cellular pressure resistance only if its presence is combined with decreased pH values. Metabolic inhibition with cyanide does not increase pressure resistance. It is suggested that the primary reasons for lowered pressure resistance at saturation or higher oxygen levels are oxidation and inhibition of sensitive thiol enzymes under pressure. Decrease of pressure resistance at extreme degrees of oxygen deficiency may be caused by insufficient rates of ATP synthesis. (Sjolseth-Washington)

EFFECT OF LOW DISSOLVED OXYGEN CONCENTRATIONS ON THE VENTILATION RHYTHM OF THREE TUBICOLOUS CRUSTACEANS, WITH SPECIAL REFERENCE TO THE PHENOMENON OF INTERMITTENT VENTILATION,
University Coll. of North Wales, Menai Bridge. Marine Science Labs.
J. C. Gamble.
Marine Biology, Vol 6, No 2, p 121-127, June 1970. 8 fig, 32 ref.

Descriptors: Ventilation, Behavior, *Amphipoda, *Crustaceans, Invertebrates, Animal physiology, *Dissolved oxygen, Respiration, Oxygen requirements.
Identifiers: Pleopods, Peracaridean, Corophium sp., Marinogammarus sp., Tanais sp., Tubicolous crustaceans.

The pleopod ventilatory activity of the tube-dwelling amphipods, Corophium volutator and C. arenarium is intermittent. Unlike the free-living amphipod Marinogammarus obtusatus, which increases its rate of pleopod beating, the pleopod beat rate of both Corophium spp. is unaffected by low oxygen concentrations. However, the nature of the intermittent ventilation rhythm is altered so that, at low D.O., the pleopods of Corophium beat almost continuously. It is suggested that the intermittent ventilation of Corophium can be interpreted as an adaptation to a tubicolus existence. The peracaridean Tanais chevreuxi has 2 independent ventilatory systems, the maxilliped epipodites and the pleopods. The former, which respond to low D.O., are thought to be the principal respiratory organs of T. chevreuxi, while the pleopods, which show no response to low D.O., are believed to be primarily concerned with filter feeding. ENVIRONMENTAL CONSIDERATIONS IN THE RECYCLING OF HIGH TEMPERATURE WATER,
Department of the Interior, Washington, D.C.
Lewis Orme, Jr.
Proceedings, 14th Annual Arizona Watershed Symposium, Phoenix, Sept 23, 1970, p 27-30, 1971. 3 fig, 1 tab.

Descriptors: *Thermal pollution, *Water Quality Act, *Environmental effects, *Temperature control, *Pollution abatement, Towers, Arid lands, Thermal powerplants, Thermal stress, Arizona, Economic feasibility, Water assimilative capacity, Water quality.

About 95% of all precipitation in Arizona is consumed by evaporation or transpiration. Also, the major river, the Colorado, is high in both salts and silt. However, water pollution is not currently a major problem in the state. Of all the potential pollution problems, the author considers thermal pollution the least understood. The U.S. is the world's highest energy consuming country, and consumption is doubling every ten years. It is estimated that within 20 years, 95% of all power generation will be thermal, and within 30 years, 1/2 - 1/3 of the average daily fresh water runoff in the U.S. will be used to cool electric power stations, raising its temperatures 10-20 deg in the process. In heated waters, oxygen content decreases, which together with higher temperature, decreases the viability of equatic organisms and lowers the capacity of the stream to assimilate other wastes. Fortunately, the Federal Water Quality Act of 1965 set federal-state guidelines for control of thermal pollution and this was subsequently implemented by appropriate legislation in Arizona. Thermal pollution control measures are available, but their use is complicated by economic factors. The best technique, dry closed system towers, is also the most expensive. Rigorous planning is necessary to assure environmental quality in the process of increasing power production. (Casey-Arizona).

THERMAL EFFECTS FROM STEAM-ELECTRIC POWER PLANTS,
American Institute of Chemical Engineers, Nuclear Engineering Division.
W. P. Bebbington.
For sale by Superintendent of Documents, US Govt Printing Office, Washington, DC, 20402, Price $3.50. Hearings before the Joint Committee on Atomic Energy, Congress of the United States on Environmental Effects of Producing Electric Power, Part 2, Vol 2, p 2463-2467, Jan 27-30, Feb 24-26, 1970. 1 tab, 2 ref.

Descriptors: *Powerplants, *Thermal pollution, Efficiencies, Safety, Cooling water, Radioactivity, Water pollution effects.
Identifiers: Nuclear, Fossil-fuel, Waste heat.

National average of heat rate and heat to environment of a fossil-fueled, steam-electric generating plant is 10432 and 6848 Btu per kw-hr respectively. Ordinarily about a third of the heat released to the environment by a fossil-fueled plant is by way of the stock and two-thirds by way of the condenser. In the nuclear plant all of the heat released to the environment is by way of the condenser cooling water. Average heat absorbed from the sun by the earth's surface is about 1000 megawatts per square mile. Nuclear power plants emit a slight amount of radioactivity. Fossil-fueled plants emit gaseous products of combustion and fly ash. The choice between nuclear fuel and fossil should be based on local situation such as cost of fuel, population density, water supply, etc. (Upadhyaya-Vanderbilt)

THERMAL EFFECTS OF ELECTRIC POWER PLANTS,
Pacific Gas and Electric Company, Emeryville, California.
James R. Adams.
Proceedings of the Joint Committee on Atomic Energy hearings on Environmental Effects of Producing Electric Power, Feb 24-26, 1970, Wash, DC.

Descriptors: *Thermal pollution, *Thermal power plants, Fish, Temperature, Aquatic life, Biota, California, Estuaries, Marine fish, Ecology, Aquatic habitats, Water pollution, Water quality, Path of pollutants, Pacific Coast Region, Water pollution effects.
Identifiers: Temperature effects.

The effect of thermal power stations on aquatic life and water quality have been extensively studied. Screens and intake structures have been extensively studied. Screens and intake structures have been designed which keep the large fish out of the cooling water system, while smaller fish can actually be passed through the plants without harm. The main effect on other forms of marine life is a dominance of warm tolerant forms in the immediate area of the discharge. Monitoring of water quality around thermal stations does not indicate changes in dissolved oxygen levels or other important parameters. Reasonable predictions of the impact of a thermal power plant on the marine environment can be made by combining ecological studies with a prediction of the thermal regime at that site. Water temperature criteria should be flexible, and each power plant should be examined as a special case. (Novotny-Vanderbilt)
W71-07325

THERMAL POWER, AQUATIC LIFE, AND KILOWATTS ON THE PACIFIC COAST,
Pacific Gas and Electric Company, Emeryville, California.
James R. Adams.
Proceedings of the American Power Conference, Vol 31, 1969.

Descriptors: *Aquatic life, *Thermal pollution, California, Fish, Temperature, Estuaries, Ecology, Marine fish, Water quality, Thermal powerplants, Salmon, Isotherms, Mapping, Aquatic habitats, Coasts, Dissolved oxygen, Pacific Coast Region, Water pollution effects.
Identifiers: Temperature effects.

The paper summarizes some representative studies carried out at thermal power stations in both estuaries and open ocean environments of California. The studies were performed on the thermal tolerance of selected aquatic organisms (fish, oysters). The hazards to a small fish from a trip through the cooling water system were compared to hazards from intake screen impingement by flume temperature experiments and by actual passage through an operating condenser. Salmon passed through the condenser and had no fatalities in 10 separate tests. The use of surface isotherm maps is also discussed. It was also concluded that the temperature increase imposed by the passage of cooling water through operating thermal stations in tidewater does not cause a change in the DO content of the water. Natural temperature fluctuations considerably exceeded the heat loadings imposed by the thermal powerplants. (Novotny-Vanderbilt)

MERCURY IN THE MARINE ENVIRONMENT,
Scripps Institute of Oceanography, La Jolla, Calif.
David H. Klein, and Edward D. Goldberg.
Environmental Science and Technology, Vol 4, No 9, p 765-767, Sept 1970.

Descriptors: *Heavy metals, Water pollution, *Sea water, Metals, Industrial wastes, Marine fish, Marine bacteria, Marine plants, Oceans, Sediments, Organic compounds, Biochemistry, Path of pollutants, Marine animals, Water pollution effects.
Identifiers: Mercury, *Mercury pollution.

Mercury levels in coastal marine organisms are several orders of magnitude greater than in comparable volumes of sea water. Also, higher values of mercury are found in sediments near sewer outfalls as compared to similar deposits further removed from the outfalls. High mercury content in sediments on the east Pacific Ridge may be explained by high organic productivity rather than on the basis of vulcanism or hydrothermal activity. The effects of sewer outfalls on the mercury content of marine sediments were investigated. Near the outfall, the mercury content of the sediments is as much as fiftyfold higher than presumably uncontaminated sediments further away. Industrial and agricultural dispersion of mercury compounds involves organisms by their ingestion of both compounds of this element, and of the element itself. (Novotny-Vanderbilt)

PARAMETRIC STUDY OF POWER PLANT THERMAL POLLUTION,
Newark Coll. of Engineering, N.J.
Amir Nahavandi, and John Campisi.
Journal Water Pollution Control Federation, Vo 43, No 3, p 506-514, Mar 1971.

Descriptors: *Powerplants, *Thermal pollution *Temperature, *Condenser, Stream, Mathematica models, Water pollution effects, Computer pro grams.
Identifiers: Parametric study, Power capability fac tor, Recirculation factor.

The power capability and thermal pollution effec of stream power plants located on rivers or stream were analyzed to determine the power capabilit for a given downstream temperature. The equa tions for condenser cooling water were derived an nondimensionalized and a minimum number o dimensionless parameters introduced. By means o a digital computer program, charts were develope that show that power capability and thermal pollu tion factors (ratio of downstream temperature t condenser temperature, both referred to a mospheric) are direct and inverse linear function respectively, of upstream temperature factor (rati of upstream and condenser discharge temper tures, both referred to atmospheric). Increase dilution factor improves power capability facto and increases thermal pollution factor; increase recirculation factor adversely affects power capa bility factor and decreases thermal pollution facto (Oleszkiewicz-Vanderbilt)

entifiers: *Test development, *Test problems, ormidium sp.

few considerations are given about the testing of gicides incorporated in paints and stony materi- s. Two experimental designs are described: one r testing algicidal paints with aquatic algae, and ie for testing algicidal asbestos-cement with aerial gae. For the first purpose a static test is undesira- e because of the building up of toxic concentra- ns in the medium whereas the actual toxicity at e surface of the material should be measured. A evice is proposed that uses a continuously innocu- ted medium flowing slowly through a test aquari- n. For the testing of asbestos-cement and other kaline stony materials with aerial algae it is found at the availability of CO2 near the surface may be limiting factor. Another device is described to st samples in a flow of air enriched with 5% CO2. jolseth-Washington)

ETHAL EFFECTS OF THE INSECTICIDE DVP ON THE EGGS AND HATCHLINGS OF HE SNAKE-HEAD, CHANNA PUNCTATUS L.) (OPHIOCEPHLIFORMES: PHIOCEPHALIDAE),
lyani Agricultural Univ. (India). Dept. of Zoolo- .
shil Kanta Konar.
panese Journal of Ichthyology, Vol 15, No 3, p 0-133, 1969. 1 fig, 1 tab, 15 ref.

escriptors: *Bioassay, *Viability, *Resistance, ethal limit, Toxicity, Mortality, Or- nophosphorous pesticides, Fish eggs, Hatching, hibition, Fish physiology, Juvenile fishes.
entifiers: *DDVP, *Channa punctatus, latching time, *Hatching success, Hatchlings, edian survival time, Susceptibility.

aboratory bioassays were made at 66-75 F to termine the effects of the organophosphorous sticide DDVP on the viability of the snake-head awn and hatchlings. Sixteen different concentra- ns ranging from 0.10 to 20.0 ppm were tested ainst duplicate samples of eggs placed in cylindri- glass jars holding 8 litres of unchlorinated ter. The eggs hatched at all test concentrations. tching time increased with increased concentra- n. All eggs hatched at concentrations up to 1.0 m within 12 hr. Within the same period, about % of the eggs hatched at 1.6 to 16 ppm, and 55% tched at 20 ppm; the remaining eggs hatched thin 24 hr. Yolk sac absorption was normal at 0 ppm. The yolk absorption gradually decreased 1.6 to 4.0 ppm, and totally stopped at 5.0 ppm ater. The hatchlings were many times more sen- ive to DDVP than the eggs. The median survival te of hatchlings gradually decreased with the in- ease of concentration. The eggs and hatchlings survived well at 0.10 ppm DDVP. (Sjolseth-Washington)

NICOTINE AS A FISH POISON,
Kalyani Agricultural Univ. (India). Dept. of Zoology.
S. K. Konar.
The Progressive Fish Culturist, Vol 32, No 2, p 103-104, Apr, 1970. 1 tab.

Descriptors: *Chemcontrol, *Fish control agents, *Carp, *Toxins, Aquatic insects, Fish management, Poisons, Toxicity, Pest control, Pesticides, Pesticide toxicity, Bioassay, Laboratory tests, Fish food organisms.
Identifiers: *Nicotine, *Labeo rohita, *Puntius sophore, *Ranatra filiformis, *Dytiscus sp., Sodium cyanide.

A pesticide that permits rapid and inexpensive live-capture of fish is described. The water soluble plant alkaloid nicotine (1-methyl-2- (3-pyridyl) pyrrolidine) offers some interesting possibilities for this purpose. Quick surfacing and rapid total recovery of the fish removed from the test concentrations were encountered. Recovery time was 2-4 minutes. The aquatic insects tested did not surface at any of the concentrations tested, and were apparently unaffected by the concentrations required to live-capture fish. (Wahtola-Washington)

A NITROGEN GAS DISEASE CATASTROPHE,
Oregon Fish Commission, Clackamas; and Bureau of Commercial Fisheries, Astoria, Oreg.
Ellis J. Wyatt, and Kirk T. Beiningen.
Proceedings of the 20th Annual Northwest Fish Culture Conference, Dec 3-4, 1969, Washington Dept of Game, Olympia, p 71-72.

Descriptors: *Nitrogen, *Fishkill, *Fish passages, *Fish diseases, Pathology, Mortality, Salmon, Gases, Fish handling facilities, Fish hatcheries, Fish management, Fish physiology, Fish toxins, Fish conservation, Water pollution effects, Water pressure, Bioassay, Rainbow trout.
Identifiers: *Chinook salmon, *Gas embolism, *Gas bubble disease.

A severe fish loss is described at the Fish Commission of Oregon's South Santiam Fish Hatchery. Approximately 75-95% of the stock died of gas embolism. Attempts were made to recreate the conditions. Nitrogen gas concentrations were approximated at 175% saturation. Fish died 2 min after first showing signs of abnormal behavior. An LT (100%) (N — 476 fish) occurred at 295 minutes. (Wahtola-Washington)

CATFISH CULTURE IN EFFLUENT WATER,
State Coll. of Arkansas, Conway.
Richard A. Collins.
The Catfish Farmer, Vol 2, No 3, p 7-11, 1970. 7 fig, 1 tab.

Descriptors: *Channel catfish, *Fish farming, *Thermal pollution, *Temperature, Growth rates, On-site investigations, Spawning, Aquiculture, Fish stocking, Catfishes, Thermal water, Texas, Mississippi, Cooling water, Beneficial uses, Mississippi, Texas.
Identifiers: *Cage culture, Feeding cages, Quinaldine.

Channel catfish were cage-reared in Lake Hico, Mississippi and in Lake Colorado City, Texas, which were used as cooling reservoirs by utility companies. Catfish can be reared in the winter in thermal effluents with the same degree of success associated with other lakes in the warmer months. (Wahtola-Washington)
W71-07343

AN INVESTIGATION OF ELEPHANT SEAL AND SEA LION MORTALITY ON SAN MIGUEL ISLAND,
Naval Undersea Research and Development Center, Point Mugu, Calif. Marine Bioscience Facility.
J. G. Simpson, and W. G. Gilmartin.
Bio-science, Vol 20, No 5, p 289, Mar 1, 1970. 2 ref.

Descriptors: *Mortality, *Oily water, *Oil, *Mammals, *Water pollution effects, Toxicity, DDT, Industrial wastes, Ecology, Aquatic animals, Resistance, Pathology, Viruses, Water pollution, On-site investigations, California, On-site data collections, Chromatography, Spectrophotometry.
Identifiers: *Seals, *Sea lions, *Santa Barbara oil spill, *Oil pollution, *Mirounga sp., *Zalophus sp., Crude oil, DDE, Hydrocarbon residues.

Reports of sea lion and elephant seal mortalities caused by the Santa Barbara oil spill were investigated. Several elephant seals with oil on their skin were found, but few appeared ill or distressed. One exception responded well to antibiotics. Autopsy of dead seals and chromatographic and infrared spectrographic tissue analyses failed to indicate hydrocarbon, DDT or DDE residues. Similar tests were made with newly aborted sea lion pups and with one adult sea lion, again with negative results. Serological, histological, bacteriological and virological tests were negative. No correlation existed between the oil spill and the reported mortalities of elephant seals and of sea lions. Supporting references are cited. (LeGore-Washington)

CONTAMINATION OF THE FRESHWATER ECOSYSTEM BY PESTICIDES,
Bureau of Sport Fisheries and Wildlife, Denver, Colo. Fish-Pesticide Research Lab.
Oliver B. Cope.
Summaries in English, French and German. Journal of Applied Ecology, Vol 3 (supplement), p 33-44, Jun 1966. 3 tab, 4 ref.

Descriptors: *Biological communities, *Pesticide residues, *Pesticide removal, *Pesticide drift, *Pesticide kinetics, *Pesticides, *Pesticide toxicity, Ecosystems, Food chains, Water pollution effects, DDT, Chlorinated hydrocarbon pesticides, Fish behavior, 2-4-D, Fish reproduction, Fishkill, Resistance, Growth rates, Fish genetics, Aquatic environment.
Identifiers: *Freshwater ecosystems, *Pesticide pollution, Contamination, Pathologic effects.

The contamination of freshwater ecosystems by pesticides and the subsequent fates of the pesticides are described. The acute effects of pesticides on the flora and fauna are examined, and subacute effects, such as those on behavior, growth, mortality, reproduction, pathology and resistance and genetics, are reviewed. The infinite variety of environmental features of lakes and streams, the multiplicity of chemicals and formulations seen among modern pesticides, and the kinds of effects already noted and measured when pesticides meet plants and animals in freshwater are discussed to emphasize the fact that interactions among these factors can be highly dynamic, productive of manifold effects, and most difficult to predict. (Sjolseth-Washington)
W71-07345

TOXICITY OF ORALLY AND TOPICALLY APPLIED PESTICIDE INGREDIENTS TO CARP, CYPRINUS CARPIO LINNE,
Agricultural Chemicals Inspection Station, Tokyo (Japan); and Institute of Physical and Chemical Research, Tokyo (Japan).
Yasushi Hashimoto, and Jun-ichi Fukami.
Bochu-Kagaku ('Scientific Pest Control'), Vol 34, No 2, p 63-66, 1969. 1 tab, 7 ref.

Descriptors: *Pesticide toxicity, *Mode of action, *Application methods, Pesticides, Carp,

Methodology, Test procedures, Lethal limit, Bioassay, DDT, Chlorinated hydrocarbon pesticides, Organophosphorous pesticides, Herbicides, Fungicides.
Identifiers: *Cyprinus carpio, *Oral application, *Tropical application, Fish gills.

Oral and topical applications of various insecticides, fungicides and herbicides were made on Cyprinus carpio. The LD-50 values for these methods were compared and they were found to differ. In general, the oral application method exhibited lower toxicity than the contact method, expecially with fungicides and herbicides. The site of action of various pesticides in fish was discussed based on the listed LD-50 values. Gill parts are thought to be an important site of action or pathway entrance for some pesticides. Further studies are needed to elucidate the modes of action of pesticides on fish. (Sjolseth-Washington)

SHARK PIT ORGANS: RESPONSE TO CHEMICALS,
Hawaii Univ., Honolulu.
Yasuji Katsuki, Keiji Yanagisawa, Albert L. Tester, and James I. Kendall.
Science, Vol 163, p 405-407, 24 Jan 1969. 2 fig, 6 ref.

Descriptors: *Fish physiology, *Fish behavior, *Sodium chloride, *Ions, Sharks, Calcium, Magnesium, Inhibition, Acids, Ammonium salts, Cesium, Discharge measurement.
Identifiers: *Shark pit organ, *Electrophysiology, *Chemical stimulation, *Mechanical stimulation, Nerve fibers, Canal neuromasts, Response, Nurse sharks, Sugar, Quinine, Potassium, Lithium, Histology.

Nerve fibers from pit organs and canal neuromasts are distinguished by the nature of their electrophysiological response to mechanical and chemical stimulation. Pit organs respond to touch but have a relatively high threshold compared with canal neuromasts. They respond readily to sodium and potassium chloride solutions, the rate of discharge increasing with the concentration of the solution. Order of effectiveness with one molar solutions on monovalent cations is as follows: potassium, rubidium greater than sodium, ammonium greater than cesium, lithium. Anions are ineffective. Divalent cations such as calcium and magnesium are inhibitory. Responses to acid, sugar and quinine are either very slight or inhibitory. (Sjolseth-Washington)

GHOST SHRIMP CONTROL EXPERIMENTS WITH SEVIN, 1960-1968,
Washington State Dept. of Fisheries.
R. E. Westley, Herb Tegelberg, Doug Magoon, Clyde S. Sayce, and John S. Chambers.
Washington State Dept of Fisheries Technical Report No 1, Jan 1970. 61 p, 11 fig, 17 tab, 15 ref.

Descriptors: *Commercial shellfish, *Legal aspects, *Pest control, *Chemcontrol, *Carbamate pesticides, Washington, Shrimp, Oysters, Pesticide toxicity, Pesticide residues, Pesticide removal, Regulation, Tidal waters, Mortality, Persistence, Geologic control, Sediment control.
Identifiers: *Sevin, *Ghost shrimp, *Upogebia sp., *Callianassa sp., Grays Harbor Washington.

The report is a compilation of four papers: Sevin (1-napthyl N-methyl carbamate) treatment of a subtidal oyster bed in Grays Harbor, Washington; the uptake of Sevin by Pacific Oysters and bottom muds; observations on potential uptake of Seven by Pacific Oysters; and, investigation of chemical control of ghost shrimp on oyster grounds 1960-1963. With a 10 lb/acre application of Sevin, its uptake by oysters was low and dropped to background levels within four days of application. Sevin residues in bottom mud disappeared by the 16th day. Sevin in concentrations of 10 lb/acre is an effective agent for controlling ghost shrimp. Based on these reports, the Washington State Department of Fisheries promulgated a regulation to maintain strict control of the use of pesticides on oyster grounds. Under a set of restrictions, Sevin is authorized for use in controlling ghost shrimp. (Sjolseth-Washington)

ISOTOPE BIOLOGY OF C-13. EXTENSIVE INCORPORATION OF HIGHLY ENRICHED C-13 IN THE ALGA CHLORELLA VULGARIS,
Argonne National Lab., Ill. Chemistry Div.
E. Flaumenhaft, R. A. Uphaus, and J. J. Katz.
Biochimica et Biophysica Acta, Vol 215, p 421-429, 1970. 3 fig, 1 tab, 26 ref.

Descriptors: *Cytological studies, *Chlorella, *Radioactive isotopes, *Stable isotopes, Plant morphology, Amino acids, Cultures.
Identifiers: Ribonucleic acid, Chlorella vulgaris.

Previously performed work revealed that a replacement in Chlorella vulgaris of ordinary isotopes of hydrogen, carbon, nitrogen, and oxygen by the heavy, stable H-2, C-13, N-15, and O-18 resulted in drastic cytochemical and morphological changes. In this study, C vulgaris has been grown on C-13 (95% C-13) in H-1 and H-2 media. The cytochemical investigations included cell size distribution, carbohydrates, nucleic and amino acids, and proteins. The abnormalities detected in C-12 - H-2 algae diminished in C-13 - H-2 cultures, indicating that a replacement of isotopes in living organisms may radically modify the simple additive relationship. A clear change in cytoplasmic RNA, expressed in cells thread-like accretions, was observed in C-13 - H-2 and in C-13 - H-1 cultures. (Wilde-Wisconsin)

EFFECTS OF ROTENONE ON ZOOPLANKTON COMMUNITIES AND A STUDY OF THEIR RECOVERY PATTERNS IN TWO MOUNTAIN LAKES IN ALBERTA,
Calgary Univ (Alberta). Canadian Wildlife Service.
R. Stewart Anderson.
Journal Fisheries Research Board of Canada, Vol 27, No 8, 1335-1356, 1970. 7 fig, 4 tab, 50 ref.

Descriptors: *Insecticides, *Rotenone, *Toxicity, *Zooplankton, *Water pollution effects, Biological communities, Fish, Lakes, Mortality, Crustaceans, Succession, Phytoplankton, Rotifers, Resistance, Environmental effects, Diatoms, Larvae, Copepods, Snails.
Identifiers: *Recovery patterns, Side effects, Cladocerans, Jasper National Park (Canada), Community stability, Daphnia galeata mendotae, Gammarus lacustris, Cyclops vernalis, Kellicottia longispina, Keratella cochlearis, Leeches.

Investigation of long-term effects of rotenone on zooplankton communities was undertaken in conjunction with a fisheries management project using rotenone to eradicate undesirable fish. Devastation and recovery of zooplankton communities were studied in relation to application of rotenone to two mountain lakes in Jasper National Park (Canada). Crustacean plankters were absent for about six months after treatment, but rotifers and net phytoplankton were never completely eradicated. All crustacean species, with one exception, reached prerotenone abundance in about three years, probably the minimum time for recovery in these lakes. Recovery is likely related to fecundity, time of reproduction, and the presence of resistant stages. Diaptomus sicilis had not reached reproductive maturity when rotenone was applied, and was the last species to recover to its original numbers. Some species not found in samples before application were found in small numbers afterwards, probably partly due to movement from littoral into limnetic zone. Blooms of small cladocerans after treatment were soon supplanted by increases in large cladoceran numbers. Most variations in composition and abundance after rotenone were likely due to changes in competition and predation pressures rather than to changes in environmental factors or direct effects of rotenone. (Jones-Wisconsin)

A COMPARATIVE STUDY OF CELL THERMOSTABILITY OF MOLLUSKS FROM THE WHITE SEA IN RELATION TO THE VERTICAL DISTRIBUTION OF SPECIES AND THE HISTORY OF FAUNA DEVELOPMENT, (IN RUSSIAN),
Akademiya Nauk SSSR, Vladivostok. Laboratoriya Fiziolozicheskoi Zkolozii.
A. V. Zhirmunskii.
Zhurnal Obshchei Biologii, Vol 30, No 6, p 686-703, 1969. 3 fig, 2 tab, 104 ref.

Descriptors: *Mollusks, *Cytological studies, *Temperature, Biological membranes, Resistance, Ecological distribution, Reproduction, Genetics, Spawning animals.
Identifiers: *Thermostability, *White Sea, *Vertical distribution, Kandalaksha Bay, Boreal species, Arctic species.

This study was concerned with thermostability of oscillating epithelial cells of 12 mollusk species inhabiting the White Sea. A correlation was established between the level of thermostability, vertical distribution of the species, the critical limits of temperature, and the average temperature of spawning. The physiology of organisms reflects the properties acquired by their ancestors in the original habitats. The cell thermostability of arctic species is considerably lower than that of boreal species. ON METHANE OXIDIZING BACTERIA IN FRESH WATERS. I. INTRODUCTION TO THE PROBLEM AND INVESTIGATIONS ON THE PRESENCE OF OBLIGATE METHANE OXIDIZERS,
Max-Planck-Institut fuer Limnologiezu Ploen (West Germany).
M. Naguib, and J. Overbeck.
Zeitschrift fur Allegemeine Mikrobiologie, Vol 11, No 1, p 17-36, 1970. 19 fig, 2 tab, 52 ref.

Descriptors: *Methane bacteria, *Methane, *Bacteria, *Absorption, Anaerobic bacteria, Oxygen, Carbon, Eutrophication, Lakes, Test procedures, Gas chromatography, Oxidation.
Identifiers: *Obligate methane oxidizers, Heterotrophs, Prototrophs, Pink organisms, Methane oxidation, Lake Pluss (West Germany).

Bacterial cultures of presumably methane-oxidizers were obtained from water samples collected from different layers of eutrophic Pluss Lake in Schleswig-Holstein (West Germany). The dynamics of gases was investigated by gas chromatographic analyses. Pure culture of the dominant forms were isolated by means of a micro-manipulator. Incubation of isolated bacteria with methane as the only source of carbon failed to demonstrate the uptake of methane; the organisms proved to be heterotrophs subsiding on conventional organic substrata. No obligate methane oxidizers, such as Pseudomonas methanica, Methylococcus, and Methanomonas methanooxidans, were present in the investigated lake. The authors disagree with claims of prototrophic growth of bacteria with methane as the only source of energy. (Wilde-Wisconsin)

CHROMOSOME BREAKAGE IN HUMANS EXPOSED TO METHYL MERCURY THROUGH FISH CONSUMPTION,
National Inst. of Public Health, Stockholm (Sweden).
Staffan Skerfving, Kerstin Hansson, and Jan Lindsten.
Archives Environmental Health, Vol 21, p 133-139, Aug 1970. 2 fig, 2 tab, 37 ref.

Descriptors: *Water pollution effects, *Chromosomes, Pollutents, Toxins, Animal physiology, Heavy metals, Fish, Toxicity.
Identifiers: *Mercury, Lymphocyte, Chromosome breaks, Phenyl mercury, Methoxyethyl mercury, Alkyl mercury compounds.

Several alkyl mercury compounds, phenyl mercury, and methoxyethyl mercury have been shown to induce chromosome abnormalities in different organisms. Preliminary study shows an increased frequency of chromosome breaks in cells from lymphocyte cultures from nine subjects known to have increased blood levels of mercury. The subjects had eaten contaminated fish at least three times a week for more than five years. Mercury levels in these fish ranged from 1 to 7 p.p.m. Three subjects had not consumed contaminated fish for 5 to 18 months; the others were still exposed. Four healthy subjects were studied as controls. Mercury level in red blood cells was measured for all subjects. The exposed subjects had levels about 2 to 40 times higher than unexposed subjects. There was no statistically significant difference in the frequency of chromosome breaks between the control and the exposed group. However, there was a significant correlation between the frequency of cells with breaks and mercury concentration. The biological significance of these findings is not known. (Mortland-Battelle)

A POLYCHLORINATED BIPHENYL (AROCLOR 1254) IN THE WATER, SEDIMENT, AND BIOTA OF ESCAMBIA BAY, FLORIDA,
Bureau of Commercial Fisheries, Gulf Breeze, Fla. Center for Estuarine and Menhaden Research.
T. W. Duke, J. I. Lowe, and A. J. Wilson, Jr.
Bulletin of Environmental Contamination and Toxicology, Vol 5, No 2, p 171-180, Mar-Apr 1970. 2 fig, 3 tab, 7 ref.

Descriptors: *Water pollution effects, *Bioassay, *Toxicity, *Chlorinated hydrocarbons, *Bioindicators, Industrial wastes, Florida, Sessile algae, Estuaries, Chemical wastes, Gas chromatography, Sediments, Oysters, Shrimp, Crabs, Water pollution sources, Sea water, Trout, Toxins.
Identifiers: *Polychlorinated biphenyls, Aroclor 1254, Escambia River, Pinfish, Flounder, Croaker, Menhaden.

Aroclor 1254, a polychlorinated biphenyl, has been detected in the biota, sediment, and water of estuarine areas near Pensacola, Florida. Only one source of the chemical, an industrial plant on the Escambia River, has been found. Water, sediment, and fish, crab, oyster, and shrimp samples were collected from April through October 1969 and analyzed using gas chromatography procedures. In addition, bioassays on fish, shrimp, and oysters were conducted under controlled laboratory conditions to determine the toxic effects of Aroclor 1254. These studies showed that juvenile shrimp were the most sensitive and were killed when exposed to 5.0 ppb of Aroclor 1254 in flowing sea water. The Aroclor content in water from Escambia Bay, even near the mouth of the river, was less than 1 ppb. Shrimp collected from the bay contained a maximum of 2.5 p.p.m. Thus, shrimp in the bay probably were not exposed to lethal levels during the sampling period. Highest concentrations in the water occurred during August and decreased when leakage from the plant was corrected. (Mortland-Battelle)

POLYCHLORINATED BIPHENYL: INTERACTION WITH DUCK HEPATITUS VIRUS,
Wisconsin Univ., Madison. Dept. of Veterinary Science.
Milton Friend, and Daniel O. Trainer.
Science, Vol 170, No 3964, p 1314-1316, Dec 18, 1970. 1 fig, 2 tab, 8 ref.

Descriptors: *Mallard duck, DDT, Mortality, Viruses, Toxicity.
Identifiers: *Polychlorinated biphenyl, *Hepatitis virus, Aroclor 1254.

As part of an investigation of possible interactions between organochlorine pollutants and infectious diseases, this study was initiated to determine whether any interaction, antagonistic or synergistic, occurs with PCB and duck hepatitis virus (DHV) in mallards. Ten-day-old mallard ducklings fed a polychlorinated biphenyl at concentrations of 25, 50, and 100 parts per million for 10 days suffered no apparent clinical intoxication. Five days later these birds were challenged with duck hepatitis virus, and they suffered significantly higher mortality than birds which were not exposed to the polychlorinated biphenyl. The study illustrates one of the potential effects of sublethal concentrations of chemical pollutants. (McCann-Battelle)

THERMAL DISCHARGE FROM NUCLEAR PLANTS AND RELATED WEATHER MODIFICATION,
State Univ. of New York, Albany. Atmospheric Sciences Research Center.
Ronald Stewart.
Proceedings of Twelfth Conference on Great Lakes Research, University of Michigan, p 488-491, May 5-7. 2 tab, 6 ref.

Descriptors: *Thermal pollution, *Nuclear powerplants, Temperature, Humidity, Fog, *Weather modification, *Benificial use, Water pollution effects.
Identifiers: Thermal discharge.

The volume of thermal discharge from power plants is increasing at a rate which suggests that the discharge will cause inadvertent weather modification. A 1000 MW nuclear powerplant uses approximately one million gallons per minute of which 10,000 gallons evaporate. This is sufficient to reduce visibility and increase fogging in the area under suitable atmospheric conditions. Beneficial uses of thermal discharge are suggested and calculations are presented to indicate that waste heat released by a dry closed circuit cooling system is sufficient to dissipate fog and increase visibility. (Upadhyaya-Vanderbilt)

THERMAL INVESTIGATIONS IN CALIFORNIA,
Pacific Gas and Electric Co., Emeryville, Calif.

James R. Adams.
Marine Pollution Bulletin, Vol 1 (NS), No 9, p 140-142, Sept 1970.

Descriptors: *Thermal pollution, *California, *Estuaries, Temperature, Ecology, Thermal powerplants, Mapping, Isotherms, Fish, Aquatic life, Water quality, Aquatic habitats, Pacific Coast Region, Tidal powerplants, Water pollution effects.
Identifiers: *Thermal tolerance.

In California 22 power stations with a total capacity of 16,824 MW discharge into tidal areas. Research into thermal tolerance of fish and other aquatic organisms to cooling water was conducted in order to provide necessary information for evaluation of ecological impact. The investigations made in several locations (San Francisco Bay Delta, Monterey Bay) are described and a summary of results discussed. The prediction of ecological impact for one location (Diablo Nuclear Plant), was verified and it was found that the marine community had definitely responded to the discharge but had returned to an essentially normal complement of warm water and cold water forms within 230 m of the discharge. (Novotny-Vanderbilt)

MERCURY: NO NEED FOR HYSTERIA.

Life, Vol 70, No 3, p 32-33, Jan 29, 1971.

Descriptors: *Metals, *Aquatic life, *Food chains, Limiting factors, Water pollution effects.
Identifiers: *Mercury pollution, *Mercury poisoning, Methylmercury, Tuna, Swordfish.

This article is aimed at describing, in broad terms, the mercury pollution problem, its origin, pathways of mercury, potential hazard to human beings and necessary, as well as unnecessary, precautions. Swordfish and tuna may have high amounts of mercury because they are both wide ranging predators, at the top of long food chains. In the body of water containing 0.00001 ppm of mercury, the fish might contain 10 ppm. Symptoms and a brief history of mercury poisoning is given. The Food and Drug Administration limit of 0.5 ppm maximum permissible concentration in food is quoted, however, the Food and Drug Administration cannot state that all mercury residue in fish below this guideline is safe, as well as that all mercury above 0.5 ppm is unsafe. (Oleszkiewicz-Vanderbilt)

IMPACT OF WASTE HEAT ON AQUATIC ECOLOGY,
Cornell Univ., Ithaca, N.Y. Dept. of Conservation.
Clarence A. Carlson.
Proceedings of the Symposium, 'Our Generation and Environmental Changes', American Association of Advancement Sciences Meeting, 1969. 9 p, 10 ref.

Descriptors: *Temperature effects, *Thermal pollution, *Ecology, *Thermal powerplants, Cooling water, *Aquatic population, Temperature, Streams, Water pollution effects.

The impact of increasing electric power production connected with increasing discharges of waste heat in streams from the standpoint of ecology and water quality represents a serious problem. The temperature is important to aquatic organisms as a lethal, directive, and controlling factor. Five major effects of heat pollution on higher aquatic organisms are listed. The importance of water quality and temperature standards are listed. The importance of water quality and temperature standards ought to be stressed. In addition to standards, there is a great need for more research on the response of various aquatic organisms to temperature. Several possible means to control water temperature (cooling tower, etc.) are discussed. (Novotny-Vanderbilt)

ECOLOGICAL IMPACT OF NUCLEAR-FUELED POWER PLANTS,
Cornell Univ., Ithaca, N.Y. Dept. of Conservation.
Clarence A. Carlson.
In: Extension Series, Cornell University, Ithaca, New York, Department of Natural Resources, (1970). 33 ref.

Descriptors: *Temperature effects, *Thermal pollution, Ecology, *Nuclear powerplants, *Cooling water, Radioactive wastes, Fish, Aquatic population, Temperature, Streams, Lakes, Estuaries, Water pollution effects.

Nuclear powerplants require water for cooling their condensers and such plants have a capacity to discharge water that is warmer and more radioactive than the entering water. The discharged heat may be harmful to aquatic organisms. Five major effects of heat pollution are listed in this paper. Proper thermal standards should be developed. The biological effects of radiation are classified as somatic and genetic effects. The radionuclide concentration in aquatic and marine organisms is discussed. The major weakness of radiological standards is that they are designed to protect humans but not to protect aquatic life. Information on responses of aquatic organisms to radiation seems to be inadequate, more research work is necessary. (Novotny-Vanderbilt)

THERMAL POLLUTION-A CAUSE FOR CONCERN,
Virginia Polytechnic Inst., Blacksburg. Coll. of Arts and Sciences.
John Cairns, Jr.
Journal Water Pollution Control Federation, Vol 43, No 1, p 55-66, Jan 1971. 18 ref.

Descriptors: *Thermal pollution, *Environmental effects, *Ecosystems, Electric power industry, Conservation, Thermal stress, Heat, Speciation, Acclimatization, Biota, Water pollution effects.
Identifiers: Thermal tolerance.

The paper is a general discussion of thermal pollution. Its causes, its relationship to the water balance of this nation, and its effects on organisms in lakes, rivers, streams, and estuaries are reviewed. Technological advances cause stresses on the natural environment. Organisms are limited in their responses to changes. Nontolerant species are excluded, and resistent species replace them. Illustrations of the effects of thermal pollution are presented. The concept that this planet's ability to support life and its ability to transform wastes into acceptable or useful materials is discussed. Developing a balanced life-support system that serves the greatest variety of beneficial uses will not be possible unless man abandons narrow discipline-oriented, single-purpose views toward environmental management and use. THE CANADIAN APPROACH TO ACCEPTABLE DAILY INTAKES OF MERCURY IN FOODS,
Department of National Health and Welfare, Ottawa (Ontario).
A. B. Morrison.
Meeting Paper, Symposium on 'Mercury and Man's Environment', Feb 15 and 16, 1971. Royal Society of Canada, Ottawa.

Descriptors: *Heavy metals, *Human pathology, *Foods, Toxicity, Fish, Environmental engineering, Water pollution effects, Diseases, Epidemiology, Lethal limit, Public health, Animal pathology.
Identifiers: *Mercury, *Mercury pollution, Acceptable daily intakes.

Studies and results on acceptable daily intakes are presented. Acceptable daily intake is obtained by applying a 10-fold safety factor for inter-species variations, and a further 10-fold safety factor for intra-species variations. The acceptable daily intake for man is thus 1/100 of the no-effect level in the most sensitive animal species tested. From the knowledge of the acceptable daily intake, the maximum permissible level (M.P.L.) is obtained. In Canada the limit of 0.5 ppm of mercury in fish on a wet weight basis was adopted and a guideline proposed. The allowable intakes rates are discussed. The lowest whole-blood concentration of mercury associated with toxic symptoms (0.2 mcg/gram) was considered to represent a daily intake of 0.3 mg of methylmercury for 70-kg man. From this computation, it was concluded that the margin of safety in fish contamination as a food for man is very low. But, the program has shown that mercury levels in the total human diet are extremely low. (Novotny-Vanderbilt)

MERCURY IN THE ENVIRONMENT: NATURAL AND HUMAN FACTORS,
Allen L. Hammond.
Science, Vol 171, No 3973, p 788-789, Feb 26, 1971.

Descriptors: *Fish, *Environment, *Toxicity, Standards, Water pollution effects.
Identifiers: *Mercury, Concentration, Health effects.

Metallic mercury and inorganic mercury usually attack the liver and kidney and have a short half-life whereas methyl mercury and other alkyl mercury compounds attack the central nervous system and have a half-life of about 70 days. Symptoms of methyl mercury poisoning in man may include loss of vision, hearing, coordination, and intellectual ability. The lowest concentration in the blood which is reported to cause identifiable symptoms is 0.2 ppm. The oceans contain approximately 1.3 10 to the 18th power metric ton of water with average concentration of mercury close to 0.1 ppb. This amounts to 10 to the 8th power metric tons of mercury whereas total mercury from man's activities amounts to less than 10 to the 4th power metric tons per year. Methylation seems to proceed more efficiently in aerobic systems than in anaerobic systems. (Upadhyaya-Vanderbilt)

AQUATIC ECOSYSTEMS AND THERMAL POWER PLANTS,
Johns Hopkins Univ., Baltimore, Md. Dept. of Geography and Environmental Engineering
Loren D. Jensen, and Derek K. Brady.
Journal of the Power Division, Proceedings of American Society of Civil Engineers, Vol 97, No PO1, Proc Paper 7802, p 209-217, Jan 1971.

Descriptors: *Thermal pollution, *Cooling water, *Thermal powerplants, Water pollution effects, *Sites.
Identifiers: *Aquatic ecosystems, *Thermobiology, Temperature criteria, Biological zones.

The factors which affect biological responses to temperature changes in aquatic ecosystems are discussed in terms of their influence on siting, design and operation of thermal power plants. Recommended are: (1) the development of a basis for classifying aquatic organisms according to their relative importance in maintaining the balance of specific ecosystems, (2) the biological zoning of receiving waters, with time-dependent temperature criteria based on the annual reproduction cycles of ecologically important species; (3) the development of criteria which incorporate the effects of temperature rise, duration of exposure, rate of change, and frequency of violation; (4) the field investigation of planktonic entrainment in cooling water intakes to evaluate the effects of temperature, turbulence and recirculation; (5) a flexible approach to the design of cooling water systems so as to facilitate subsequent modifications and additions, and (6) the incorporation into plant operational procedures of careful control of rates of load change. (Oleszkiewicz-Vanderbilt)

here has been concern recently of the possibility f long-term disturbances of our environmental cology by hexavalent chromium discharged in in-ustrial and, in some cases, naval waste waters. To d in the assessment of these potential dangers, the terature was surveyed to provide a perspective verview of the toxicities of hexavalent chromium oward plant and animal. The means available for educing chromate concentrations in waste waters ppm levels were reviewed for suitability for Navy sage. The techniques considered were chemical duction, with subsequent precipitation of the ivalent chromium product; ion exchange; direct recipitation; ion flotation; electrochemical reduc-on; and electrodialysis. Background and orienta-onal information are furnished for use in con-dering Navy chromate pollution problems and eir rectification.

HE EFFECTS OF URBAN DRAINAGE ON AKE McILWAINE, RHODESIA,
McKendrick, and R. K. Williams.
ater Pollution Control, Vol 68, p 523-528, 1969.

escriptors: *Water quality, Water treatment, Ef-ients, Investigations, Water pollution sources. entifiers: *Rhodesia, *Urban runoff, Algal owth, *Lake McIlwaine.

om 1953 to 1959 there was little change in the uality of the water in lake McIlwaine, which is the ain source of supply for Salisbury, Rhodesia, but m 1960 trouble began to be experienced with avy algal growths which interfered with treat-ent of the water. When the lake water intake level s lowered to avoid the algae, problems were used by manganese and iron in the lower waters the lake. Studies on conditions in the lake owed that the algal growths were caused by high ncentrations of phosphate and nitrogen brought o the lake by the rivers to which the effluents m the city's sewage works and oxidation lagoons re discharged; algal growths were most severe ring periods of low rainfall when less dilution was ailable.

RINKING OF SULFATE-WATER BY CATTLE,
vada Univ., Reno.
J. Weeth, and J. E. Hunter.
urnal Paper No 168. Journal of Animal Science, l 32, No 2, p 277-281, 1971. 1 tab, 39 ref. West g Research Project W-46.

scriptors: *Sulfates, *Sodium chloride, Farm stes, Cattle, Toxicity, Water, Growth rates, ater pollution effects.
ntifiers: *Drinking water, Sulfate water, moglobin.

is study was designed to characterize some of the ects on cattle of drinking water contaminated h a known concentration of sulfate. Nine-grow-Hereford heifers were offered as drinking water ner tap-water, 5,000 ppm Na sub 2 SO sub 4-ter or 4,110 ppm NaCl-water. The experimental ign was a 3x3 latin square with replicates. Ex-imental periods were 30 days. Total urine was lected on the last 7 days with renal clearance ob-servations being made on the sixth day. The season was summer. The heifers drank less, ate less and lost weight while consuming the sulfate-water. The sulfate ion caused a relative diuresis. Percent urine water of free-water intake was 33.8 with sulfate-water, but only 22.1% with tap water. Total hemoglobin concentration was unaffected by the saline drinking waters, however, the sulfate-water caused a 450% increase in methemoglobin concentration and the development of 416.9 mg/100 ml of sulfhemoglobin. The two nonfunctional hemoglobins comprise 6.2% of total hemoglobin at this time. Drinking the sulfate-water increased serum sulfate concentration 63.1%, increased renal filtration of sulfate 45.2%, but decreased renal reabsorption of sulfate by 27.5%. Drinking sulfate-water did not alter plasma calcium concentration or renal excretion of calcium. A specific toxic effect of drinking the Na sub 2 SO sub 4-water was not apparent, however, the adverse effects seen were related to the sulfate ion. Only a slight polyposia and diuresis were observed with drinking of the NaCl-water. (Christenbury-Iowa State)

WATER CONFLICTS ON LAKE ERIE,
Pennsylvania Dept. of Health, Harrisburg, Pa.
Walter Lyon.
In: Great Lakes Water Resources Conference, Toronto, Hydro-Electric Power Commission of Toronto, p 115-120, 1968.

Descriptors: *Water quality, *Management, *Pollution, *Lake Erie, *Regional analysis, Fisheries, Recreation, Population, Lakes, Streams, Mathematical studies, Costs, Social aspects, Industrial wastes.
Identifiers: *Economic objectives, *Regional economy, *Pollution abatement, Trapped segments, Public policy.

Attempts are made to clarify the facts about the condition of Lake Erie in order to offset the adverse economic effect of reports that Lake Erie is 'dead' and a polluted health hazard. Lake Erie is 'sick' rather than 'dead', having suffered serious injury because many of its uses have been abused by economic objectives which failed to relate the regional economy to the protection of the lake as a natural resource. Some of the lake's problems which are specified include the ecological imbalance of overfertilization by phosphates, the change in the species composition of fish, and the accumulation of residual pollutants from treated sewage and industrial waste discharges. Three steps are proposed to improve the water quality of the lake, namely implementation of the pollution abatement program, improvement of fisheries, and development of a conceptual policy framework based on a model of the lake which considers ecologic, hydrologic, and biochemical and other subsystems operative in the lake and which would relate pollution abatement to resultant water quality and use improvements. THERMAL EFFECTS STUDIES BY NUCLEAR POWER PLANT LICENSEES AND APPLICANTS.
Atomic Energy Commission, New York.

For sale by the Superintendent of Documents, US Government Printing Office, Washington, DC, 20402, Price $3.50. Hearing before the Joint Committee on Atomic Energy, Congress of the United States, on Environmental Effects of Producing Electric Power, Part 2, Vol 2, p 2233-2315, Jan 27-30, Feb 24-26, 1970.

Descriptors: *Thermal pollution, *Nuclear powerplants, Costs, Condensers, Sites, Temperature, Nuclear reactors, Water pollution effects.
Identifiers: Cooling source, Environmental research.

During 1969, the Atomic Energy Commission Director of Regulation conducted a survey of Atomic Energy Commission nuclear powerplant licensees and studies they had undertaken or planned concerning effects of the discharge of heated condenser cooling water from their plants on aquatic environments. This report consists of brief summaries of the information furnished by 43 respondents. The survey showed that a variety of measures are being taken by many utilities to minimize potential thermal effects of their plants and meet state water quality standards. These methods include cooling towers, cooling ponds, subsurface discharge devices, multiport diffusers, deep water intakes, canals several miles long, and large capacity pumps to increase flow rate during the summer. (Upadhyaya-Vanderbilt)

ENVIRONMENTAL EFFECTS OF CONDENSER WATER DISCHARGE IN SOUTHWEST LAKE MICHIGAN,
BIO-TEST Labs., Inc., Northbrook, Ill.
Lawrence P. Beer.
Proceedings of Twelfth Conference on Great Lakes Research, Michigan University, Ann Arbor, Michigan, p 504-512, May 5-7, 1969. 3 fig, 8 tab, 2 ref.

Descriptors: *Thermal pollution, *Lake Michigan, *Temperature, Dissolved oxygen, Isotherms, *Cooling water, Sport fish, Plankton, Stratification, Water pollution effects, Great Lakes.
Identifiers: Heat dissipation.

A study of heat dissipation rates and patterns, bottom and lake organisms, and chemistry of lake waters was made at the outfall of Commonwealth Edison Company's Waukegan generating station. Heat input from the 760,000 gpm flow with a condenser water rise of 12F, is dissipated 3200 ft. offshore. At only 1500 ft. offshore, heat is dissipated to within 2-3F of ambient. Condenser water mixes with lake water in shallow depths near shore and floats on the surface of deeper cooler water. Dissolved oxygen remained unchanged in the offshore area at near saturation levels of 11.0 to 11.5 mg per liter. Benthic or bottom-living organisms vital to the food chain of commercial and sport fish have not been eliminated by discharge from the station. Plankton counts do not indicate any definite effect from the heated discharge. Sport fish, including trout and coho salmon which frequent the water near the discharge, have not apparently suffered any deleterious effect. The study took place in three days in April. (Upadhyaya-Vanderbilt)

POLLUTION OF LAKE ERIE, LAKE ONTARIO AND THE INTERNATIONAL SECTION OF THE ST. LAWRENCE RIVER.
Technical Advisory Board on Air Pollution, International Joint Commission (Canada).

Report by the International Joint Commission Canada and United States, 1970. 174 p, 5 fig, 4 tab.

Descriptors: *Water pollution sources, *Water pollution effects, *Pollutants, *Monitoring, *Legal aspects, Lake Erie, Lake Ontario, St. Lawrence River.
Identifiers: *Potential, Remedial measures, Proposed objectives.

The International Joint Commission reports on an inquiry into the pollution of Lake Erie, Lake Ontario and the International Section of the St. Lawrence River. The locations, causes and extent of pollution were studied. Recommendations for water quality objectives were made in the hopes

that both Canada and the United States would adopt them and enter into agreement on programs and measures to achieve those objectives. Authority by the Commission to monitor the water quality and abatement progress was recommended. The IJC also recommended that the reference of October 1964 be extended to authorize pollution studies in the remaining boundary waters of the Great Lakes and tributary waters. (Ensign-PAI)

A DISSOLVED OXYGEN PRECICTION MODEL FOR A LONG RIVER,
Wisconsin Univ., Madison. Water Resources Center.
Charles H. Falkner.
Technical Report. Preliminary, 1969. 29 p, 12 fig, 21 ref. OWRR Contract C-1228.

Descriptors: *Dissolved oxygen, *River systems, *Biodegradation, Municipal wastes, Industrial wastes, Flow, Temperature.
Identifiers: Deoxygenation, Reoxygenation, Models.

A model was presented for predicting the effects of the deoxygenation-reoxygenation process in a long complex river system resulting from the discharge of biodegradation wastes by municipalities and industries. The model estimated the dissolved oxygen (DO) profile as a function of flow and temperature. The variational effects of flow, temperature and other river parameters were approximated by step functions. The river was divided into subreaches. The approach was essentially a steady state approximation of a dynamic system. The problems and results of applying the model to a 180-mile reach of the Wisconsin River were presented. EXISTING AND POTENTIAL PROBLEMS OF EXCESSIVE EUTROPHICATION IN THE TENNESSEE VALLEY,
Tennessee Valley Authority, Chattanooga. Water Quality Branch.
Eugene B. Welch.
Proceedings of the 7th Annual Sanitary and Water Resources Engineering Conference, Vanderbilt University, Nashville, Tennessee, p 45-73, 1968. 7 fig, 8 ref.

Descriptors: *Eutrophication, *Tennessee Valley Authority Project, *Reservoirs, Temperature, Dissolved oxygen, Density, Rooted aquatic plants, Algae, Chlorophyll, Hypolimnion, Phosphorus, Nitrogen, Phytoplankton, Productivity, Turbidity, Surfaces, Depth, Distribution, Time, Epilimnion, Thermocline, Light penetration, Standing crop, Industrial wastes, Rainfall, Alabama.
Identifiers: Cherokee Reservoir (Tenn), Holston River (Tenn), Potomogeton pectinatus, Potomogeton crispus, Heteramthera, Pickwick Reservoir (Tenn), Najas, Photic zone, Douglas Reservoir (Tenn), Norris Reservoir (Tenn), French Broad River (Tenn), Chickamauga Reservoir (Tenn), Florence (Ala).

Pattern of hypolimnetic oxygen depletion in three TVA system reservoirs appears related to phytoplankton productivity, which is affected by several environmental factors. In reservoirs studied, nutrient (nitrogen and phosphorus) content potential limits production only during intense summer stratification. Thermal stratification affecting nutrient distribution and light availability, turbidity affecting light penetration, and water detention time may at various periods and places control production regardless of nutrient content. Field and laboratory evidence shows that growth of two nuisance macrophytes in Tennessee Valley is probably not controlled by nitrogen and phosphorus content of water. Nutrient requirements are apparently less than amounts measured and available. Organic sediment is relatively more important as nutrition sources for maximum growth than surrounding water. Amount of available light at least partly explains annual and seasonal variability in nuisance macrophyte growth. Light reaching stream or lake bottom and available for plant growth during growing season from year to year is affected by interaction of incident light, water depth, and turbidity or relative penetration. These, or related factors, were most favorable during the two years when nuisance macrophyte problems were greatest in Pickwick Reservoir, and were related to plant growth in Holston River during 1967. 5D. Waste Treatment Processes

ACTIVATED SLUDGE TREATMENT OF TEXTILE AND DYEING MILLS WASTE,
M. Kashiwaya.
Proceedings of the 2nd International Conference on Water Pollution Research, Tokyo, Vol 2, p 63-84, 1965.

Descriptors: *Activated sludge, *Sludge treatment, Waste water treatment.
Identifiers: *Dyeing, *Finishing process (General), *Contact-stabilization, *Textile mill wastes, Dyehouse wastes.

In the region of Ichinomiya, Besai, and Kisogawa, Aichi Prefecture, Japan, waste waters from 129 factories processing, dyeing, and finishing textiles have caused serious pollution of the Nikko River and many irrigation channels. After discussing the sources and characteristics of these waste waters, the author reports pilot-scale studies, with tabulated and graphical results, which showed that the waste waters could be treated effectively by either a conventional activated-sludge or a contact-stabilization process. EFFECT OF SURFACE GROUPS ON ADSORPTION OF POLLUTANTS,
Lehigh Univ., Bethlehem, Pa. Dept. of Chemical Engineering.
Robert W. Coughlin.
Copy available from GPO, Sup Doc as SOD order No EP2.10:17020-06/70, $0.40; microfiche from NTIS as PB-198 519, $0.95. Water Pollution Control Research Series, Program No 17020--06/70. 29 p, 14 fig, 1 tab, 13 ref. FWQA Grant No WP-00969-01.

Descriptors: *Activated carbon, *Adsorption, *Organic compounds, Kinetics, Isotherms, Separation techniques, Solvents, Solutes, Oxidation, Mixing, Temperature, Phenols, Tertiary treatment, Waste water treatment, *Oxides.
Identifiers: *Acidic surface oxides, Specific surface area, Graphite, Regeneration.

Free valences at the edge of the graphitic layers of microcystalline carbon cause the layer edges to be very reactive, and to form surface oxides. Acidic surface oxides are commonly formed under normal operating conditions of activated carbon systems. These oxides were studied to determine their effect on the adsorptive capacity of the activated carbon. Acidic surface oxides reduce both the adsorptive capacity, and the rate of adsorption for most pollutants, such as phenol, nitrobenzene, sodium benzene sulfonate, and dextrose. The sorptive capacity and speed of sorption of urea, however, was markedly increased. It was also discovered that the changes brought about by acidic surface oxide layers were reversible. Removal of the oxide restored the carbon to its original capacity and sometimes beyond. Results of this study indicated that the effects of acidic surface oxides depend upon: (1) type of organic pollutant being sorbed and (2) relative strength of surface oxide interactions with both the water solvent and the solute to be adsorbed. 2ND INTERNATIONAL SYMPOSIUM FOR WASTE TREATMENT LAGOONS.

Sponsored by Missouri Basin Engineering Health Council, and Federal Water Quality Administration. Edited and distributed by Ross E. McKinney, 217 Nuclear Reactor Center, University of Kansas, Lawrence, Kansas 66044. June 23-25, 1970, Kansas City, Missouri. 404 p.

Descriptors: *Oxidation lagoons, *Waste water treatment, Performance, Efficiencies, Climatic conditions, Cost analysis, *Industrial wastes, *Domestic wastes, *Lagoons.
Identifiers: Aerated lagoons, Aerobic lagoons, Anaerobic lagoons, Facultative lagoons, Applications.

Lagoons - aerobic, anaerobic, facultative, and aerated - are discussed both as to their past history and also to their future applications. Lagooning has been applied to nearly all types of wastes both domestic and industrial with success. The main reasons for this universal application are: (1) low initial cost as long as land values are reasonable, (2) minimum maintenance expenses; and (3) long system working life. The basic design considerations for the construction of lagoons are: (1) area BOD loading; (2) temperature; (3) nature of organics present; (4) climatic conditions both as to temperature and rainfall; and (5) condition of the soil upon which the lagoons are to be built. Papers presented at the symposium cover the full range of opinions, from both proponents and opponents. Design criteria are presented for nearly every type of system configuration imaginable. The underlying theme, however, has been one of recognition of the need for more detailed and complete experimental and investigation to more fully define lagoon performance and operation. WASTE WATER TREATMENT AND WATER POLLUTION IN THE UNITED STATES,
Federal Water Quality Administration, Washington, D.C. Water Quality and Research.
Rienhold W. Thieme.
In: 2nd International Symposium for Waste Treatment Lagoons, June 23-25, 1970, Kansas City, Missouri, p 4-7.

Descriptors: *Waste water treatment, *Population, Water resources development, River basin commissions, Cost sharing, Government finance, Erosion control, Sedimentation, Farm wastes, M

icipal wastes, Industrial wastes, Planning, Re-ions, *Water pollution treatment.
dentifiers: *Regional planning, Federal financing, Municipal bonds, Combined sewers, Air flotation, Screening.

The population explosion is making it more and more imperative for the United States to require a greater degree of treatment of waste products from all areas. As the population grows, the water supply stays constant. Therefore, none of it can be wasted by polluting it. The government has started the movement toward cleaner water by helping state and local agencies with the financing and the technical problems involved in building a waste treatment facility. The preoccupation with the present has given way in many instances to a much more realistic view of long range future planning. The regional basin plans help to assure that money spent in one area will not be wasted. Only by turning her vast technology and manpower to the areas of natural conservation and pollution control will the United States be able to stave off disaster and famine in the coming decades. The old line policies of exploiting natural resources in such a manner as to yield the largest profit must give way to the new era of judicious management of the dwindling resources that are left. HE ROLE OF PONDS IN WASTE WATER REATMENT,
outh Dakota Dept. of Health. Div. of Sanitary En-neering.
. O. Allum, and C. E. Carl.
: 2nd International Symposium for Waste Treat-ent Lagoons, June 23-25, 1970, Kansas City, Mis-uri, p 7-10. 11 ref.

escriptors: *Ponds, *Waste water treatment, Or-anic loading, Maintenance, Dissolved oxygen, dor, Anaerobic conditions, Aerobic conditions, ost analysis, Municipal wastes, Industrial wastes, South Dakota.
dentifiers: Real estate values, Polishing.

Man made ponds designed for waste treatment ave a wide variety of application to a wide range f wastes. South Dakota has state regulations overning the loading on such ponds, but little her care or maintenance is required at these in-allations. Pond sizes range from about .08 acres 284 acres, and provide efficient treatment for mmunities whether they are overnight camp rounds, or cities of 10 to 15,000 population. onds have also been used for many industrial aste problems. Slaughter house wastes, food rocessing wastes, sugar beet processing wastes, henols, and many other different industrial scharges have been successfully treated in ponds. eriodic inspection and repair of the dikes is vir-ally the only required maintenance. The cost of onds is almost totally dependent upon land costs, nd is therefore particularly suited to South akota's comparatively inexpensive land situation. he only serious drawback of ponds is their spring lor problems. These problems also occur during verloading, even though overall treatment may ill be quite good. (See also W71-07079) (Lowry-exas)

DECADE OF CHANGE IN WASTE STA-ILIZATION LAGOONS IN THE MISSOURI IVER BASIN,
orth Dakota State Dept. of Health. Environmen-l Health and Engineering Services.
. Van Heuvelen.
nd International Symposium for Waste Treatment agoons, June 23-25, 1970, Kansas City, Missouri, 10-13.

escriptors: *Oxidation lagoons, *Waste water eatment, Odor, Seepage, Maintenance, Organic ading, Coliforms, Municipal wastes, Industrial astes, Anaerobic conditions, Aerobic conditions, issouri River.
Identifiers: *Aerated lagoons, Land values, *Missouri River basin.

Prior to 1950, the use of lagoons for waste treatment was generally discouraged in the United States. Between 1950 and 1960 increased interest in the design and operation of lagoons became evident. In 1960, there were 469 lagoons in the Missouri River Basin, and in 1970, there were 1,749. Each individual state usually has control over the critical design parameters. Much variation has been observed with respect to area and loading rates, depth, bottom and seepage control, location, multiple unit installation, etc. Benefits accruing to the states and municipalities from the use of lagoons include low initial cost, little or no maintenance, no problems with shock loading, no need for highly skilled operators and storage capacity sufficient to hold waste until desired time of discharge. Lagoons have aided many municipalities to treat effluents that otherwise would have remained untreated. Their usage is still on the increase and will probably remain so as long as land values permit them to be economically constructed. (See also W71-07079) (Lowry-Texas)
W71-07082

THE ROLE OF OXIDATION PONDS IN IMPROVING ENVIRONMENTAL HEALTH IN DEVELOPING COUNTRIES,
World Health Organization, Geneva (Switzerland).
P. A. Stevens.
2nd International Symposium for Waste Treatment Lagoons, June 23-25, 1970, Kansas City, Missouri, p 13-15. 1 tab.

Descriptors: *Oxidation lagoons, *Environmental sanitation, Population, Economic feasibility, Vectors (Biology), Snails, Sewage systems, Waste water treatment, Fertilization, Evaporation.
Identifiers: *Underdeveloped nations, Hygiene, Disease transmission, Flies.

Less than 10% of the population of most developing countries had piped water in their houses by 1962, and only a fraction of these had sewers. What sewers were available were constructed mainly to transport wastes back onto the land for irrigation. Oxidation ponds provide an economical solution for areas of this nature, but in addition to the usual construction and maintenance problems, engineers often have an acceptance problem also. Before any treatment facility can be built the population to be so serviced must want it. In many instances this is not the case. Add to this the fact that in arid areas, evaporation from the top of the pools allows precious water to be lost, waste stabilization removes nutrients from the peasant's only source of fertilizer, and the treatment of wastes becomes an economic disadvantage. At present, many countries are using waste stabilization ponds, and all reports indicate that they are economically and technically feasible. However, the overall needs, demands, and customs of a particular area must be accounted for before such a facility can be a success. (See also W71-07079) (Lowry-Texas)

DYNAMIC BEHAVIOUR OF OXIDATION PONDS,
Cape Town Univ. (South Africa).
G. v. R. Marais.
2nd International Symposium for Waste Treatment Lagoons, June 23-25, 1970, Kansas City, Missouri, p 15-46. 28 fig, 14 ref, append.

Descriptors: *Oxidation lagoons, *Mathematical models, *Computer simulation, Mixing, Turbulence, Temperature, Stratification, Solar radiation, Algae, Photosynthesis, Anaerobic conditions, Aerobic conditions, Sludge, Waste water treatment, Biodegradation, Biochemical oxygen demand.

A computer model of oxidation ponds stimulated interest in several parameters which were not previously considered to be important. Data was collected from the Maters North Pond in Lusaka, Zambia, and then analyzed and used to develop the computer model. This model clearly demonstrated that (1) mixing in the pond demands much greater attention as an influential parameter with respect to both the theoretical and the practical aspects, (2) advent of anaerobic conditions in aerobic oxidation ponds is a much more complex phenomenon than was previously supposed, being dependent upon temperature, mixing, algal growth and BOD in the pond, and possibly other parameters, (3) the sludge layer occupies an important position in the degradation process and directs attention to the benefits in partial separation by anaerobic pretreatment. (See also W71-07079) (Lowry-Texas)

DEVELOPMENT OF LAGOON DESIGN STANDARDS IN UTAH,
Utah Water Pollution Committee, Salt Lake City.
Calvin K. Sudweeks.
2nd International Symposium for Waste Treatment Lagoons, June 23-25, 1970, Kansas City, Missouri, p 46-54. 3 tab.

Descriptors: *Oxidation lagoons, *Design standards, *Waste water treatment, Municipal wastes, Organic loading, Mixing, Temperature, Precipitation, Permeability, Seepage, Groundwater, Sulfates, Coliforms, Chlorination, Biochemical oxygen demand, *Utah.
Identifiers: Logan (Utah).

The stream conditions in Utah are such that in many areas, the effluent from a waste treatment facility may be most, or in some cases, all of the total flow of the stream for much of the year. Because of this, the water quality standards of that state must be extremely stringent. As lagooning became more popular as a waste treatment device, appropriate controls were needed, but there was no information readily available concerning acceptable design standards and operational practices for aerobic lagoons. Other states were then consulted as to their practices, and the installations already functioning in Utah at that time were studied to determine what reasonable standards might be evolved. Because of the limitation of knowledge in the area, all projects sanctioned by the state are subject to testing after completion before they are finally accepted. The complete set of regulations of the state of Utah at the present time is presented along with some of the data used to arrive at these regulations. (See also W71-07079) (Lowry-Texas)

QUALITY PERFORMANCE OF WASTE STABILIZATION LAGOONS IN MICHIGAN,
Michigan State Dept. of Health.
Maurice S. Richmond.
2nd International Symposium for Waste Treatment Lagoons, June 23-25, 1970, Kansas City, Missouri, p 54-63. 12 fig.

Descriptors: *Oxidation lagoons, *Performance, Waste water treatment, Seepage, Odors, Percolation, Evaporation, Anaerobic conditions, Aerobic conditions, Coliforms, Fecal coliforms, Phosphates, Sampling, Hydrogen ion concentration, Biochemical oxygen demand, *Michigan.
Identifiers: *Data analysis, Total suspended solids.

A performance review of lagoons in Michigan during the period of 1961-1970 was made. The objective was to determine lagoon performance in general, and more specifically, to determine optimum conditions with respect to design and operational control under Michigan climatic conditions. DO, BOD, TSS, VSS, pH, total coliforms, and fecal coliform tests were the parameters that have been used to determine the effluent quality of water in the lagoon, and the water discharged semiannually in the late fall and early spring. The total hydraulic retention of flow is approximately 6 months. A significant fact revealed in this study was that lagoons are providing waste water treatment at least equivalent to, and in some cases better than, that

provided by conventional secondary treatment, including removal or reduction of BOD, TSS, and coliforms. One reason for this is the complete elimination of any effluent what so ever during the extensive period of total retention. By discharging during the spring and fall, maximum flows permit maximum natural degradation with minimum pollutional problems. (See also W71-07079) (Lowry-Texas)

EVALUATION OF LAGOON PERFORMANCE IN LIGHT OF 1965 WATER QUALITY ACT,
Ryckman, Edgerley, Tomlinson and Associates, Clayton, Mo.
G. M. Barsom, and D. W. Ryckman.
2nd International Symposium for Waste Treatment Lagoons, June 23-25, 1970, Kansas City, Missouri, p 63-80. 11 fig, 8 tab, 61 ref. USPHS Grant EH 66-611.

Descriptors: *Oxidation lagoons, *Water quality act, Waste water treatment, Eutrophication, Odors, Nitrogen, Phosphorus, Chemical oxygen demand, Biochemical oxygen demand, Mixing, Missouri.
Identifiers: *Putrefaction, Illumination, Suspended solids, Volatile suspended solids.

The bulk of the work done in the last three decades on oxidation ponds has been concerned primarily with (1) algal production and classification, and (2) development of design criteria for organic and hydraulic loadings of oxidation ponds. Lagoon performance has never been evaluated from the position of water quality criteria; nor has a comprehensive effort been made to evaluate the physical, chemical, and biological limiting factors which define lagoon performance. Therefore an evaluation program was devised to rate lagoons on the basis of water quality criteria and also on aesthetic success or failure. Lagoons in varying locations were studied for extended periods of time and evaluated. The following observations were made based on the evaluations: (1) effluent 5 day BOD from lagoons greatly exceeded the accepted effluent BOD standards, as did suspended solids both in the case of raw sewage, and tertiary oxidation ponds, and (2) removal of phosphates, nitrates, and coliforms was both in-effective and erratic. Based upon reduction of COD SS, VSS, nitrogen, and phosphorus, oxidation ponds did not significantly enhance water quality, and as presently designed, such ponds will not enhance, restore, or even maintain the present quality of receiving waters. FIELD STUDIES ON STABILIZATION PONDS IN SOUTH INDIA,
Missouri Univ., Rolla. Dept. of Civil Engineering.
Krishnier Purushothaman.
2nd International Symposium for Waste Treatment Lagoons, June 23-25, 1970, Kansas City, Missouri, p 80-88. 5 fig, 7 tab, 9 ref.

Descriptors: *Oxidation lagoons, Performance, *Climatic zones, Sampling, Saturation, Microorganisms, Coliforms, Biochemical oxygen demand, Dissolved oxygen, *Organic loading, Anaerobic conditions, Aerobic conditions, Depth, Waste water treatment.
Identifiers: *India, Detention time, Suspended solids.

Four experimental waste stabilization ponds were constructed at the College of Engineering, Guindy, Madras, India. Samples of the effluent and influent were obtained periodically, and analyzed for BOD, pH, and dissolved oxygen. The data was then recorded and studied to obtain information on organic and hydraulic loading, detention time, dissolved oxygen, and other parameters necessary in determining design criteria and lagoon performance. From the previously described tests, it was found that (1) when climatic conditions are favorable, lagoon loading can be increased to as much as 400% of the normal loading rates, (2) pond depth has no influence on operating efficiency under the conditions studied, (3) BOD removal efficiency was not affected by varying the detention time from 2 to 9 days, (4) dissolved oxygen was as much as 400% supersaturated during the day, but decreased to zero at night, (5) bacteria and coliform reductions were not affected by varying either depth, detention, or both, and (6) no correlation was discovered between organic loading rate, and the predominant phyto-and zoo-planktons. A DECADE OF STABILIZATION LAGOONS IN MICHIGAN WITH IRRIGATION AS ULTIMATE DISPOSAL OF EFFLUENT,
Williams and Works, Grand Rapids, Mich.
Earl A. Myers, and T. C. Williams.
2nd International Symposium for Waste Treatment Lagoons, June 23-25, 1970, Kansas City, Missouri, p 89-92. 1 tab, 8 ref.

Descriptors: *Waste water (Irrigation), *Oxidation lagoons, Rates of application, Crop production, *Irrigation practices, Return, *Water reuse, Recharge, Adsorption, Seepage, Erosion, Infiltration, Percolation, Sprinkler irrigation, Monitoring, Geology, Nitrogen, Phosphorus, Aerobic conditions, Anaerobic conditions, Waste water treatment, *Michigan.
Identifiers: Renovation.

The Michigan consulting engineering firm of Williams and Works has designed 28 stabilization lagoon type sewage treatment facilities, with 15 more to built shortly. All have been designed for nominal loadings of 20 lbs BOD/day/acre of water surface, and most of them have been designed for semi-annual discharge of lagoon effluent. Because of the increasingly stringent laws concerning the allowable amount of phosphorus present in waste effluent discharged to streams, irrigation has frequently been specified as a means of ultimate disposal. In the 4-R cycle of return, recycle, renovation, and reuse, irrigation plays a major role. By irrigating crops with treated effluent, the major portions of the excess nutrients such as phosphorus and nitrogen, are removed either by adsorbing into the soil particles or by utilization by the plants themselves. This process must be carefully planned and operated, both in the selection of the soil to be used and the crop to be planted, and also in the application rate. After removal in this manner, the water then either percolates through the ground and back into the groundwater table, or is drained off in surface channels to a receiving body of water. The irrigation of treated effluent depends upon the topography of the land, the type of irrigation system used, the type of crop which is able to grow in a certain area, and many other factors. However, when carefully designed, constructed, and operated, it can provide excellent treatment of lagoon effluent to insure its subsequent reuse. (See also W71-07079) (Lowry-Texas)

A DECADE OF RALSTON PURINA LAGOON EXPERIENCE,
Ralston Purina Co., St. Louis, Mo.
C. B. Smith.
2nd International Symposium for Waste Treatment Lagoons, June 23-25, 1970, Kansas City, Missouri, p 93-95. 3 fig.

Descriptors: *Oxidation lagoons, *Industrial wastes, *Organic loading, Odors, Maintenance, Aeration, Drawdown, Domestic wastes, Biochemical oxygen demand, Cooling water, Anaerobic conditions, Aerobic conditions, Waste water treatment, Alabama.
Identifiers: *Food processing wastes, Tussville (Alabama).

21 lagoon systems are owned or utilized by Ralston Purina Co. Types of wastes being treated are chicken and turkey dressing plant wastes, dairy wastes, rendering plant wastes, hog, dog, and cat wastes, Mink Chow mixing plant wastes, and human sewage. Lagoons, usually around 6' deep are operated at loading rates of approximately 1000 lb BOD/acre/day, with detention time between 5 and 10 days. The advantages of lagoon systems are, (1) high degree of treatment, (2) lack of odor, (3) low maintenance cost, (4) ability to handle shock loads, (5) lagoons can be utilized as a source of cooling water for condenser operation, (6) low initial cost if land is reasonable priced. Details of the construction practices of Ralston Purina's lagoon systems are included along with one specific example system located at Trussville, Alabama. (See also W71-07079) (Lowry-Texas)
W71-07090

A COMPARISON OF AN EFFICIENT LAGOON SYSTEM WITH OTHER MEANS OF SEWAGE DISPOSAL IN SMALL TOWNS,
Bowling Green State Univ., Ohio.
Karl Schurr.
2nd International Symposium for Waste Treatment Lagoons, June 23-25, 1970, Kansas City, Missouri, p 95-100. 8 fig, 9 ref.

Descriptors: *Oxidation lagoons, *Comparative costs, Population, Sampling, Biochemical oxygen demand, Chlorides, Nitrites, Nitrates, Phosphates, Coliforms, Dissolved oxygen, Turbidity, Maintenance, Waste water treatment, *Treatment facilities.
Identifiers: Suspended solids.

An oxidation lagoon and a conventional primary secondary sewage treatment facility were compared with respect to pH, turbidity, nitrates, phosphates, nitrites, chloride, conductivity, and coliform bacteria, by comparing the final tank of the lagoon system to the receiving stream of the conventional system. The oxidation lagoon was found to provide a significantly higher degree of waste treatment at a lower cost. The results of the lagoon versus conventional treatment comparison indicate that lagoons may be of significant value in smaller towns and cities where economy is essential. In most of the smaller towns, land values are within the range of price where economical lagoons may be built. Other attractive features of lagoons are their low maintenance costs, and lesser labor requirements. More work is necessary to improve the efficiency of lagoons, but they are already a promising alternative to areas which need treatment facilities but cannot afford conventional plants. CARBON BUDGET AND TOTAL PRODUCTIVITY OF AN ESTUARINE OXIDATION POND RECEIVING SECONDARY SEWAGE EFFLUENT,
Institute for Environmental Health Studies, Morehead City, N.C.
John W. Day, Jr., Charles M. Weiss, and H. T. Odum.
2nd International Symposium for Waste Treatment Lagoons, June 23-25, 1970, Kansas City, Missouri, p 100-113. 15 fig, 15 ref. Public Health Service Training Grant ES 61, National Science Foundation Sea Grant GH18, North Carolina Board of Science and Technology Grant RA005.

Descriptors: *Oxidation lagoons, *Computer models, *Mathematical model, Light intensity, Dissolved oxygen, Hydrogen ion concentration, Temperature, Carbon dioxide, Eutrophication, Respiration, Photosynthesis, Evaporation, Sedimentation, Waste water treatment, *Estuarine environment, Computer programs.
Identifiers: Differential equations, Inorganic carbon, Organic carbon.

A waste stabilization lagoon was modeled on a digital computer in PL/1 computer language. Included in the program are constants for influent light intensity, rate of respiration, rate of photosynthesis, and other parameters. All of the constants were determined from experimental st

lies of existing waste stabilization lagoons. These tudies were performed in their entirety for over a ear. The data was then analyzed and arranged to rrive at the desired constants. Development of a nodel which was deemed a satisfactory representa- ion of the pond system allowed work to be done on he effect which various outside stimuli will have on ystem performance, with the desired end result eing the prediction of changes which will be un- ergone by aquatic environments receiving a cer- ain waste flow. The model may also be used to letermine avenues of further investigation in as- essing the effects of treated sewage on estuarine ystems. (See also W71-07079) (Lowry-Texas)

TABILIZATION POND DESIGN CRITERIA OR TROPICAL ASIA,
sian Inst. of Tech., Bangkok (Thailand). Dept. of nvironmental Engineering.
. G. McGarry, and M. B. Pescod.
nd International Symposium for Waste Treatment agoons, June 23-25, 1970, Kansas City, Missouri, 114-132. 15 fig, 6 tab, 38 ref.

Descriptors: *Oxidation lagoons, *Aesthetics, Odors, Temperature, Organic loading, Depth, Temperate zones, Tropic zones, Comparative osts, Hydrogen ion concentration, Biochemical xygen demand, Anaerobic conditions, Aerobic onditions, Recirculated water, Waste water treat- ent.
dentifiers: Facultative ponds, *Asia.

Current literature on waste water treatment using naerobic, facultative, or anaerobic-aerobic agoons was examined to determine what changes n design criteria were possible for the Asian en- ironment. From these studies, the following con- lusions were drawn for anaerobic ponds: (1) areal OD laoding maintains the greatest influence on real BOD removal, with influent pH and hydraulic etention period being less significant, (2) the max- mum areal BOD laoding which will still allow the ond to stay above pH 6 will give greatest areal OD removal, (3) maintaining maximum BOD on ll stages gives greatest removal and most efficient nd use, (4) recirculation of pond effluent will ecrease odors but will decrease BOD removal lso. For facultative ponds, equations were eveloped for maximum BOD removal with respect o both temperature and areal BOD loading. For any developing countries, the use of oxidation agoons present and economical solution to pollu- on problems. Land restrictions, in many instances orce consideration of anaerobic lagoons, but the opulations of most developing countries are less onscious of aesthetics than those of developed ountried. URVIVAL OF ENTERIC BACTERIA AND IRUSES IN MUNICIPAL SEWAGE LAGOONS,
lew Hampshire Univ., Durham. Dept. of Microbiology.
. W. Slanetz, Clara H. Bartley, T. G. Metcalf, and . Nesman.
nd International Symposium for Waste Treatment agoons, June 23-25, 1970, Kansas City, Missouri, 132-141. 6 fig, 6 tab, 12 ref.

Descriptors: *Oxidation lagoons, *Temperature, Pathogenic bacteria, Coliforms, Salmonellae, En- eric bacteria, Stagnant water, Seepage, Membrane ilters, Waste water treatment, Municipal wastes.
dentifiers: *Enteric viruses, *Multi-stage lagoons, urvival rates, Fecal streptococci, Fecal coliforms.

amples were taken from the oxidation lagoons of hree communities, one community having a single ond, one a three pond series, and one a four pond eries. The samples were analyzed for coliforms, ecal coliforms, fecal streptococci, salmonellae, nd enteric viruses. The results were arranged in abular form and analyzed for % removal. Die-off f coliforms ranged from 95-99% for one or two tage ponds in series at 17 to 26 C. Salmonellae and enteric viruses were isolated at all seasons from the majority of effluent samples. Coliforms showed a marked increase in survival rate during the winter temperatures of 1 to 10 C. In the three or four pond series, counts at 10 to 26 C were as low as two/ml or less for coliforms, fecal coliforms, and fecal streptococci. Salmonellae were isolated from only one out of 24 samples from the third or fourth pond during the summer periods, but the numbers of indicator organisms, and the frequency of isolation of pathogens was appreciably higher during the winter. Also, a significant number of enteric viruses were isolated from samples year around. Therefore, oxidation pond effluent discharged directly to receiving water may create health hazards. BACTERIA REMOVAL IN OXIDATION PONDS,
Federal Water Quality Administration, Washington, D.C.
John A. Little, Bobby G. Carrol, and Ralph E. Gentry.
2nd International Symposium for Waste Treatment Lagoons, June 23-25, 1970, Kansas City, Missouri, p 141-151. 10 fig, 2 tab, 8 ref.

Descriptors: *Oxidation lagoons, *Coliforms, Sampling, Membrane filter, Bacteria, Organic loading, Mixing, Waste water treatment, Biochemical oxygen demand.
Identifiers: Multi-cell ponds, Short-circuiting, Detention time, Most probable number, Fecal coliforms.

Nine stabilization ponds throughout the Southeastern United States were analyzed including single cell ponds, and multi-stage ponds both in series and in parallel. Grab samples of influent and effluent were measured for both total and fecal coliforms by both the MPN method and also the membrane filter method. Sampling was spread over a two year period with more than 600 samples taken and analyzed. Dilution capacities in excess of a thousand fold would be needed to prevent effluent from single celled ponds from far exceeding present water quality criteria. Multi-stage series ponds significantly enhanced removals of both fecal and total coliforms, and are highly recommended for converting single stage ponds. Also, effluent bacterial densities varied by an order of magnitude from one moment to the next in single stage ponds, indicating considerable short-circuiting problems in the single stage reactors. Organic loading has little or no effect upon effluent bacterial concentration, the most significant parameter being true detention time. Improvement was needed also in the overflow weirs, since floating solids in many cases were passed directly through the system. From the above factors, it was concluded that effluent chlorination could be needed in some cases, but that the individual situation must be studied to determine the need. (See also W71-07079) (Lowry-Texas)
W71-07095

CHLORINATION OF WASTE POND EFFLUENTS,
Sacramento State Coll., Calif.
Leonard W. Hom.
2nd International Symposium for Waste Treatment Lagoons, June 23-25, 1970, Kansas City, Missouri, p 151-159. 7 fig, 4 tab, 15 ref. National Science Foundation Grant GY3799, National Institute of Health, USPHS, WP00026-RS.

Descriptors: *Oxidation lagoons, *Disinfection, Degradation, Chlorine, Contact time, Sampling, Coliforms, Bacteria, Oxidation, Organic loading, Algae, Waste water treatment, Biochemical oxygen demand.
Identifiers: *Residual, Most probable number.

A two year series of tests were performed on effluent from experimental stabilization lagoons of the City of Concord, California, in an attempt to determine methods for controlling algae kill by controlling chlorine dosage. Three day composite samples, of 500 ml volume, were taken at three-hour intervals, and the chlorine demand was determined by the OT test using a 30 min. contact time. In addition, the samples were analyzed for BOD levels and for coliform population. Selective chlorination of stabilization lagoon effluents can be accomplished. Control of reaction and chlorine concentration is critical, since excessive chlorine can release nutrients from algal cells, thereby increasing the BOD. The solution lies in experimental optimization of both chlorine dosage and residual chlorine concentrations. Time-concentration relationships reported here provide a rational set of process design parameters for chlorine disinfection in algal-bacterial systems. (See also W71-07079) (Lowry-Texas)
W71-07096

EFFECT OF LAGOON EFFLUENT ON A RECEIVING STREAM,
Missouri Univ., Columbia.
Darrell L. King, Allen J. Tolmsoff, and Michael J. Atherton.
2nd International Symposium for Waste Treatment Lagoons, June 23-25, 1970, Kansas City, Missouri, p 159-167. 5 fig, 4 tab, 3 ref.

Descriptors: *Oxidation lagoons, *Algae, *Trickling filters, Eutrophication, Photosynthesis, Dissolved oxygen, Sedimentation, Sampling, Chemical oxygen demand, Biochemical oxygen demand, Stabilization ponds, Microorganisms, Biodegradation, Waste water treatment, Water pollution effects.
Identifiers: *Riffles, *Caloric content.

Bear Creek, a small stream whose flow is 21.5% lagoon effluent and seepage, was the site of a 90 day study which attempted to determine what stream parameters or characteristics were altered by lagoon effluent. Parameters monitored were, BOD, COD, and also volatile, suspended, and other solids measurements. The oxygen demands of the various constituents were then calculated and analyzed. From these experiments, it was determined that receiving streams for algae-laden effluents can be significantly influenced from several feet to several miles downstream. The amount of flow in the stream, and the riffle-pool ratio were found to be the factors which determine the distance downstream which a stream will be affected. Smaller streams may be broken down into riffles, which act much like trickling filters, and pools, which are merely sedimentation and digestion units. A major point of these experiments was demonstration of the fact that the receiving stream, in many cases, is an integral part of the treatment facility and must be considered as such before the total system can be evaluated. W71-07097

EFFECTS OF OXIDATION POND EFFLUENT ON RECEIVING WATER IN THE SAN JOAQUIN RIVER ESTUARY,
Federal Water Quality Administration, Pacific Southwest Region, California/Nevada Basins Office.
Richard C. Bain, Jr., Perry L. McCarty, James A. Robertson, and William H. Pierce.
2nd International Symposium for Waste Treatment Lagoons, June 23-25, 1970, Kansas City, Missouri, p 168-180. 8 fig, 6 tab, 8 ref.

Descriptors: *Oxidation lagoons, *Oxygenation, *Algae, Depth, Temperature, Photosynthesis, Reaeration, Light penetration, Nutrients, Phosphorus, Nitrogen, Tidal waters, Chemical oxygen demand, Biochemical oxygen demand, Waste water treatment, Water pollution effects.
Identifiers: *San Joaquin River.

Oxidation pond effluent entering the San Joaquin river estuary was assumed to be a major cause of low dissolved oxygen levels, and resultant fish kills. In an effort to prove or disprove this assumption, factors considered related to dissolved oxygen con-

centration were studied. These factors included water temperature, algal population, oxygen demands, nutrients, and channel and flow characteristics. Samples were taken from the river at various times, from influent and effluent from the treatment plant, and from the oxidation lagoon. They were then analyzed for NH3-nitrogen, NO3-nitrogen, organic nitrogen, organic carbon, carbonate alkalinity, bicarbonate alkalinity, orthophosphorus, total phosphorus, 5 day BOD, 30 day BOD, and COD. From the preceding investigations, it was determined that depressed oxygen levels were the result of both physical and biological factors. Physically, the deepening of the channel reduced tidal velocity and thereby reduced turbulence and rate of natural re-oxygenation, leading to lower oxygen transfer rates. Biologically, algae thrives in both the oxidation ponds and the shallow river, but is trapped in the deeper channel where light pentration is insufficient to support it. The algae then decomposes and requires oxygen. The problem then, is a complex combination of factors which requires the system approach, if a fully comprehensive solution is to be obtained. W71-07098

MATHEMATICAL SIMULATION OF WASTE STABILIZATION PONDS,
Federal Water Quality Administration, Cincinnati, Ohio. Advanced Waste Treatment Labs.
Joseph F. Roesler, and Herbert C. Preul.
2nd International Symposium for Waste Treatment Lagoons, June 23-25, 1970, Kansas City, Missouri, p 180-185. 20 ref.

Descriptors: *Oxidation lagoons, *Mathematical models, Mixing, Water re-use, Light intensity, Evaporation, Re-aeration, Dissolved oxygen, Algae, Anaerobic conditions, Aerobic conditions, Biodegradation, Seepage, Sludge, Cost analysis, *Biochemical oxygen demand, Waste water treatment.

The mass balance approach was used to obtain equations relating to oxidation lagoon processes. The model was based on the assumption that the influent was domestic sewage, and that an anaerobic sludge layer was formed at the bottom of the pond. Equations were derived for BOD removal by algae, anaerobic decomposition, and oxidation pond depth. In order to verify equations derived from the mass balance approach, experimental data on effluent BOD, detention time, sunlight intensity, temperature, evaporation rate, and dissolved oxygen deficiency were obtained from the literature. A computer program was then designed to evaluate the constants and the disposition of all BOD's. From the preceding equation and calculations, it was concluded that: (1) oxidation lagoons are economical to build and maintain, (2) the role of algae has been overemphasized, with re-aeration and anaerobic processes equally, if not more, important, and (3) since algae occasionally interfere with receiving stream water quality, investigations should be conducted in how to maximize anaerobic decomposition at the bottom and minimize algae production. (See also W71-07079) (Lowry-Texas)
W71-07099

DESIGNING WASTE PONDS TO MEET WATER QUALITY CRITERIA,
California Univ., Berkeley. Dept. of Sanitary Engineering and Public Health.
William J. Oswald, Aaron Meron, and Mario D. Zabat.
2nd International Symposium for Waste Treatment Lagoons, June 23-25, 1970, Kansas City, Missouri, p 186-194, 3 fig, 4 tab, 23 ref.

Descriptors: *Oxidation lagoons, *Design criteria, *Water quality, Algae, Harvesting, Depth, Temperature, Light intensity, Chemical precipitation, Hydrogen ion concentration, Coliforms, Bacteria, Photosynthesis, Organic compounds, Phosphates, Nitrates, Nutrients, Anacrobic conditions, Aerobic conditions, Biochemical oxygen demand, Waste water treatment.

The overall process of waste stabilization in oxidation lagoons was examined from a logical design standpoint. Significant factors were examined from the literature, and these included infectious agents, plant nutrients, organic chemicals, and land erosion and subsequent addition of minerals, chemicals, and silts, radioactive substances, and heat pollution. In each case, design practices both from literature research and practical experience were presented. A summary of the three years of operation of the Saint Helena Waste Pond system is presented in support of the design practices previously advocated. Water quality control of a high order is consistently obtained at the Saint Helena Plant, and this control is attributed mainly to these improved design practices. Further improvement may be possible with addition of algae harvesting facilities which will also remove phosphates, but since there is little or no effluent from the ponds now the present system more thatn complies with current standards. W71-07100

CURRENT DESIGN CRITERIA FOR OXIDATION PONDS,
Federal Water Quality Administration, Washington, D.C. Construction Grants and Engineering Branch.
Evan D. Dildine, and Joseph R. Franzmathes.
2nd International Symposium for Waste Treatment Lagoons, June 23-25, 1970, Kansas City, Missouri, p 194-200. 2 fig, 2 tab, 5 ref.

Descriptors: *Oxidation lagoons, *Design criteria, Stabilization ponds, Seepage, Permeability, Evaporation, Erosion, Percolation, Mixing, Temperature, Anaerobic conditions, Aerobic conditions, Dikes, Waste water treatment.
Identifiers: *Multi-cell ponds, Start-up problems.

A brief overview of the design and operation of oxidation lagoons is presented. In the past, design of these facilities was largely a matter of chance, with experience being the best teacher in determining the final design. Now, however, with the advent of even more stringent pollution control laws, there must be analytical tests devised in order to measure pond performance and determine more fully the critical parameters involved in the design of such facilities. Although the problems associated with evolving these new design criteria are many, it is believed that under favorable conditions of climate and land values, stabilization ponds will continue to play a major role both in providing economical waste water treatment for small communities, and in helping to alleviate pollutional problems. NEW EXPERIMENTAL POND DATA,
Texas Univ., Austin. Environmental Health Engineering Research Lab.
E. F. Gloyna, and J. Aguirre.
2nd International Symposium for Waste Treatment Lagoons, June 23-25, 1970, Kansas City, Missouri, p 200-210. 3 fig, 10 tab, 10 ref.

Descriptors: *Oxidation lagoons, *Sludge, Anaerobic conditions, Aerobic conditions, Pilot plants, Algae, Hydrogen ion concentration, Chemical oxygen demand, *Biochemical oxygen demand, Mixing, Sampling, Organic loading.
Identifiers: Laboratory scale, *Total organic carbon.

Three laboratory-scale units and three pilot-scale unites were constructed and operated for a period of eight months at the conventionally accepted loading rates of 70 lbs BODu/acre/day and 65 day detention time for the pilot scale plants, with only 10 lbs BODu/acre/day and 90 days detention time in the lab scale units. The only difference in the three units was the location of the anaerobic sludge deposition zone. Organic removal efficiencies were determined by tests on BOD5, COD, and TOC. Suspended solids removal was determined by membrane filter analysis, and general pond characteristics were evaluated through measurement of pH, DO, temperature, nitrogen, phosphorus, and algae typing. From this experimental evaluation, it was determined that pilot scale systems are of considerable value in arriving at design criteria for a particular waste in a particular locality. Pilot plants lack many of the disadvantage of lab scale plants mainly due to the increased size, and therefore, decreased sensitivity of the pilot plants. Also, series arrangement of a multiple pond system had a much greater effect than did changing the location of the sludge deposition zone. One of the pond systems utilized for this study operated on the same principal as a series pond arrangement, and the anaerobic pretreatment portion of the system provided 50 to 76% reduction of organic material in from 3 to 5 days between 12 and 24C. THEORY OF AERATED LAGOONS,
Black and Veatch, Kansas City, Mo.
Henry Benjes, Jr.
2nd International Symposium for Waste Treatment Lagoons, June 23-25, 1970, Kansas City, Missouri, p 210-217. 6 fig, 1 tab, 19 ref.

Descriptors: *Oxidation lagoons, *Mathematical models, Turbulence, Mixing, Organic loading, Aeration, Dissolved oxygen, Sedimentation, Biochemical oxygen demand, Aerobic conditions, Anaerobic conditions, Sludge, Waste water treatment.
Identifiers: Aerated oxidation ponds, Facultative aerated lagoons.

Completely mixed aerated lagoons, facultative aerated lagoons, and aerated oxidation ponds have been designated as the major categories of aerated lagoons. Equations for the completely mixed aerated lagoon have been developed by three different individuals, and all three equations differ in some respect. Types of mixing equipment used, and levels of mixing provided have been demonstrated to be at least as, or possible more important than the aeration considerations. Large slower moving impellers were shown to be more efficient mixing devices than either fast moving small impellers or air diffusion devices. Facultative lagoons require less power and provide excellent treatment for wastes having a high concentration of settleable of organic settleable solids. However, the complexity of the system makes it necessarily harder to define, and as a consequence, most facultative lagoons are based on empirical design parameters. The aerated oxidation pond merely behaves like a high rate oxidation pond, drawing its oxygen supply during the warm months primarily from its algal growth, and providing satisfactory treatment even when loaded as high as 1000 lbs BOD/acre. AERATED LAGOONS IN ONTARIO-DESIGN AND PERFORMANCE CONSIDERATIONS,
Ontario Water Resources Commission, Toronto Div. of Research.
B. I. Boyko, and J. W. G. Rupke.
2nd International Symposium for Waste Treatment Lagoons, June 23-25, 1970, Kansas City, Missouri, p 218-220.

Descriptors: *Oxidation lagoons, *Design criteria, Organic loading, Turbulence, Mixing, Aeration, Dissolved oxygen, Aerobic conditions, Anaerobic conditions, Sludge, Odors, Municipal wastes, Industrial wastes, Biochemical oxygen demand.
Identifiers: Multi-cell lagoons, *Ontario (Canada).

Virtually all aerated lagoons in Ontario were constructed within the last ten years. Many such installations were expected to provide total treatment of wastes, and even single stage lagoons were constructed to treat high strength industrial wastes. After ten years of experience, it is now accepted that (1) lagoons do not require 100% of treatment of organic wastes, and (2) multi-stage lagoons pro-

de a much higher degree of treatment than do sin-
le stage installations. A volumetric loading of 2lb
OD/1000 cu. ft. is now the accepted design stan-
ard which will provide satisfactory effluent quali-
. However, in cases where both municipal and in-
ustrial wastes are to be treated together, the
reliminary biodegradability studies should be per-
ormed on a representative sample in order to
void having to put in too much mixing capacity,
hereby disturbing the anaerobic sludge layer, in
rder to satisfy the oxygen demand. (See also W71-

udge, Anaerobic conditions, Aerobic conditions,
iochemical oxygen demand, Waste water treat-
ent.
entifiers: Aerated lagoons, Facultative lagoons.

everal lagoons for waste treatment, aerated,
naerobic, and facultative, were studied to deter-
ine the feasibility of their application to colder
imates. Aerated lagoons were found to provide
eatment in the summer time of 80 to 88%, and
movals of 80 to 90% during the winter using gross
ubble air diffusion systems. Non-aerated lagoons,
owever, must be designed for total retention of
astes in the winter since virtually no treatment
kes place then. The optimum system studied was
multicelled lagoon providing for a shallow treat-
ent lagoon for summer treatment and a large
inter lagoon for storage. The loading on such an
stallation was found to be less than 50 lbs
OD/acre/day to provide maximum treatment
nefits. Higher loadings resulted in increasing
lor problems. Selection of rugged equipment in
rder to minimize breakdown and repairs is essen-
al to this type of operation, since maintenance is
e largest cost involved. (See also W71-07079)

ent.
entifiers: *Aerated lagoons, Suspended solids.

he various parameters involved in the design of
erated lagoons were investigated with particular
ference to the use of air diffused into the lagoon
rough lengths of tubing. It was determined that a
esign for an aerated lagoon should evolve in three
ages, each to be evaluated for summer and winter
onditions. To design an aerated lagoon, the first
age involves evaluation of the receiving body by
oth the waste producers, and the agency responsi-
e for the protection of the quality of the receiving
ater. The required effluent quality determination
based on BOD, suspended solids, effluent
oliform organism count. Determination of the de-
ntion time required to achieve the stage I objec-
tives is the second stage, and the final stage in-
volves an evaluation of the oxygen needed to
supply both the aeration tank mixed liquor solids
respiration, and the benthal oxygen demand. Con-
servative overall design values are recommended
because of the gaps in the research data. Until
more research has been done to investigate the
constants and the mechanisms of the process, con-
servative estimates will continue to be recom-
mended in order to provide a larger margin of
safety. (See also W71-07079) (Lowry-Texas)
W71-07106

AERATED LAGOONS FOR POTATO PROCESSING WASTES,
Federal Water Quality Administration, Corvallis,
Oreg. Pacific Northwest Water Lab.
Kenneth A. Dostal.
2nd International Symposium for Waste Treatment
Lagoons, June 23-25, 1970, Kansas City, Missouri,
p 243-249. 2 fig, 6 tab, 6 ref.

Descriptors: *Oxidation lagoons, *Industrial
wastes, Alkalinity, Organic loading, Hydrogen ion
concentration, Nutrients, Biochemical oxygen de-
mand, Anaerobic conditions, Aerobic conditions,
Trickling filter, Cost analysis, Waste water treat-
ment.
Identifiers: *Aerated lagoons, Suspended solids,
*Potato wastes.

Pilot-scale plants were operated for two nine
month processing seasons on potato wastes. 4200
gallons of fresh water were used to process each
ton of potato wastes, producing 90 lbs of BOD, 210
lbs of COD, 110 lbs of suspended solids, .6 lbs of
total phosphates as P, and 3.5 lbs of total nitrogen
as N on the nine month average. Schematic dia-
grams of the pilot plants were constructed and are
presented. From the preceding studies, the follow-
ing conclusions were obtained: (1) either an aero-
bic lagoon or an anaerobic-aerobic lagoon series in
conjunction with primary sedimentation can
achieve as high as 90% BOD reduction, (2) both
systems are economically feasible, the choice de-
pendent upon local conditions, (3) constants
derived from this study were used to formulate
models to adequately describe BOD reduction
across the ponds, (4) chemical additions were not
required for either pH control or inorganic nutrient
adjustment; and (5) some method of suspended
solids removal will usually be required. Several full
scale installations have recently been placed in ser-
vice, but data is not yet available. (See also W71-
07079) (Lowry-Texas)

AERATED LAGOON TREATMENT OF LONG ISLAND DUCK WASTES,
Cornell Univ., Ithaca, N.Y. Dept. of Civil Engineer-
ing; and Cornell Univ., Ithaca, N.Y. Dept. of
Agricultural Engineering.
Raymond C. Loehr, and Dennis D. Schulte.
2nd International Symposium for Waste Treatment
Lagoons, June 23-25, 1970, Kansas City, Missouri,
p 249-258. 7 fig, 2 tab, 11 ref.

Descriptors: *Oxidation lagoons, *Farm wastes,
Pilot plants, Chlorination, Phosphates, Mixing,
Coagulation, Flocculation, Dissolved oxygen,
Biochemical oxygen demand, Aerobic conditions,
Anaerobic conditions, Cost analysis, Design
criteria, Mathematical models, Waste water treat-
ment.
Identifiers: *Aerated lagoons, *Duck wastes.

Laboratory treatability studies were conducted in
1965 to determine the feasibility of treating duck
wastes in a number of treatment systems. Pilot
scale tests were then run on a aerated lagoon
system in 1967. The pilot plant had a 250,000 gal-
lon capacity, an 8 ft depth, and a 5 HP floating
aerator. 35% of the duck waste water systems sub-
sequently installed provided in excess of 90% BOD
reduction, and 50% provided in excess of 85%
BOD reduction, with aerator power relationships
ranging from .008 to .04 nameplate horsepower per
1000 gallons. These systems included aerated
lagoons, settling ponds, and chlorination. Studies
are presently being conducted on the new methods
of phosphate removal, with some type of removal
to be implemented as soon as possible. (See also

A COMPARATIVE STUDY OF AERATED LAGOON TREATMENT OF MUNICIPAL WASTE WATERS,
Metropolitan Corp. of Greater Winnipeg
(Manitoba). Water Works and Waste Disposal Div.
G. E. Burns, R. M. Girling, A. R. Pick, and D. W.
Van Es.
2nd International Symposium for Waste Treatment
Lagoons, June 23-25, 1970, Kansas City, Missouri,
p 258-276. 14 fig, 3 tab, 6 ref.

Descriptors: *Oxidation lagoons, *Climatic zones,
*Cost analysis, Temperature, Nutrients, Dissolved
oxygen, Algae, Sludge, Oxygenation, Anaerobic
conditions, Aerobic conditions, Biochemical ox-
ygen demand, Waste water treatment.
Identifiers: *Aerated lagoons, Surface aerators.

Three pilot scale aerated lagoons were constructed
at Winnipeg, Canada to test the effect of the
Canadian prairie climatic conditions on lagoon
operation. The pilot cells were of the anaerobic-
aerobic type. Each lagoon was equipped with a dif-
ferent type of aeration system, diffused air, surface
aerators, or a combination of both. Test were con-
ducted over a 20 month period on an influent
averaging 175 mg/l BOD and 188 mg/l of
suspended solids. From the results of this investiga-
tion, it was concluded that aerated lagoons can
satisfactorily provide secondary treatment under
prairie climatic conditions. BOD removal efficien-
cy and dissolved oxygen concentration both un-
dergo a seasonal summer decline due to the build-
up of sludge during the summer months. The
prevailing consideration for economic feasibility of
an aerated lagoon system is the extent and cost im-
plications of sludge removal and disposal facilities.
Also the use of surface aerators was demonstrated
to be impractical in areas which sustain large
amounts of ice cover. Research is continuing on the
economic factors involved in sludge removal and
disposal. (See also W71-07079) (Lowry-Texas)

BIO-FLOTATION TREATMENT IN REFINERY WASTE WATER EFFLUENTS,
American Oil Co., Whiting, Ind.
R. C. Mallatt, and J. F. Grutsch.
2nd International Symposium for Waste Treatment
Lagoons, June 23-25, 1970, Kansas City, Missouri,
p 276-284. 14 fig, 2 tab.

Descriptors: *Oxidation lagoons, *Oil wastes, Tur-
bidity, Phenols, Odor, Biochemical oxygen de-
mand, Pilot plants, Coagulation, Emulsions,
Sludge, Phosphate, Baffles, Waste water treatment,
Incineration.
Identifiers: *Bio-flotation, API separator, Cyclone
scrubber, Skimmers.

Waste streams at the American Oil company plant
at Whiting, Indiana are separated, with sanitary
wastes going to the municipal wastes treatment
plant, and the oily process wastes being channeled
through an API separator to a biofloation unit. The
solids created in the unit are either removed by
skimming devices from the top or by accumulating
as sludge on the bottom and being removed
periodically. Brush aerators are now being installed
to provide: (1) mixing (2) oxygenation, (3) fine
bubbles for the air flotation of solids, (4) a velocity
gradient in the water. Being installed in conjunc-
tion with the brush aerators are baffles and roller
drum skimmers. To complete the treatment
process, the waste sludge is accumulated, dried,
and incinerated in a fluidized bed incinerator. No
significant cost data on the incinerator system was
available for this report, but experience gained thus
far indicated that the fluidized bed incinerator

presented a practical solution to the oily sludge disposal problem. (See also W71-07079) (Lowry-Texas)
W71-07110

CURRENT DESIGN CRITERIA FOR AERATED LAGOONS,
Burns and McDonnell Engineering Co., Kansas City, Mo.
Weston E. Goodnow.
2nd International Symposium for Waste Treatment Lagoons, June 23-25, 1970, Kansas City, Missouri, p 285-286.

Descriptors: *Oxidation lagoons, *Design criteria, Temperature, Oxygenation, Loading, Biochemical oxygen demand, Waste water treatment, Tertiary treatment.
Identifiers: *Aerated lagoons, Detention time, Short circuiting.

A brief overview of the problems facing industries, consulting firms, and municipalities with respect to design criteria for aerated lagoons is presented. Many state regulatory agencies have not yet adopted standard design criteria for the design of aerated lagoons. Several items are listed as being important for regulatory agencies to consider when adopting standard design limitations. These include loading and minimization of short circuiting, plus the factors upon which these various parameters are to be based. (See also W71-07079) (Lowry-Texas)

AERATED LAGOONS AT HIGH ELEVATIONS,
William B. McDowell and Associates, Boulder, Colo.
Bill F. Pearson.
2nd International Symposium for Waste Treatment Lagoons, June 23-25, 1970, Kansas City, Missouri, p 286-293.

Descriptors: *Oxidation lagoons, *Design criteria, Elevation, Atmospheric pressure, Temperature, Solubility, Oxygenation, Aeration, Ice, Mixing, Organic loading, Chlorination, Disinfection, Waste water treatment.
Identifiers: *Aerated lagoons, Shock loads, Mechanical aeration, Air diffusers.

Many small towns, resort areas, and camp grounds are located at elevations above 5000 ft. Even stricter pollution measures are demanding that these areas continually upgrade their waste water treatment facilities. Stabilization lagoons, requiring little or no maintenance, capable of absorbing shock loads, and having minimal initial cost, have been proposed as a reasonable system for such communities. However, at these higher elevations, biological activity is reduced, atmospheric pressure (and oxygen solubility) is significantly decreased, and ice cover forces anaerobic conditions from which it is hard for the lagoon to recover. Aerated lagoons, however, can handle most of the previously mentioned problems. The critical factors involved in the design of aerated lagoons are the type of aeration to be used, temperature, lagoon configuration, and disinfection of effluent. A typical design analysis of an aerated lagoon is presented as a model to be followed when evaluation of a system is to be made. (See also W71-07079) (Lowry-Texas)
W71-07112

TERTIARY TREATMENT BY AERATED LAGOON,
V. N. Wahbeh, and L. W. Weller.
2nd International Symposium for Waste Treatment Lagoons, June 23-25, 1970, Kansas City, Missouri, p 293-299. 11 fig, 3 tab, 5 ref.

Descriptors: *Oxidation lagoons, *Tertiary treatment, *Design criteria, Trickling filters, Algae, Organic loading, Odor, Coliforms, Temperature, Dissolved oxygen, Aeration, Oxygenation, Nutrients, Sedimentation, Chlorination, Slopes, Biochemical oxygen demand, Hydrogen ion concentration, Waste water treatment, Kansas.
Identifiers: *Aerated lagoons, Suspended solids.

An oxidation pond, originally designed as the treatment facility for a small community and later superceded by a high-rate trickling filter plant, was remodeled and equipped with diffused air aeration using three 600 cfm blowers. This unit provided treatment mainly for storm bypass, until it was utilized as a tertiary stage to follow the trickling filter. Tests were then conducted, using an automatic sampling device, to determine the efficiency of such an arrangement during several short testing periods. It was discovered that conventional oxidation ponds lacking aeration were ineffective in reduction of BOD, suspended solids, and inorganic nutrients unless some method of algae harvesting was employed. Aerated lagoons, however, provided in excess of 60% reduction of BOD and suspended solids, although no detectable reduction in inorganic nutrients was evidenced. Some critical parameters for design of aerated lagoons are (1) greater than 4:1 and preferably a 2:1 side slope to prevent solids deposition on the slope, and (2) minimization of water surface area prevents unwanted algal cell growth which otherwise would defeat the purpose of the use of aerated lagoons instead of oxidation lagoons. (See also W71-07079) (Lowry-Texas)
W71-07113

A SIMPLIFIED KINETIC THEORY FOR AERATED LAGOONS,
Cape Town Univ. (South Africa).
G. V. R. Marais, and M. J. Capri.
2nd International Symposium for Waste Treatment Lagoons, June 23-25, 1970, Kansas City Missouri, p 299-310. 10 fig, 11 ref.

Descriptors: *Oxidation lagoons, *Kinetics, Mathematical models, Organic loading, Sludge, Fermentation, Degradation, Dissolved oxygen, Anaerobic conditions, Aerobic conditions, Temperature, Waste water treatment, Design criteria.
Identifiers: *Operational flexibility, Completely mixed reactor, Plugflow reactor, Multi-cell reactors, Recirculation, Incremental feeding.

The operational flexibility of oxidation lagoons combined in both series and parallel operation is examined through the use of the mathematical models developed from basic reactor kinetics. The relative advantages of plug flow reactors, completely mixed reactors, and combinations of the two types are discussed in detail. Constants were evaluated from data taken from experimental lagoons in order to derive the kinetic equations. The basis for the derivation of kinetic equations and type of reactor to be used is the assumption that the degradation of biological materials in an oxidation pond is of first order. The theoretical advantages of a series reactor versus a single stage reactor were then evident. Also, a multi-cell arrangement was shown to be more capable of coping with short-term overloading both on a hydraulic and an organic basis, because of the extreme operational flexibility involved. This flexibility allowed the treatment system to actually be tailored for the specific needs of the waste to be treated. (See also W71-07079) (Lowry-Texas)
W71-07114

ANAEROBIC LAGOONS-THEORETICAL CONSIDERATIONS,
John T. Pfeffer.
2nd International Symposium for Waste Treatment Lagoons, June 23-25, 1970, Kansas City, Missouri, p 310-320. 6 fig, 6 tab, 21 ref.

Descriptors: *Anaerobic digestion, *Kinetics, Metabolism, Fermentation, Temperature, Toxicity, Alkalinity, Sulfur, Hydrogen ion concentration, Odors, Methane, Methane bacteria, Carbon dioxide, Micro-organisms, Waste water treatment, Oxidation lagoons.
Identifiers: *Anaerobic lagoons, *Environmental control, Solids retention time.

Anaerobic lagoons differ from most conventional anaerobic digestion systems only by degree of control over the operation. The operator of a conventional digester can control mixing, heating, and since these tanks are covered, oxygen can be excluded almost entirely. The anaerobic lagoon lacks this variety of environmental control, and while this lack of control lowers the cost, it also narrows the range of the applicability. Each individual installation must be carefully evaluated. Toxicity due to heavy metals, sulfides, and ammonia are not easily controlled in a lagoon system. Odor problems may also be present. Lack of temperature control means that temperature conditions must be carefully studied. Decreased temperature, and subsequent decreased biological activity results in increased sludge production per unit of organics destroyed. Waste water containing only soluble organics would require long hydraulic retention times. On the other hand, with wastes of high suspended organic load, the solids accumulated on the bottom have the benefit of greatly increased retention time, causing many materials difficult to degrade to undergo complete degradation. The advantages and disadvantages presented must all be accounted for in the final design decisions before a rational choice can be made. (See also W71-07079) (Lowry-Texas)
W71-07115

ANIMAL MANURE LAGOONS, A QUESTIONABLE TREATMENT SYSTEM,
Samual A. Hart.
2nd International Symposium for Waste Treatment Lagoons, June 23-25, 1970, Kansas City, Missouri, p 320-324. 1 tab, 19 ref.

Descriptors: *Farm wastes, *Oxidation lagoons, Organic loading, Infiltration, Evaporation, Percolation, Aeration, Oxygenation, Odors, Sprinkler irrigation, Aerobic conditions, Anaerobic conditions, Biochemical oxygen demand, Waste water treatment.
Identifiers: Aerated lagoons.

Both oxidation lagoons and oxidation ditches can be of significant value to the agriculture industry. First introduced in the early 1950's, these lagoons proved to be inexpensive to build and offer a minimum of maintenance. However, this system must be carefully designed in order to provide adequate treatment of agricultural wastes, and this care in design has not been inherent to lagoons in the past. Comprehensive field studies on cow manure have indicated that 60 ft to the third power of aerated lagoon volume is necessary to treat 1 lb BOD 5/day. In between totally mixed and aerated lagoons, and conventional oxidation lagoons are various degrees of anaerobic and aerobic treatment. Similar studies conducted on hog waste fixed loading rates at 12 ft to the third power/400 lb pig as being capable of providing sufficient treatment. Oxidation lagoons were also studied, with loading rates of 30 ft to the third power/lb BOD5. Costs for the oxidation ditch treatment are $6 per hog of aeration equipment and $ 006 per hog per day of power requirements. Overall, oxidation lagoons and ditches, and aerated lagoons can provide sufficient treatment if properly designed and maintained. (See also W71-07079) (Lowry-Texas)
W71-07116

OPERATIONAL EXPERIENCES WITH SEWAGE LAGOONS,
Dallas City Water Utilities, Tex.
C. H. Williams.
2nd International Symposium for Waste Treatment Lagoons, June 23-25, 1970, Kansas City, Missouri, p 325-332. 5 fig, 7 tab.

Descriptors: *Oxidation lagoons, *Tertiary treatment, Sludge, Mixing, Temperature, Dissolved oxygen, Anaerobic digestion, Odors, Scum, Phosphates, Cost analysis, Waste water treatment, Texas.

entifiers: *Seeding, Detention time.

ie first sludge lagoons were installed in Dallas, in 40, and were used from then until the present ne. In 1960, it became evident that they were iously overloaded. The problem then became e of what to replace them with. After much stu-, a system of lagoons was constructed for use as tiary digesters at an initial cost of $251,000. erating costs involve 100 man hours/year and 200 for electricity per year. In comparison, dry- and/or incineration of the sludge required an in- l cost of $20,000,000, and $1,000,000/year erating costs. After 7 years, 1/3 of the capacity the lagoons has been used up and now con-butes only storage for the refractory materials. A g range plan includes construction of additional lti-cell series lagoons which are further removed m populated areas. Odor control at the present tallation has been imperative since the plant is mpletely surrounded by the City of Dallas. A tter understanding of seeding of feed, mixing uirements, scum and odor control, lining of its, and the superiority of anaerobic digestion for s situation has been attained from experience h the present plant. This knowledge will be ap-ed to future plants in their design and hopefully se plants will be much improved. (See also 71-07079) (Lowry-Texas)

GESTED SLUDGE LAGOONS,
yton, Ohio.
Fro Tossey.
d International Symposium for Waste Treatment goons, June 23-25, 1970, Kansas City, Missouri, 33-334.

scriptors: *Oxidation lagoons, *Tertiary treat-nt, *Sludge digestion, Anaerobic digestion, ors, Groundwater, Evaporation, Infiltration, Cli-tic conditions, Incineration, Air pollution, Tem-rature, Waste water treatment, Ohio.
ntifiers: *Supernatant re-cycle.

sposal of digested sludges in sludge lagoons has en accepted practice for the City of Dayton for years. The current land disposal facilities occu-15 acres and include both the lagoons and infil-tion beds where the supernatant is used to ir-ate the land. Success of sludge lagooning has en found to be dependent upon the quality of dge entering the lagoon. Inadequate primary and ondary digestion produces troublesome condi-ns in a sluge lagoon system. Solids destruction tinues within the bottom sludges, which are mated to be 20 to 25% solids, helping to al-iate problems associated with poorly digested dges. The soil through which the supernatant in-rates has shown no signs of blinding and has come quite enriched through deposition of or-ic matter. No documented evidence of ground-ter deterioration has been found but a system of ing is currently being organized to determine ether any deterioration is taking place. Lagoon-has been economical, and land disposal has ided both supernatant recycle and sludge in-eration with its associated air pollutional blems. Both practices will therefore continue to used by the City of Dayton. (See also W71-079) (Lowry-Texas)

PERIENCES WITH ANAEROBIC LAGOONS AUSTRALIA,
ter Science Laboratories, Carlton (Australia).
D. Parker.
l International Symposium for Waste Treatment goons, June 23-25, 1970, Kansas City, Missouri, 34-347. 6 fig, 16 tab.

scriptors: *Oxidation lagoons, *Design criteria, erobic conditions, Aerobic conditions, Indus-l wastes, Municipal wastes, Hydrogen ion con-tration, Biochemical oxygen demand, rients, Odors, Organic loadings, Sludge estion, Climatic conditions, Waste water treat-nt.
ntifiers: *Australia.

A variety of Australian oxidation lagoons are discussed briefly. Data is presented from the processing of Milk and slaughterhouse wastes, vegetable and cannery wastes, textile wastes, petroleum wastes, and potato wastes, along with the municipal wastes of the surrounding areas. The 3200 acre Melbourne installation, like most of the earlier plants has an anaerobic/aerobic area ration of 1/5. However, more recent installations treating industrial wastes and where odor-free operation is essential, have been constructed on a 1/1 anaerobic to aerobic area ratio to minimize loading on the anaerobic cell. These loadings range from 400 lbs/acre/day for winter conditions in a purely anaerobic pond to 250 lb/acre/day for winter conditions in a facultative pond. Summer loadings of 400 to 800 lbs/acre/day of combined food industry and municipal wastes are common in maintaining facultative conditions. When operated within these loading limits, purely anaerobic ponds can achieve 60 - 75% BOD reduction while facultative conditions can produce a 70 to 85% reduction. Regular operational control includes pH, dissolved oxygen, sulphide, BOD, SS, and other sanitary tests, to determine operating efficiency. Sludge wastage must be practiced to assure optimum lagoon performance. This is accomplished by pumping sludge to drying beds. When properly operated, lagoons, provide efficient, economical, and odor free treatment for Australian industries and municipalities. (See also W71-07079) (Lowry-Texas)
W71-07119

ANAEROBIC LAGOON TREATMENT OF PACKINGHOUSE WASTE WATER,
Nebraska Univ., Lincoln.
Mark J. Hammer, and C. Dale Jacobsen.
2nd International Symposium for Waste Treatment Lagoons, June 23-25, 1970, Kansas City, Missouri, p 347-354. 6 fig, 3 tab, 12 ref.

Descriptors: *Oxidation lagoons, *Industrial wastes, Anaerobic conditions, Odors, Temperature, Organic loading, Hydrogen ion concentration, Nutrients, Scum, Biochemical oxygen demand, Aerobic conditions, Sludge, Bacteria, Waste water treatment.
Identifiers: *Meat processing wastes, *Multi-cell reactors, Solids retention time, Grease, Baffles.

Anaerobic lagoons are currently being used as first stage treatment processes for meat-processing waste water in rural areas. Meat processing wastes, being of relatively high temperature (80 to 85F), high strength, and containing sufficient inorganic nutrients are highly amenable to anaerobic biological degradation. However, the variability of the process waste per unit of meat processed, the operation of by-product recovery and processing units, and the total work stoppage on week-ends produces a highly variable flow with a highly variable organic content. Anaerobic lagoons, with their storage capacity, long solids retention time, and ability to survive both periods of zero loading and periods of high or 'shock' loading, are well suited to treating packing-house wastes. Ther pertinent construction parameters in anaerobic lagoon construction are: pretreatment on the waste water; lagoon dimensions, particularly liquid depth and sideslopes; and placement of inlets and outlets. Pretreatment removes some grease and lowers the solids content which would otherwise fill the lagoon. Depths of greater than 12 feet along with sideslopes of 1 to 1 are recommended and inlets are to be placed 2-3' from the floor to prevent clogging. When operated at: organic BOD loading of 20lb BOD/1000 cu ft/day, minimum hydraulic detention time of 6 days, and minimum temperature of 75F, then BOD removal efficiences of 75% or greater are attainable. (See also W71-07079) (Lowry-Texas)
W71-07120

ANAEROBIC LAGOON TREATMENT OF PACKING WASTES IN LOUISIANA,
Louisiana State Dept. of Health, New Orleans.
James F. Coerver.
2nd International Symposium for Waste Treatment Lagoons, June 23-25, 1970, Kansas City, Missouri, p 354-359. 4 fig, 3 tab, 5 ref.

Descriptors: *Oxidation lagoons, *Anaerobic conditions, Industrial wastes, Design criteria, Aerobic conditions, Odors, Sludge, Temperature, Climatic conditions, Scum, Waste water treatment, *Louisiana.
Identifiers: *Meat processing wastes, Hog units, Blood, Grease.

Since the early 1960's some 50 slaughterhouse operations in Louisiana have constructed anaerobic lagoon facilities for treatment of paunch manure, blood, fleshing, and other unsalvage by-products. Anaerobic lagoons are mainly popular because of their low initial cost, ability to handle 'shock loads,' and dependable nuisance-free performance. A Houman, Louisiana slaughterhouse already using a lagoon system was evaluated to determine temporary design criteria so that other installations might be constructed. Volume requirements were based on the number of hog units processed per week, with all other animals being measured to equivalent hog units. Lagoon volume is still based mainly upon the number of animals processed per week, but the approximate BOD loading has been found to be 300 lb BOD/acre-ft/day. At this loading, these units have provided satisfactory BOD reductions (from 76.7 to 94.3%) with a minimum of expense. (See also W71-07079) (Lowry-Texas)
W71-07121

CURRENT DESIGN CRITERIA FOR ANAEROBIC LAGOONS,
Burns and McDonnell Engineering Co., Kansas, Mo.
James E. White.
2nd International Symposium for Waste Treatment Lagoons, June 23-25, 1970, Kansas City, Missouri, p 360-363. 4 tab, 12 ref.

Descriptors: *Oxidation lagoons, *Anaerobic conditions, Design criteria, Organic loading, Depth, Temperature, Sludge, Biochemical oxygen demand, Climatic conditions, Odors, Aerobic conditions, Waste water treatment.
Identifiers: Anaerobic lagoons, Meat-processing wastes, Textile wastes, Grease.

Pollution control agencies of the government were surveyed to determine the state of development of anaerobic lagoon design criteria. Industries currently using this type of treatment were also contacted for information on loading rates, BOD removal efficiencies, etc. The information gathered revealed that: (1) none of the states contacted had published design criteria, although many had certain accepted design criteria which they followed, and (2) the industries surveyed responded with such a variety of dimensions for the measurement of organic loading that, unless the data was complete there was no way to compare one with another. The data was seldom complete. From the available literature, and from state and local agencies, it was found that: (1) the majority of states allow loading rates of 12-15 lb BOD sub 5/1000 cu ft/day with considerable variation allowed for climatic conditions, degree of isolation, etc.; (2) lagoon temperature should be above 55 to 60F to provide efficient treatment; (3) depth should be 10 to 15 ft although care should be taken not to contaminate groundwater supplies; (4) series operation of lagoons shows little or no advantage; (5) additional treatment is required for both BOD and nutrient removal before discharge to the receiving water. CHALLENGE FOR WASTE WATER LAGOONS,
Federal Water Quality Administration, Cincinnati, Ohio. Advanced Waste Treatment Research Lab.
Francis M. Middletown, and Robert L. Bunch.
2nd International Symposium for Waste Treatment Lagoons, June 23-25, 1970, Kansas City, Missouri, p 364-366.

Descriptors: *Oxidation lagoons, *Waste water treatment, *Water re-use, Biochemical oxygen demand, Organic loading, Odors, Photosynthesis, Algae, Bacteria, Chlorination, Groundwater, Cost analysis.
Identifiers: Suspended solids.

Increasing use of water has necessitated greater and greater usage of reconditioned waste water as drinking water. With this greater usage has come increasingly stricter laws regarding the quality of the effluent which a treatment facility is permitted to discharge to a receiving water. Therefore treatment methods must become more sophisticated as time goes on in order that effluents not only preserve the quality of a receiving stream, but must help to restore it. In light of these facts lagoon performance must be evaluated with respect to future conditions. Lagoons have several draw backs from a water pollution standpoint. These are: (1) although coliforms may be reduced as much as 98% in a lagoon, the water quality standards for number of organisms per milliliter may still be violated; (2) if algae is allowed to pass to the receiving stream, it may become as much of a pollutional factor as the raw waste since it contains the same amount of organic matter; (3) lagoon effluent is high in suspended solids which are both aesthetically unpleasing and oxygen demanding; (4) lagoons are a threat to groundwater quality because of the difficulty in sealing them. Until now, the most attractive feature of lagoons has been their low cost. As treatment must become more sophisticated, lagoons as presently constructed will need additional treatment which will more than offset their cost advantage. Therefore, unless significant advances are made in lagoon technology, it is doubtful if lagoons will have a place in the future. (See also W71-07079) (Lowry-Texas)

STATE OF THE ART-OXIDATION PONDS,
North Dakota Univ., Grand Forks. Dept. of Microbiology.
John W. Vennes.
2nd International Symposium for Waste Treatment Lagoons, June 23-25, 1970, Kansas City, Missouri, p 366-376. 3 tab, 67 ref.

Descriptors: *Oxidation lagoons, *Waste water treatment, Organic loading, Biochemical oxygen demand, Solar radiation, Nutrients, Temperature, Coliforms, Chlorination, Seepage, Percolation, Evaporation, Insects, Eutrophication, Algae.

An intensive literature search of the waste stabilization pond method of treating waste water was conducted to determine the present status of such units with regard to design criteria, operational parameters, and compliance with water pollution prevention regulations. Design considerations arrived at were: (1) 1 Langley/day of radiation is sufficient to treat 1 lb BOD/acre/day; (2) multi-stage series ponds provide the best organic and bacterial removals; (3) seepage and evaporation must be considered in lagoon design since in many cases these are the only forms of effluent; (4) chlorination while killing the bacteria, will also kill the algae which will then effect an immediate organic load on the system or the receiving stream; (5) algae removal techniques must be developed since most of the organic material is not destroyed, but merely converted to algae, as are the inorganic nutrients as well. Without algae removal, oxidation pond effluent is high in organic content which may cause deterioration of the receiving stream quality. More study is needed on the mechanisms which are utilized in oxidation ponds for the removal of organics, and also on the actual measurement of the organic loadings on the facilities before organic pollutants and micro-organisms present in pond effluents can be reliably predicted. STATE OF THE ART-AERATED LAGOONS,
Kansas Univ., Lawrence. Dept. of Civil Engineering.
Ross E. McKinney.
2nd International Symposium for Waste Treatment Lagoons, June 23-25, 1970, Kansas City, Missouri, p 376-381. 42 ref.

Descriptors: *Oxidation lagoons, *Design criteria, Waste water treatment, Industrial wastes, Temperature, Depth, Mixing, Oxygenation, Organic loading, Biochemical oxygen demand.
Identifiers: *Aerated lagoons, Mechanical aerators, Diffused air, Detention time, Suspended solids.

Aerated lagoons became widely accepted as a form of waste water treatment in the 1960's. Their main application so far has been in the area of industrial waste treatment. Aerated lagoons have successfully treated textile wastes, paper wastes, slaughterhouse wastes, various food wastes, and many others. Because they do not depend upon algae for oxygen, aerated lagoons are more controllable by the operator. Aeration devices have been developed to supply these basins both with mixing capacity and oxygenation capacity. The two basic types in use are mechanical surface aerators, and diffused air devices, each having its own merit. Aerated lagoons have taken a place as an established waste water treatment tool. Much work remains to be done regarding the actual mixing and oxygenation requirements, true loadings, optimum depth, etc. This type of treatment is a combination of both activated sludge and oxidation ponds, and it follows predictably the fundamental kinetics derived for these two processes. When carefully designed, constructed, and maintained, it can provide economical efficient waste treatment for a wide variety of wastes. (See also W71-07079) (Lowry-Texas)
W71-07125

STATE OF THE ART-ANAEROBIC LAGOONS,
South Dakota State Univ., Brookings. Dept. of Civil Engineering.
James N. Dornbush.
2nd International Symposium for Waste Treatment Lagoons, June 23-25, 1970, Kansas City, Missouri, p 382-387. 27 ref.

Descriptors: *Oxidation lagoons, *Anaerobic digestion, Design criteria, Depth, Organic loading, Temperature, Odors, Acidity, Alkalinity, Hydrogen ion concentration, Sludge, Scum, Mixing, Nutrients, Climatic conditions, Methane bacteria, Biochemical oxygen demand.
Identifiers: *Anaerobic lagoons, Detention time.

Anaerobic lagoons have been a natural outgrowth of aerobic lagoons as aerobic systems became overloaded beyond their aerobic capacity. However, facilities which were originally designed to be anaerobic are providing much better treatment. At present, anaerobic lagoons lack a well established well documented set of design criteria based on either field data or theoretical calculations. Therefore, much research is needed to: (1) more clearly define the thermal environment throughout lagoons so that effects of temperature changes may be predicted; (2) arrive at a better effluent and influent; (3) determine the actual detention time of organics within the system; and (4) resolve the question of the relative importance of sludge accumulations as a major source of nuisance odors. A FIELD STUDY OF THE PERFORMANCE OF WASTE STABILIZATION PONDS SERVING SMALL TOWNS,
Kansas State Dept. of Health. Div. of Environmental Health.
Edwin D. Lyman, Melville W. Gray, and John H. Bailey.
2nd International Symposium for Waste Treatment Lagoons, June 23-25, 1970, Kansas City, Missouri, p 387-404. 18 tab.

Descriptors: *Oxidation lagoons, *Waste water treatment, *Rural areas, Organic loading, Biochemical oxygen demand, Chemical oxygen demand, Hydrogen ion concentration, Dissolved oxygen, Sampling, Infiltration, Coliforms, Nutrients, Phosphorus, Nitrites, Nitrates, *Kansas, *Sewage treatment.
Identifiers: Detention time.

Rural areas in Kansas rely on waste stabilization ponds for sewage treatment quite heavily. The reasons for this are low initial cost, because of the relative availability of land; a highly skilled operator is not needed, and when properly maintained, the system has a long working life. Although lagoons are widely used, little knowledge of the performance of such systems was available. Therefore, three such lagoons were chosen for study. Composite samples were taken and analyzed for BOD, COD, NH3, nitrite and nitrate, phosphorus, coliforms, pH, and dissolved oxygen. From the preceding tests, BOD reductions of 85%, COD reductions of 65%, and coliform reductions of 99% were found to be common for Kansas's soil and climatic conditions. With long detention times, an effluent of 100 fecal coliform/100 ml can be consistently obtained. Water quality conditions in Kansas streams indicate that lagoon effluent will enhance overall quality characteristics, as determined from unfiltered samples. Lagoon effluent is currently being used as sole water supply for livestock and irrigation purposes in many areas of the state. Therefore, sacrifice of such effluent quality solely for the removal of inorganic nutrients seems hardly justifiable. (See also W71-07079) (Lowry-Texas)

INVESTIGATIONS OF PHENOLIC WASTE TREATMENT IN AN OXIDATION DITCH,
Instytut Metali Niezelaznych, Gliwice (Poland).
Jan Biczysko, and Jan Suschka.
Proceedings, Third International Conference on Water Pollution Research, Munich, Germany, 1966, Vol 2, p 285-294. 3 fig, 3 tab, 4 ref.

Descriptors: *Phenols, *Trickling filters, Biodegradation, Organic loading, Thermophilic bacteria, Chemical oxygen demand, Dissolved oxygen, Sulfur, Temperature, Microorganisms, *Oxidation lagoons, Waste water treatment.
Identifiers: Oxidation ditch, *Plug flow, Mesophilic, Thiocyanates, Cyanides, Coking plants, Permanganate value, Sludge density.

Oxidation ditch treatment of high temperature phenolic waste streams from a coking plant preceded by a trickling filter, yielded 99.9% decomposition of volatile phenols and 97.7% decomposition of non-volatile phenols. Also, a 92% reduction in permanganate value, 90% reduction of COD, 91.2% and 90% reduction of cyanides and thiocyanates respectively, and 75, 66, and 55% average decomposition of thiosulfates, sulfites and sulfides respectively were observed during the same operation. These results were dependent upon the oxygen concentration being 1.5 mg above. The trickling filter was installed to allow the wastes to cool from the thermophilic to the mesophilic range. Thermophilic organisms in the filter reduced volatile phenols by 30%, cyanides by 50% and thiosulfates by 40%. No excess sludge was produced in this operation, and solids were present in the form of regular, distinct oval flocs which settled readily. From these investigations, future treatment of high temperature phenolic waste streams should be highly efficient if the proper oxygen supply can be maintained. DISCUSSION OF 'INVESTIGATIONS OF PHENOLIC WASTES TREATMENT IN AN OXIDATION DITCH',
Ebara-Infilco Co., Tokyo (Japan).
T. Ide.
Proceedings, Third International Conference on Water Pollution Research, Munich, Germany, 1966, Vol 2, p 295-299. 4 fig, 1 tab.

Descriptors: *Phenols, *Activated sludge, Waste dilution, Dissolved oxygen, Nitrogen, Phosphorus,

ccclimatization, Impellers, Ureas, Hydrogen ion ncentration, *Oxidation lagoons, Waste water eatment.
lentifiers: *Sludge loading, Mixed liquor, Volatile spended solids, Complete mixing, Plug flow, rthophosphoric acid, Sparger, Stocking factory.

n activated sludge process plant for the treatment phenolic wastes has been in operation in Japan nce July 1964. Influent to the system, diluted with nitary wastes and cooling tower water, contains proximately 500 mg/l of phenols. Nutrient trogen and phosphorus are added to the system at e ratio of 4.0 and 0.5 parts respectively, per 100 rts of phenols. Dissolved oxygen concentration is 0 mg/l and pH is 6.7 to 7.3. Phenols removal of an erage of 99.8% have been obtained from this ant. This removal efficiency can be maintained hly as long as the phenol sludge loading factor is ss than 0.6 kg phenol/day/kg VSS. At this value udge production is also negligible. Above this itical loading, however, efficiency gradually ecreases, and excess sludge starts to build up. (See so W71-07128) (Lowry-Texas)

entifiers: Nocardia, Joint clarification, Cyanide, oking plant.

he efficiency of phenol removal was investigated r three different processes. They are: (1) high te biological clarification in an activated sludge ant; (2) biological clarification of phenol-con-ining effluents of a chemical plant with nocardia; d (3) biological clarification of coking plant ef-uent in connection with local sewage in a conven-onal activated sludge plant. The results of these vestigations can be summarized as follows: (1) gh-loading plants should be designed for 1 kg henol/day/cubic meter of clarifier, and 3 kg BOD h 5/cubic meter of clarifier; (2) the single stage ant can provide sufficient treatment; and (3) int clarification with other effluents is both onomically and aquiculturally advisable. he ratio of oxygenation to the loading BOD sub hour is a better indication of purification in an idation ditch than the maintenance of a certain ssolved oxygen concentration at a certain posi-n in the ditch. Research analyzed in this way ows wide variation in the oxygen management of o different systems even when the dissolved ox-en levels are essentially the same. This difference in measurement can also cause considerable error in COD measurement and result in misleading and inaccurate information. (See also W71-07128) (Lowry-Texas)

FUNDAMENTAL PRINCIPLES OF SEWAGE CHLORINATION,
Robert A. Taft Sanitary Engineering Center, Cincinnati, Ohio.
Chester E. Rhines.
Proceedings, Industrial Waste Conference, 21st, Mar 1966, Purdue University, Vol L, No 2, p 673-678. 4 tab, 3 ref.

Descriptors: *CHLORINATION, *Disinfection, Oxidation, Pathogenic bacteria, Sewage bacteria, Viruses, Coliforms, Aeration, Nitrites, Reduction (Chemical), Alkalinity, Biodegradation, Activated sludge, Waste water treatment.
Identifiers: Contact time, Clarification, Most probable number.

Chlorination has long been accepted for the disinfection of drinking water. Attempts at applying chlorination to raw sewage, however, have met with little or no success. Chlorine disinfection requires three conditions for efficient disinfection: (1) the chlorine must come in contact with the organism; (2) although disinfection will proceed in alkaline conditions, it does so at a much reduced rate, whereas in an acidic environment it is extremely active; and (3) lower temperature reaction conditions must be compensated for by increased contact time. The major hindrances to efficient disinfection can be removed through proper bio-oxidation and the clarification made possible for good bio-oxidation processes. Conversion of nitrogenous compounds to the nitrate form, and removal of large or clumped parasites, in addition to elimination of reducing substances and oxidation of toxic substances are all objectives accomplished by efficient bio-oxidation. From the above analysis, it is obvious that the failure of chlorine to provide adequate disinfection is largely a result of either inefficient or superficial bio-oxidation which can actually produce intermediate oxidation products which are detrimental to the disinfection process, such as nitrite nitrogen. THE BIOCHEMISTRY OF ANAEROBIC DIGESTION,
Manhattan College, Bronx, New York. Civil Engineering Department.
John S. Jeris, Richard Schneeman, Cheng-nan Weng, Robert Gasser, and Yi-siung Su.
Available from the National Technical Information Service as PB-198 655, $3.00 in paper copy, $0.95 in microfiche. Final Report, 1970. 140 p, 23 fig, 9 tab, 45 ref, 6 append. EPA-WQO Research Grant 17070 DFK.

Descriptors: *Anaerobic digestion, *Methane bacteria, *Sludge digestion, Biodegradation, Sludge disposal, Waste water treatment, *Tracers, Radioactivity techniques, *Acids, Organic acids, *Digestion.
Identifiers: Acid degradation, Lactic acid, Propionic acid, Succinic acid.

This investigation sought to determine biochemical mechanisms in the anaerobic degradation of typical organics found in wastes by means of radioactive tracer techniques. Two liter laboratory scale digesters were used in all the radioactive tracer work. Substrate and nutrients were slug fed daily while carbon-14 compounds were slug fed one time or daily depending on the type of study being performed. Chemical analyses of the liquid feed and effluent were routinely performed along with identification of gaseous end products. Radioactivity analyses on the gases produced were conducted using liquid scintillation techniques. The degradation of propionic, succinic and lactic acids appear to be closely related with common intermediates. Propionic acid can be degraded through lactic or succinic acids and the reverse is true for each of the other two compounds. Propionic acid may also be metabolized by alpha or beta-oxidation giving rise to an intact methyl group in the methane formed, from either the number two or three carbon. A pathway for glutamic acid utilization was postulated involving the formation of two moles of acetic acid for each mole of substrate used. Oleic acid was primarily degraded by beta-oxidation. In the fermentation of benzoic acid, three moles of acetic acid were produced per mole degraded and the number one carbon was primarily converted to methane. (Bunch-EPA-WQO)
W71-07136

THE ECONOMIC FEASIBILITY OF ESTABLISHING AN IRRIGATED FORESTRY ENTERPRISE ON THE HANFORD RESERVATION, WASHINGTON,
Battelle Memorial Inst., Richland, Wash. Pacific Northwest Labs.
Bruce W. Cone.
Research Report YR 9341, Nov 1970. 43 p, 1 fig, 10 tab, 68 ref.

Descriptors: *Resource development, *Fiber crops, *Economic feasibility, *Forestry management, *Trees, Probability, Harvesting, Pulp and paper industry, Return (Monetary), Washington, Access routes, Nuclear reactors, Water supply, Irrigation water, Deserts, Arid lands, Humidity, Air temperature, Ornamentals, Plant growth, Crop production, Softwood, Lumber, Saw mills, Irrigable land, Economic prediction, Consumptive use, Water reuse.
Identifiers: Hanford Reservation (Washington), Calculated risk, Atmospheric factors.

Water discharged from reactors and processing plants, temperate climate, and controlled access may provide the residues to sustain a forest on the Hanford Reservation, Washington. The reservation is in a desert, where the relative humidity falls to 6%, and the temperature rises to 115 degrees. Some tree species survive in a few isolated areas as the remains of an older irrigated agriculture. To determine the economic feasibility of irrigating trees, available land, water and atmospheric factors are initially assessed. Estimates are made on the quantity of wood fiber which could be produced with a given water quantity. Finally, net returns on the most promising irrigated species (Ponderosa pine, Douglas fir, Poplar and Sycamore) are evaluated. Irrigated ornamentals also show considerable growth. The analysis concludes that it is economically feasible to establish an irrigated cottonwood or sycamore forest, providing the trees are mechanically harvested every 5 years, and the chips are used in an adjacent pulp mill. Net annual returns from cottonwood and sycamore are estimated at $23.52 and $45.54 per acre. Forest establishment under these circumatances is a calculated risk, where there is an 88% probability that present value of the cottonwood enterprise would be greater than O, and an 85% probability that it would exceed O from a sycamore enterprise. (Popkin-Arizona)

WATER-SEWER AND DRAINAGE PLAN FOR FORT SMITH URBANIZING AREA-PHASE II.
Arkhoma Regional Planning Commission, Fort Smith, Arkansas.

Available from the National Technical Information Service as PB-195 690, $3.00 in paper copy, $0.95 in microfiche. Arkhoma Regional Planning Commission, Fort Smith, Arkansas, June 1970. Volume II, 232 p, 7 fig, 6 tab. HUD Project No Ark P-105.

Descriptors: *Sewers, *Sewage treatment, *Drainage systems, *Urbanization, *Planning, Waste water, Waste water treatment, Water quality control, Sewerage, Municipal wastes, Water pollution, Sewage lagoons, Oxidation ponds, Sanitary engineering, Financing, Capital costs, Arkansas, Oklahoma.

Identifiers: *Regional sewer systems, *Fort Smith, Arkansas River.

A unified sanitary sewer system is recommended to serve the urbanizing area of Fort Smith which includes communities in both Arkansas and Oklahoma. Of the ten communities in this area, only Fort Smith, Van Buren and Alma have public sewer systems and public sewage treatment facilities. The others which range in population from 200 to 2,000 persons are served through individual septic tanks. It is estimated that the population will increase from the present 97,150 to 198,000 by 1990. Large distances between growth centers and a diversity of drainage areas impede the development of a unified areawide sewerage system and central disposal facilities. Sewage lift stations will be required to conduct flows to the Arkansas River to avoid constructing lengthy sewer lines. The river separates the urbanizing area into two parts. This dictates that two systems of interceptor sewers should be built paralleling the stream. It is recommended that two activated sludge sewage treatment plants be built downstream from the urbanizing area, one on each side of the river. Areawide requirements to facilitate connecting even the smallest residential developments to interceptor sewers when feasible are recommended. Interim sewage treatment facilities involving stabilization ponds or package plants are suggested until connections can be made to future interceptor sewers. Design criteria, capacity requirements, construction and operating costs, user charges, legislative needs, financing, cost sharing, existing system deficiencies, recommended improvements, and storm drainage needs are discussed. (Poertner)

A STUDY OF LOCAL NEEDS FOR WATER POLLUTION CONTROL FACILITIES IN FISCAL YEARS 1971-76.
National League of Cities, Washington, D.C.; and United States Conference of Mayors, Washington, D.C.

Reprinted in Congressional Record (Senate), Feb 10, 1971, p S1266--S1273. Feb 1971. 9 p, 2 tab.

Descriptors: *Water pollution control, *Waste water disposal, *Waste water treatment, *Drainage water, *Treatment facilities, *Investment, Urbanization, Cities, Municipal wastes, Estimated costs, Sewers.
Identifiers: *Capital requirements, Nationwide survey.

An extensive nationwide survey was made in 1970 of the capital requirements for constructing and improving local water pollution control facilities during the next six years. This information was requested of the National League of Cities and the United States Conference of Mayors by Senator Muskie of the Senate Public Works Committee. The survey covered 1,105 cities, counties and independent sewage treatment agencies serving a combined population of approximately 95 million persons. These communities identified needs of $21.7 billion. The survey also estimated that, based on a 5-percent inflation factor and the fact that 45 to 55 million of those persons served by sewers were not covered by the survey, total needs for public expenditures for clean water facilities during the next few years are in the range of $33 to $37 billion. The needs were separated into three categories in the mailed survey questionnaire. The needs reported were as follows: (1) primary and secondary treatment facilities, $9,311,987,574; (2) tertiary treatment facilities, $4,100,386,533; (3) interceptor and storm sewer improvements, $8,368,738,149. A significant portion of the needs reported were for interceptor sewers which are currently eligible for federal aid. Two tables are included which list the capital needs in each of the three categories. One table is a listing by states, and other a listing by individual jurisdictions within states. (Poertner)

THE SOUTH LAKE TAHOE WATER RECLAMATION PROJECT,
Hill (Clair A.) and Associates, Redding, Calif.
Harlan E. Moyer.
Public Works, Vol 99, Dec 1968, p 87-94. 7 fig, 1 tab.

Descriptors: *Water reuse, *Tertiary treatment, *Waste water treatment, *Waste water disposal, *California, Water utilization, Irrigation programs, Irrigation water, Pipelines, Pumping plants, Sewage treatment, Water pollution control, Water pollution treatment, Pumping, Water quality, Lake basins, Eutrophication, Financing, Sanitary engineering, Hydraulic engineering, Engineering structures.
Identifiers: *Lake Tahoe, *Indian Creek Reservoir, South Lake Tahoe, South Tahoe Public Utility District.

The planning, design, construction, financing and operation are described of a 28 million dollar water reclamation complex at the south shore of Lake Tahoe. The Lake Tahoe basin covers an area of 506 square miles, 192 of which comprise the Lake. The basin lies in California and Nevada and spreads through five counties and 65 local, state and federal agencies. A 2 1/2 mgd tertiary treatment plant was completed in 1965 to treat the effluent from the existing activated sludge plant. The primary, secondary and tertiary facilities were enlarged to 7 1/2 mgd by 1968. The process utilizes chemical coagulation, filtration through multimedia filters, ammonia stripping for nitrogen removal, and adsorbtion on activated carbon columns. Effluent, formerly used in spray irrigation of land in the basin, is now pumped through a 27 mile long pipeline constructed from the treatment plant at South Lake Tahoe to Indian Creek Reservoir. The reservoir was constructed to accept all of the effluent from the South Tahoe tertiary plant. It can store 3,225 acre-feet of reclaimed water which is used for irrigation purposes in Alpine County, California. The effluent is essentially of drinking-water quality. The reason for exporting the effluent from the Lake Tahoe Basin is to prevent any possible enrichment of Lake Tahoe waters by effluent nutrients. The plant is said to be the most advanced water reclamation facility in the world. (Poertner)

WATER AND SEWER PLAN AND PROGRAM, 1970.
Metropolitan Washington Council of Governments, D.C.

Available from National Technical Information Service, as PB-196 637, $3.00 in paper copy, $0.95 in microfiche. Sept 1970. 126 p, 14 fig, 9 tab, 88 ref. HUD Project No D C P-12.

Descriptors: *Water supply, *Water quality control, *Waste water treatment, *Water conveyance, *Planning, District of Columbia, Virginia, Mayland, Water resources, Water resources development, Urbanization, Cities, Water demand.
Identifiers: *Potomac River, *Metropolitan Washington, Water and sewer plan, Metropolitan planning.

This report updates an earlier report, 'Water and Sewerage Facilities Planning and Programming for the Washington Metropolitan Area' prepared in 1969. It identified the existing problems and concerns; documents the progress made recently; and discusses the existing national, state and regional goals, objectives and policies regarding water and sewer facilities. A regional water and sewer plan and a short range program for the 1970-76 period are outlined. Future water and sewer policies for the region are also recommended. Growing concern is cited over the water quality of the Potomac River and Estuary along and with the need for interrelated metropolitan and basinwide planning. Critical overflows in certain sewer systems and the need for providing, expanding and implementing waste water treatment plants are some of the other concerns identified in this report. The most critical need of sewage treatment in the metropolitan area is the immediate upgrading of the Blue Plains Water Pollution Control Plant. The most vital problem of regional water supply is the low flow in both the Potomac and Patuxent Rivers during summer months. Construction of additional upstream reservoirs on the Potomac River is a critical need. One of the major concerns in water distribution within the metropolitan area is the increasing complexity of water management brought about by the demand for expansion of distribution facilities. The Potomac River is considered the best source of water supply; however, recommendations are made to explore alternate sources including water water reclamation. The water demand is expected to increase from 380 mgd in 1970 to 1,050 mgd in the 1990's. (Poertner)

TEMPERATURE EFFECTS ON BIOLOGICAL WASTE TREATMENT PROCESSES,
Vanderbilt Univ., Nashville, Tenn.
W. Wesley Eckenfelder, Jr., and A. J. Englande.
Waste Water Conference, University of Alaska, June 1970.

Descriptors: *Temperature, *Waste water treatment, *Aerobic treatment, *Activated sludge, Lagoons, Dissolved oxygen, *Biological treatment, Biomass, Biochemical oxygen demand, Microorganisms, Bacteria, Sewage bacteria, Thermophilic bacteria, Water pollution, Thermal pollution, *Oxidation lagoons.
Identifiers: Temperature effects.

The temperature effect on the biological processes taking place in waste stabilization ponds, activated sludge tanks and aerated lagoons is discussed. The comparison uses a modification of the Van't Hoff-Arrhenius equation from which the thermal coefficient, theta, is calculated. It was found that temperature effects are minimal on activated sludge process performance as compared to other treatment systems. The low sensitivity of the activated sludge process is primarily due to the low F/M ratio which results in biological growth. Waste stabilization pond, aerated aerobic-facultative lagoon, and anaerobic pond processes operate at a lower solids level and/or a higher F/M ratio. Because of the dispersion of the biomass within these systems, the process is more directly affected by variation in temperature. (Novotny-Vanderbilt)

EVALUATION OF ADVANCED TREATMENT PROCESSES FOR IMPROVING PLANT PERFORMANCE,
North Carolina Univ., Chapel Hill, Dept. of Environmental Sciences and Engineering; and North Carolina Univ., Chapel Hill. Sanitary Engineering and Water Resources Program.
James C. Lamb, III.
Waste water Research Center Report No 12, 1970. 9 p, 6 ref.

Descriptors: *Evaluation, *Waste water treatment, *Water purification, *Design, *Technology, Biochemical oxygen demand, Nitrogen, Phosphorus, Biological treatment, Activated carbon, Distillation, Electrodialysis, Reverse osmosis, Potable water, Organic compounds, Inorganic compounds.

The gap between research pertinent to waste water treatment and technology applied in the field and design is discussed. Together with suggestions for enhancement and extension of existing processes attention is called to the recent overemphasis o

ıste water treatment and inadequate attention to ıter supply and treatment of municipal water. eatment employed in municipal practice does t reduce the concentration of 40 out of 50 im-ortant constituents. This is particularly true of emicals which contribute to the carbon-loroform extract and many pesticides. The use of tivated carbon and other new technology ethods could enhance the quality of the mu-cipal water supply. Recent suggestions are also entioned about the possibilities of obtaining a table water supply from relatively uncon-minated sources and establishing two or more ıter distribution systems in a municipality. dimentation basins were assumed to be presented by a system consisting of: (1) stagnant dead regions, (2) isotropic small-scale, moving dy systems, (3) macroscopic recirculation stems. Flourescent tracer studies supported this sumption, with the result that non-ideal sedimen-tion basins were characterized by their flow-net urves. Quiescent column studies were then per-rmed to determine critical settling velocity. ese studies established the settling depth as a eful criterion for determining basin performance, eration, and for making comparative analyses. his parameter can also be used as a measure of the fectiveness of an established system to treat a w waste, and the efficiency with which spended matter will be removed. All of the above vestigations aided in establishing a nearly linear rrelation between hydraulic efficiency as presented by the hydraulic characteristic criteria, and removal efficiency. DISCUSSION OF 'HYDRAULIC AND REMOVAL EFFICIENCIES IN SEDIMENTATION BASINS,'
Birmingham Univ. (England).
M. J. Hamlin.
Proceedings, Third International Conference on Water Pollution Research, Munich, Germany, Vol 2, p 404-408, 1966. 4 fig, 6 ref.

Descriptors: *Settling basins, *Sedimentation, *Density currents, Flocculation, Turbulence, Tracer, Suspensions, Efficiencies, Sampling, Baffles, Weirs, Waste water treatment.
Identifiers: *Flow-through curves, Model tanks, Suspended solids, Quiescent.

The mechanics of sedimentation basins have never been fully understood because of their complexity and the number of variables they contain which cannot be duplicated. Even in model tanks, simplifying restrictions must be made to enable any progress to be made. Density currents are present in sedimentation tanks and current research yielded the following results: (1) density current velocity is independent on flow rate; (2) effluent quality does not deteriorate significantly with increasing flow within the limits of flow of the experiment; (3) no conclusive evidence has been obtained as to the relative efficiencies of narrow tanks versus wide tanks; and finally, the most consistent results were obtained using a drowned weir. Much work remains to be done on isolation techniques needed for future experiments. (See also W71-07362) (Lowry-Texas)

FORMAL DISCUSSION OF 'HYDRAULIC AND REMOVAL EFFICIENCIES IN SEDIMENTATION BASINS',
Alexandria Univ. (Egypt).
Hassan El-Baroudi.
Proceedings, Third International Conference on Water Pollution Research, Munich, Germany, Vol 2, p 395-399, 1966. 2 fig, 6 ref.

Descriptors: *Settling velocity, Efficiencies, Turbulence, Tracer, Dispersion, Flocculation, Sedimentation, Waste water treatment.
Identifiers: Hydraulic properties, *Geometric configuration, *Critical settling depth, Critical settling time, Ideal mixing, Detention time.

The problem of relating particle removal to hydraulic and geometric properties of a settling tank has not yet been solved. Critical settling depth for each geometric configuration must be determined by trial and error. Predicted and actual removal efficiencies have been in good agreement for certain geometric configurations, but universal application to all configurations and different floc types is impossible. Critical settling time, can replace the critical settling depth as follows: (1) plot total removal versus settling time in a quiescent tube, and average removal will take place at the critical settling time, T sub c, if there is one; (2) compute ideal removal from theoretical detention time T sub 1; (3) from the removal versus settling time plot, find the critical removal R sub c corresponding to T sub c; (4) take the ratio of T sub c to T sub 1 to be the criterion of tank performance, zero for mixing tanks and 1.0 for ideal tanks. Using this information in conjunction with the tracer dispersion curves formulated by Villemonte, Rohlich, and Wallace, the idea of deducing T sub c from dispersion curves can be accurately tested. DISCUSSION OF 'HYDRAULIC AND REMOVAL EFFICIENCIES IN SEDIMENTATION BASINS',
Johannesburg (South Africa).
E. J. Hall.
Proceedings, Third International Conference on Water Pollution Research, Vol 2, Munich, Germany, p 399-403, 1966. 4 fig, 5 ref.

Descriptors: *Mixing, *Flocculation, Suspension, Efficiencies, Settling velocity, Temperature, Flow-net, Dispersion, Waste water treatment.
Identifiers: Hydraulic characteristics, Critical settling depth.

Critical settling depth ratio has application, at best, to specific temperature and suspended solids concentration. Even in this restricted range, previous work has demonstrated that while a broad general pattern may be reproduced, a given specific flow pattern in either a rectangular or circular basin cannot be faithfully reproduced. Further, when a suitable set of settling curves cannot be obtained, the method cannot be applied at all. Results of studies made in the field have shown solids removals far in excess of the theoretically predicted maximum. This phenomenon has been attributed to the flocculent characteristics of settling sewage. These results do not support the contention that column settling curves typify the settling characteristics of a particular basin. Ideal flow in a basin, for maximum solids removal does not conform to a classical idea of non-dispersed plug flow, since control of turbulence can aid flocculation and thereby enhance removal. In summation, the concept of critical settling depth can have no real meaning in the case of sewage settlement, largely because settled sewage exhibits the property of auto flocculation, and the rate of flocculation is dependent on the character and degree of mechanical mixing applied. PHOTO-FILM INDUSTRY WASTES: POLLUTION EFFECTS AND ABATEMENT,
Central Public Health Engineering Research Inst., Nagpur (India).
G. J. Mohanrao, K. P. Krishnamoorthi, and W. M. Deshpande.
Proceedings, Third International Conference on Water Pollution Research, Munich, Germany, Vol 1, p 181-198, 1966. 4 fig, 12 tab, 9 ref.

Descriptors: *Ammonium compounds, *Toxicity, *Chemical precipitation, Chemical wastes, Bioassay, Acclimatization, Chemical oxygen demand, Biochemical oxygen demand, Color, Hydrogen ion concentration, Dissolved oxygen, Activated sludge, Waste water treatment.
Identifiers: Photo-film industry wastes, Laboratory effluent, TL sub m (test concentration at which fish mortality was 50%), White water, Emulsion washwater, Hydroquinone, Metol, Synergistic, Antagonistic, Alum coagulation, South India.

Tests indicated that the effluent from a proposed photo-film manufacturing plant would be toxic to fish in the receiving waters. The effluent was composed of waste waters from three different sources. In order of descending toxicity, these are the laboratory effluent, the emulsion washwater, and the white water. The TL sub m values for these effluents are 1, 5, and 10% by volume respectively. A mixture of these wastes, composited in the relative amounts in which they would be manufactured, had a TL sub m value of 5%. The wastes were toxic to biological treatment of the conventional type, but, it was found that a biological system could become acclimated to the wastes after the wastes had been treated with a coagulant. The effluent obtained after treatment of the composite sludge with 500 mg/l of alum could be handled further on an activated sludge plant after mixing with the available domestic sewage (5:3, photowaste;sewage) producing an innocuous effluent at low BOD and COD. DEGRADABLE POLLUTANTS-A STUDY OF THE NEW DETERGENTS,
California University, Berkeley. Sanitary Engineering Research Lab.
P. H. McGauhey, and Stephen A. Klein.

Proceedings of the Third International Conference, Munich Germany, Vol 1, p 353-364, 1966. 4 fig, 4 tab, 8 ref.

Descriptors: *Alkyl benzene sulfonates, *Linear alkylate sulfonate, Aesthetics, Frothing, Colorimetry, Tracers, Biodegradation, *Detergents, Biological treatment, Waste water treatment.
Identifiers: *Alcohol sulfate, *Radioassay, Foamability, Pilot experiments, Livermore, California, Sewage Treatment facility of the Sanitary Engineering Research Laboratory, California, University.

Alkyl benzene sulfonates have been loudly denounced by the American public on account of their tendency to cause foaming problems in receiving streams which are aesthetically unpleasing. Linear alkylate sulfonate has now been substituted by the detergent industry as their new synthetic surfactant, and these tests were conducted to determine whether or not additional treatment facilities will be required. The results or monitoring studies of two treatment plants during the ABS to LAS change over specifically indicate that the change over will not reduce the necessity for a high degree of treatment. Where such a high degree of treatment exists, and the effluent is diluted to a large extent, no further foaming problems should be encountered. In instances where there is little or no dilution of the waste, and/or there is no secondary treatment, then improved facilities must be constructed to adequately handle the problem. In most instances, however, sewage treatment adequate to meet the aesthetic and other objectives of water quality control, the detergent fraction of the waste will be removed satisfactorily without special treatment processes. WASTE TREATMENT AT THE RATH PACKING COMPANY,
Rath Packing Co., Waterloo, Iowa.
M. J. Andera, G. R. Foss, and H. A. Brandeland.
Proceedings, Industrial Waste Conference, 21st, Purdue University, Vol L, No 2, p 52-55, Mar 1966.

Descriptors: *Waste water treatment, *Industrial wastes, Municipal wastes, Sewage, Water use, Biochemical oxygen demand, Iowa.
Identifiers: *Meat packing wastes, Waterloo (Ia).

The waste water control program of the Rath Packing Company has mainly been one of education and elimination. All of the waste effluent from the plant, with the exception of sanitary wastes, is pre-treated in settling basins for removal of grease and sludge before being sent to the municipal waste water treatment plant. The main emphasis of the control program has been reduction of total waste flows through careful monitoring of waste streams and total water usage. Foremen in each of the areas were instructed, first as to how much water they were actually using, and secondly, how to eliminate or reduce water requirements for washing etc. As a result, some waste streams were segregated, leaving others clean enough to be utilized again as washwater, significantly reducing water usage. With a daily flow of 4.5 MGD, 500 to 1,000 lbs of grease are lost per day, but recovery above this level is unfeasible economically. However, the measurement of this and other pertinent parameters demonstrates the need for a well-equipped laboratory for efficiency evaluations and other development work. The key, both to laboratory and plant efficiency in pollution control, however, is education of key personnel to the responsibilities of waste water control, and the expensive consequences of neglect. THE ROLE OF ENZYMES IN THE CONTACT STABILIZATION PROCESS,
Illinois Univ., Urbana.
Rashid H. Siddiqi, R. S. Engelbrecht, and R. E. Speece.
Proceedings, Third International Conference on Water Pollution Research, Munich, Germany, Vol 2, p 353-380, 1966. 8 fig, 13 ref.

Descriptors: *Activated sludge, *Kinetics, *Stabilization, *Enzymes, Synthesis, Respiration, Metabolism, Storage, Catalyst, Acclimatization, Infiltration, Hydrolysis, Adsorption, Organic loading, *Waste water treatment.
Identifiers: *Contact stabilization, *Inducible, *Constitutive, *Permease, Food to microorganism ratio, Overoxidation, Endogenous metabolism, Substrate, Activity, Langmuir adsorption isotherm.

Previous research has stated that the rate of uptake is directly proportional to substrate concentration. However, it was demonstrated in this research that exogenous soluble organic matter is transported by enzymes into the bacterial cell, and that this rate of removal can be saturated by increasing the food to microorganism ratio. Therefore, utilization of a complex waste, containing both suspended and dissolved organic matter, for studying the mechanism and kinetics of initial uptake of soluble organic matter produces erroneous results. Initial increases in removal capacity can now be attributed to the production of synthesis and respiration enzyme systems. In the same manner, decreases in removals are accounted for by the inactivation of the enzyme systems. A thorough account of the mechanisms of the enzyme systems is presented here. From this and further work, it is hoped that design and operation of contact stabilization waste water treatment processes can be more clearly defined in the interest of greater economy and efficiency. (See also W71-07372 and W71-07373) (Lowry-Texas)

DISCUSSION OF 'THE ROLE OF ENZYMES IN THE CONTACT STABILIZATION PROCESS',
Texas Univ., Austin.
Davis L. Ford, and W. Wesley Eckenfelder, Jr.
Proceedings, Third International Conference on Water Pollution Research, Munich, Germany, Vol 2, p 368-371, 1966. 4 fig, 7 ref.

Descriptors: *Kinetics, *Metabolism, Adsorption, Stabilization, Oxidation, Colloids, Activated sludge, *Waste water treatment.
Identifiers: *Contact stabilization, Uptake site saturation, Over-oxidation, *Inactivation, Dehydrogenase, Activity, Enmeshment, Substrate, Endogenous respiration, Brewery waste.

'Uptake site saturation' is the limiting factor in biological metabolism, rather than substrate concentration. This phenomenon is known as permease saturation. Above a certain F/m ratio, biological systems are independent of substrate concentration. Uptake mechanisms and kinetics can best be observed through the use of pure culture, although the same general conclusions can be drawn from data obtained from a complex filtered waste. Basic initial uptake concepts persist, but rates and characteristics of the mechanics change from waste to waste and laboratory investigations of individual wastes must be performed. W71-07372

DISCUSSION OF 'THE ROLE OF ENZYMES IN THE CONTACT STABILIZATION PROCESS',
Stanford Univ., Calif.
Perry L. McCarty.
Proceedings, Third International Conference on Water Pollution Research, Munich, Germany, Vol 2, p 372-376, 1966. 2 fig, 1 tab, 1 ref.

Descriptors: *Enzymes, *Biodegradation, Microorganisms, Bacteria, Metabolism, Adsorption, Toxicity, Infiltration, Flocculation, Activated sludge, *Waste water treatment.
Identifiers: *Contact stabilization, Contact time, Piston flow, Plug flow.

Some of the advantages of the contact stabilization process are that it requires a smaller aeration tank volume, and the stabilizing sludge offers a reserve to be drawn upon in the case of toxic wastes. However, several disadvantages are also inherent to this system. The most important of these is the phenomenon of inducible enzyme inhibition. Loss of the inducible enzymes stops biological activity. These new facts about the operations of contact stabilization versus completely mixed activated sludge necessitate a thorough study of the nature of the waste to be treated before an intelligent judgement can be made. FLUID-CARBON COLUMNS FOR SORPTION OF RESISTENT ORGANIC POLLUTANTS,
Michigan Univ., Ann Arbor. Dept. of Civil Engineering.
Walter J. Weber, Jr.
Proceedings, Third International Conference on Water Pollution Research, Munich, Germany, Vol 1, p 253-276, 1966. 10 fig, 3 tab, 17 ref.

Descriptors: *Activated carbon, *Adsorption, *Saturation, Competition, Heterogeneity, Fouling, Temperature, Hydrogen ion concentration, Waste water treatment.
Identifiers: *Fluid-carbon column, *Packed carbon column, Binding, Capacity, Particulate, Concentration, Transport mechanism, Breakthrough, Acidification, Ultraviolet adsorption, Langmuir adsorption isotherm.

Fluid-carbon contact chambers showed no increased head loss after 16 days, whereas the packed carbon column of 1.83 meter depth was clogged completely within a few hours. Packed carbon columns have a tendency for the carbon particles to adhere to each other, thus clogging the column. Factors influencing performance of fluid carbon contactors are: (1) molecular weight of adsorbate, when two or more are mixed, (2) competition for adsorption between the components of heterogeneous solution, and (3) pH may sometimes enhance removal is adjusted to an optimum level, although this is not always a significant factor. Fluid-carbon columns were demonstrated to have very high adsorption capacities. Packed carbon columns may adsorb 15-20% by weight when adsorbing coarse particles, whereas fluid-carbon columns have attained capacities of up to 40% by weight in heterogenous solutions. TREATMENT OF ANIMAL WASTES AT THE GREENFIELD LABORATORIES OF ELI LILLY AND COMPANY,
Eli Lilly and Co., Greenfield, Ind.
Thomas W. Bloodgood.
Proceedings, Industrial Waste Conference, 21st, Purdue University, Vol L, No 2, p 56-61, May 1966. 1 tab, 1 ref.

Descriptors: *Waste water treatment, *Animal wastes, *Farm wastes, Lagoon, Aeration, *Indiana, Trickling filter, Laboratories, Baffles, Biochemical oxygen demand, Toxicity.
Identifiers: Laboratory wastes, Toxicology, Clarifier, Imhoff tank, Greenfield (Ind), Eli Lilly and Company.

Since the initial installation of Eli Lilly and Company's plant at Greenfield, Indiana, $405,000 have been spent on 5 separate waste treatment facilities mainly for the wastes of the laboratory animals used for testing and culturing of serums and antitoxins. Plant 238 consists of a baffled lagoon, half aerated and half quiescent. A 275 cfm blower is used to aerate the wastes of approximately 240 ca

and 250 sheep. There is much loss due to page, and little surface effluent. Influent BOD 5 of approximately 225 mg/l is reduced to approximately 75 mg/l. Plants 237, 236, and 226 all ploy modifications of the activated sludge cess. Solids are screened from the influent and posed of by a firm under contract with Lilly and mpany for that purpose. Flows entering these nts originate from chickens, swine, and small oratory animals such as rabbits, monkeys, nea pigs, hamsters, mice, dogs, cats, and rats. Int BOD's range from 100 to 510 mg/l, and efnts average 75 mg/l. Plant 219 is a primary tment plant consisting of primary clarification, rge tank clarifier and an Imhoff tank used as a ester. A 22 ft diameter high rate trickling filter a final clarifier provide secondary treatment. influent averages 80,000 gpd with a BOD of mg/l. Effluent BOD averages 35 mg/l. These nts are operated by two men, one a Class D rator. Total operating costs are approximately ,000 per year, excluding utilities. (Lowry-Tex-

ntifiers: Metal machining, Chips, Clarifier, cdo (Ohio), Dana Corp.

ustrial wastes produced from metal machining rations at the Toledo, Ohio plant of the Dana rporation include soluble oil, synthetic machin- coolants, metal cleaning compounds, plating other chemical materials, and washer inings. Prior treatment facilities included a cen- collection header, from which all waste streams re pumped to a 2.5 million gallon reservoir and wed to separate by gravity. Increased flows and her levels of toxic waste materials necessitated dating of the treatment facilities. A three stage tment facility was designed. A 75,000 gallon alization tank is used to permit gravitational aration of 'free' oils and chemical equalization various agents. The wastes then pass through an ustable weir box which provides a constant outv. At the V-notch outfall of this weir box, floc- ation chemicals are added to take advantage of ing through turbulence. The wastes then flow a clarifier, and the pH is decreased sufficiently produce degradation of solubilizing agents, and mical neutralization of soaps and other emulers. In tank B, small additions of lime are made enhance flocculation, ferric sulfate is added to duce an acid attack on residual synthetic emulers, and Purifloc 'A' is added as a flocculent aid. the C-tank, or accelerator, lime adjustment of brings the pH to 8.0, an ideal point for release. blems encountered are attributed mainly to al chips which clog lines and cause increased mp wear. Methods of removal of such chips are ng studied, but, at present, two 25,000 gal. rage tanks are used for holding basins during akdowns. (Lowry-Texas)

COVERY OF EDIBLE AND INDUSTRIAL ODUCTS FROM EFFLUENT STREAMS OF TATO PROCESSING PLANTS,
d River Valley Potato Processing Lab., East and Forks, Minn.
Shaw.
ceedings, Industrial Waste Conference, 21st, y 3, 4, 5, 1966, Purdue University, Vol L, No 2, rch 1966, p 13-18. 1 tab, 11 ref.

Descriptors: *Potatoes, Distillation, Microbiology, Economics, Foods, Alcohol, Effluent, *Water reuse, *Waste water treatment.
Identifiers: *Potato wastes, Starch, Edible products, *Poland.

The ever increasing volumes of waste materials, and the subsequently increasing cost of waste water treatment has caused much interest in recovery and profitable use of potato processing by-products which were formerly discharged directly to waste streams. The candidate process of greatest promise is the vertical integration of the potato industry. The potato industries of Poland and the USSR are presented as examples. In Poland, potatoes are used for four main purposes: alcohol, starch, food products, and animal feed. All by-products, except those of starch, are completely utilized. Recent developments in uses of potatoes in combined alcohol and starch plants have ennabled Russian industries to utilize a total of 95.5% of the total raw potato input. In Eastern Europe, where protein nitrogen and vitamins are in short supply, potato mash provided an excellent culture medium, thereby lessening disposal problems and increasing profit per unit. Methods and procedures followed in Eastern Europe may be at least partially applicable to potato processors in the United States. Vertical integration of the potato industry to include horticulture, distillation, and microbiology, along with increased marketing technology may well aid in the development of even better potato products with significant savings both in processing and treatment. (Lowry-Texas)

THE EFFECT OF INLET CONDITIONS ON OIL-WATER SEPARATORS AT SOHIO'S TOLEDO REFINERY,
Clemson Univ., S.C. Dept. of Civil Engineering.
A. T. Wallace, G. A. Rohlich, and J. R. Villemonte.
Proceedings, Industrial Waste Conference, 21st, Purdue University, Vol L, No 2, p 618-625, March 1966. 8 fig, 1 tab, 2 ref.

Descriptors: *Oily water, *Separation techniques, *Dispersion, Orifices, Baffles, Jets, Weirs, Diffusion, Mixing, Oil, *Oil wastes, *Ohio, Waste water treatment, Oil-water interfaces.
Identifiers: *Oil-water separators, Inlets, Sohio, Toledo (Ohio).

Dispersion curves were obtained for two experimental basins differing only in inlet design. Oil removals, obtained by the two basins were measured at comparable flow rates. To obtain the dispersion curves, adjustable inlet gates were set at the appropriate gauge reading and the basin was allowed to operate for one full detention time to stabilize. Dye tracers were injected, and the basins were compared at separator overflow rates of 500, 1000, 2000, and 4000 gallons sq ft/day. From the previously described dispersion and oil removal tests, the reaction jet baffle inlet was again proved superior to the simple overflow inlet weir. However, because of the brief duration of the testing program, it would be desirable to obtain more comparative oil removal data from the two separators. Actual separator behaviour was demonstrated to be far short of ideal behaviour and increasing flow rates caused an even greater discrepancy. An increase of the overflow rate from 500 to 4000 gal/ft/day decreased the efficiency of the reaction jet baffle from .81 to .59, and that of a simple inlet weir from .675 to .235. (Lowry-Texas)

AN INVESTIGATION OF THE EFFECTS OF RESIDENCE TIME ON ANAEROBIC BACTERIAL DENITRIFICATION,
California Univ., Davis.
Stephen F. Moore, and Edward W. Schroeder.
Water Research, Journal of the International Association on Water Pollution Research, Vol 4, No 10, p 685-694, October 1970. 8 fig, 2 tab, 19 ref.

Descriptors: *Denitrification, *Anaerobic conditions, Nitrogen, Phosphorous, Microorganisms, Physiology (Animal), Cost analysis, Hydrogen ion concentration, Waste water treatment, *Anaerobic bacteria.
Identifiers: *Residence time, Washout, Complete mixing, Methanol, Batch studies.

A bench scale laboratory apparatus was utilized in the study of the effect of residence time on cell yield and reaction rates in anaerobic bacterial denitrification. The contents of the reactor were assumed to be completely mixed, to be at or near steady state, and to follow first order kinetics with respect to cell growth. Analysis of the data obtained from the reactor revealed that (1) complete mixing is essential for optimal removal of nitrate in bacterial denitrification ponds, and (2) batch studies do not adequately model a continuous flow system. Also, bacterial denitrification was greatly influenced by the bacteriology, largely a function of the rate and composition of the feed. At optimum hydraulic and organic conditions, then, there existed also an optimum residence time which was determined to be 6 days for the waste and the conditions in this particular study. Nitrate buildup, reported to be a problem in earlier work, was not observed to be a problem in a completely mixed, continuous flow reactor. (Lowry-Texas)

NEW APPROACH TO PHOSPHATE REMOVAL: FILTRATION THROUGH MAGNESIA,
Anne Arudel County, Dept. of Public Works, Glen Burnie, Md.
Guenter Spohr, and Andres Talts.
Public Works, Jan 1971, Vol 102, No 1, p 58-60. 3 fig, 3 tab, 5 ref.

Descriptors: *Phosphates, *Filtration, Magnesium compounds, Pilot plants, Absorption, Hydrogen ion concentration, Alkalinity, Turbidity, *Waste water treatment.
Identifiers: *Magnesium oxide, Laboratory scale, Breakthrough, Regeneration, Suspended solids.

Both laboratory and pilot scale columns were utilized to determine the efficiency of removal of phosphate when it was passed through packed columns of magnesium oxide. Two commercially available magnesium oxides were analyzed, having bulk densities varying between 55 and 125 lb per cu. ft. The magnesium oxide was placed in glass columns 2.1 cm in diameter and of varying lengths. The phosphate solution was passed through the column of 1 gpm/ft sq. Four regeneration techniques were also evaluated with respect to how well they restored original performance of new media. Removal efficiencies in excess of 90% were recorded in this experiment, in agreement with work done earlier. Further study is needed to determine the actual mechanism of removal of the phosphate from the solution. More work remains to be done concerning regeneration of magnesium oxide also. Distilled water wash plus burning restored the magnesium oxide to removal levels comparable to new media, but the process is rather costly. No cost estimates are available at this time, but this and other papers suggest that filtration through magnesium oxide may be a workable means of phosphate removal in the future. (Lowry-Texas)

STAINLESS STEEL IN WATER AND WASTE WATER TREATMENT,
American Iron and Steel Inst., New York. Committee of Steel Plate Producers.
E. S. Kopecki.
Public Works, Jan 1971, Vol 102, No 1, p 81-83. 2 ref.

Descriptors: *Stainless steel, *Corrosion, Maintenance, Strength, Durability, Flexibility, Stability, Weirs, *Waste water treatment.
Identifiers: Microstrainer, Tanks, Aeration systems, Buckling.

Increasing corrosiveness of influent raw waters and waste waters to treatment plants has necessitated the changeover of many items in waste treatment plants from ordinary steel or iron to stainless steel. Stainless steel, while not able to compete economically if substituted in the same thickness as rolled iron or steel, is of such greater durability and strength that it may be possible to use a thinner gage of stainless steel to do the same job. The new light gage design concept is now incorporating the use of stainless steel into the original designs rather than merely replacing existing fixture with new ones of stainless steel. Many new plants, and new additions to existing plants are utilizing stainless steel almost exclusively in areas where corrosion is a problem. As more stainless steel is used the unit cost becomes smaller, and the overall plant maintenance is also greatly decreased. (Lowry-Texas)
W71-07381

LIGHT INTENSITY AND THE VERTICAL DISTRIBUTION OF ALGAE IN TERTIARY OXIDATION PONDS,
North Carolina Univ., Chapel Hill. Dept. of Environmental Sciences and Engineering.
William R. Hartley, and Charles M. Weiss.
Water Research, Vol 4, No 11, Nov 1970, p 751-763. 7 fig, 2 tab, 18 ref.

Descriptors: *Algae, *Oxidation lagoons, *Light intensity, Ponds, Rotifers, Protozoa, Photosynthesis, Chlorophyll, Temperature, Hydrogen ion concentration, Dissolved oxygen, Stratification, Sampling, Microorganisms, Sludge, Tertiary treatment, Biochemical oxygen demand, Waste water treatment, *North Carolina.
Identifiers: Durham (NC).

Five oxidation ponds at the Third Fork Treatment Plant in Durham, North Carolina, were investigated to determine the optimum lighting conditions, the types of organisms present in different situations, and their vertical distribution in the pond levels. Samples in the ponds were taken at 3,6,9,12,15,18,21,24 inches, and the sludge layer. These samples were taken every two hours over the 24 hour diurnal cycle. The samples were preserved in 3% formalin, and then taken to the laboratory for analysis. Light intensity, pH, dissolved oxygen, and temperature were also recorded at the time of sampling. The samples taken were counted for number of organisms present, and, also centrifuged for identification of species present in lesser numbers. The surface weirs installed in the ponds affect the chemical and physical parameters of pond performance with particular reference to the dissolved oxygen concentration, it being much lower in the pond which allowed the mat to form at the surface. Eugena Rostifera will change their vertical position in the pond to reach the point of submergence where the light intensity is 75 candles/ft2. Where they were not able to move to retreat from high light intensity cysts were formed. (Lowry-Texas)

THEORETICAL ANALYSIS OF ACTIVATED SLUDGE DYNAMICS,
Clarkson of Technology, Pottsdam, N.Y. Dept. of Civil Engineering.
Charles R. Ott, and Richard H. Bogan.
Journal of the Sanitary Engineering Division, American Society of Civil Engineers, Vol 97, No SA1, p 1-17. 8 fig, 5 tab, 16 ref. National Science Foundation Grant No GK-180.

Descriptors: *Mathematical models, *Computer models, *Simulation analysis, *Activated sludge, Kinetics, Organic loading, Effluents, *Biochemical oxygen demand, Model studies Sludge, Waste water treatment.
Identifiers: Step functions, Transients, Hydraulic loading, Influent, Suspended solids.

A computer simulation of the complete mixed activated sludge process was formulated to determine the response of the process to time variant BOD loading and amount of sludge recycle. Mass balance equations were derived for all processes concerned with the activated sludge mechanisms and these equations were then put into the computer. Perturbations to the system were provided either as step functions or time varying inputs. The effluent BOD was then monitored to determine the effect of the various inputs to the system. From the above simulation, it was determined that the effluent BOD concentration is two orders of magnitude more sensitive to variations in influent flow rate and BOD concentration than to variations in the sludge recycle rate. Also, the biological response rate was found to be very slow, and in the absence of adequate reserves of activated sludge, sludge recycle is relatively ineffective in controlling response of the process to rapid fluctuations in input conditions. Therefore control of input flow rate and input BOD appear to provide the most effective means of process control, and BOD mass escapement can be most readily accomplished by minimizing flow fluctuations. (Lowry-Texas)
W71-07383

STUDY OF AEROBIC THERMOPHILIC PROCESSES FOR WASTE TREATMENT,
Clemson Univ., S.C. Environmental Systems Engineering Program.
C. R. Nichols.
Environmental Systems Engineering Report 66-1, June 1966. 102 p, 19 fig, 8 tab, 62 ref, append.

Descriptors: *Aerobic conditions, *Aeration, Oxygen, Mathematical model, Temperature, *Waste water treatment, Metabolism.
Identifiers: *Thermophilic conditions, *Mesophilic conditions.

An investigation was conducted to determine the substrate utilization rate, organism growth rate and yield, organism decay rate, and kinetic constants for organisms grown in continuous flow, completely mixed reactors with turbine aerators. The constants were found for identical reactors under identical conditions except for the temperature in the mesophilic reactor being 26C and 54C in the thermophilic reactor. The reactors were closed systems with provisions for monitoring of influent and effluent gas and liquid streams. The substrate consisted of 1800 mg/l of glucose as the carbon and energy source and other elements necessary for growth. Evaluation of the data indicated that an oxygen limited situation existed at the lower residence times causing a change in the original proposed mathematical model which placed limitations on the data. The thermophilics were especially limited by this situation due to their high metabolic rate and low solubility of oxygen in water at the thermophilic temperatures. Little difference was found in the continuous flow 'constants' at the two temperatures. This was not expected and was probably due to oxygen limitations at the lower flow rates. (Ellis-Texas)

INDUSTRIAL WASTES FROM SCOURING RUG WOOLS AND THE REMOVAL OF DIELDRIN,
Wiedman and Singleton, Atlanta, Ga.
Robert D. Wilroy.
Proceedings Eighteenth Industrial Waste Conference, Apr 30, May 1-2, 1963, Purdue University, Lafayette, Ind, p 413-417, 1964.

Descriptors: *Anerobic digestion, *Dieldrin, Lagoons, Waste water treatment, Industrial wastes.
Identifiers: *Wool scouring, *Textile mill wastes.

Wool scouring waste can be effectively treated provided consideration is given to the requirements of the amount of treatment prior to discharge of waste. Dieldrin, a moth-proofing agent, can be treated and the agent can be removed down to a level of .25 mg/liter, but further dilution is necessary to reduce this level below the toxic limit. The treatment of wool scouring waste in a lagoon is of the anaerobic type and is effective both during summer and winter in the Southeastern United States. (Robinson-North Carolina State University)

COOLING TOWERS BOOST WATER REUSE.

Environmental Science and Technology, Vol 5, No 3, p 204-206, Mar, 1971. 4 fig.

Descriptors: *Cooling towers, *Water reuse, Marketing, *Thermal pollution, Cooling water, Water treatment, Operating costs.
Identifiers: *Cooling costs.

Cooling towers are now widely used in the petroleum and petrochemical industries, especially with the present drive for thermal pollution control. The largest market for cooling towers is electrical plants, as the electrical power use doubles every ten years. Brief description is given of various types of cooling systems, together with comparison of their economical and environmental features. Hyperbolic towers are being scrutinized from the viewpoint of their large initial costs and lack of functional efficiency in the United States. Cooling tower prices range from cheap models (plywood, galvanized steel hardware) whose cost is estimated at $5 per gallon, to the more expensive ones (silica bronze, stainless steel, etc.) which will cost $12 $13 per gallon of recycled water. Water treatment requirements are presented from the viewpoint of the four common operational problems: corrosion, scale, deposition fouling and microbiological attack. (Oleszkiewicz-Vanderbilt)

PARING MERCURY POLLUTION,
Mark D. Rosenzweig
Chemical Engineering, Vol 78, No 5, p 70-71, Feb 22, 1971. 2 fig.

Descriptors: *Heavy metals, *Industrial wastes, *Waste water treatment, Ion exchange, Filtration, Chemical precipitation.
Identifiers: *Mercury recover, *Chlor-alkali plant waste treatment, Osaka Soda process, Ventron Corporation process.

Two already commercialized flow-schemes for treatment of chlor-alkali plants' effluents are presented, both aiming at the upgrading of waste quality and mercury recovery. In the Osaka Soda process, successfully applied for 5 years, the waste water after sedimentation and filtration, followed by ion exchange, is passed to a tower containing Osaka Soda's 'MR' resin. Mercury is cut to an undetectable level with fresh resin, although it gradually builds up to 5 ppb and is typically 2 ppb. The operating costs are about $1/1000 gal of effluent. Just commercialized Ventron process utilizes sodium borohydride (NaBH4) to precipitate mercury-yielding elemental mercury and cleaning the wastes stream well below 10 ppb mercury. Taking into account the costs of recovered mercury, operating costs of this process are about $1 per lb of recovered mercury. The author indicates also that other processes are being developed by Environmental Engineering. Pilot-scale data have demonstrated the feasibility of reducing the concentration of mercury contaminants in minutes from 1000-2000 ppm to 50 ppb. (Oleszkiewicz-Vanderbilt)

E ORLY WATERWORKS OF THE CITY OF RIS.
gremont, Rueil (France).

ter and Water Engineering, Vol 74, No 890, p 5-146, Apr 1970. 6 fig, 1 tab.

scriptors: *Water purification, *Sludge treat- nt, Flocculation, Filtration, Chemical proper- s, Water works, Municipal water.
ntifiers: *Orly waterworks, *Alum recovery, chlorination, Dlarification, Aquazur V Filters, minum sulphate, Paris (France).

e treatment technology is utilized at a water pu- cation plant employing a coagulant recovery ocess is described. This highly automated treat- nt facility handles a normal flow capacity of 66 lion gallons per day of Seine River water. tails of the pretreatment, clarification, filtration, rilization reagent storage and feeding, pumping, m recovery, and monitoring, electrical, and con- l equipment facilities are provided. Filtration is omplished under a 3.9 foot head of water. This d is required to prevent the degassing of the ocess water in the filters during low and hot ather flows. The sludge from the clarification units is concentrated at 8g/l and then acidified with sulfuric acid to pH 3 to 3.2. The acidified sludge is fed to settling basins where the aluminum sulphate solution is recovered. The remaining sludge is neutralized with calcium carbonate in separate tanks. Physical and chemical characteristics of the water at different stages of the treatment process are presented. A flow diagram of the plant is also provided. (Nardozzi-AWWA)

RECALCINING LIME SLUDGE PRODUCES MULTIPLE BENEFITS,
Water Department, St. Paul, Minn.
Clifford W. Hamblin.
The American City, Vol 84, No 11, p 67-69, 115, Nov 1969. 2 fig, 2 tab.

Descriptors: *Carbon dioxide, *Water softening, Stabilization, Air pollution, Minnesota, Sludge treatment, Water works, Municipal water.
Identifiers: *Lime recalcining, *Washwater recovery, Quicklime, St Paul (Minn).

This study shows how lime recalcining and wash-water recovery at a municipal water utility can reclaim 9800 tons of 92% pure quicklime, 9950 tons of carbon dioxide and 170 million gallons of washwater annually. Extensive modifications to the existing facilities will permit handling of the 23,000 tons of dry solids produced annually while extending the life of sludge storage and reducing air pollution. Sedimentation of filter washwater is accomplished in separate settling basins. The carbon dioxide produced from the recalcining facility will be used to stabilize the softened water. It is expected excess quicklime can be recovered and sold to reduce plant operating costs. A flow diagram of the 60 ton per day raw sludge vertically constructed fluid bed type recalcining system is presented. Fuel requirements are 9 million Btu/ton of product output. Chemical characteristics of the lime sludge and the equipment required for construction are shown. (Nardozzi-AWWA)

NATURAL FREEZING FOR DEWATERING OF ALUMINUM HYDROXIDE SLUDGES,
Federal Water Quality Administration, Cincinnati, Ohio.
J. B. Farrell, J. E. Smith, Jr., R. B. Dean, E. Grossman, III, and O. L. Grant.
Journal American Water Works Association, Vol 62, No 12, p 787-791, Dec 1970. 5 fig, 2 tab, 9 ref.

Descriptors: *Snow cover, *Freeze-thaw test, *Lagoons, Dewatering, Phosphorus, Waste water treatment, *Freezing, Minnesota, Ohio, Sludge treatment.
Identifiers: *Filterability, *Solids contents, Aluminum sulfate, Aluminum hydroxide sludge, Ely (Minn), Cincinnati (Ohio).

Data presented provide a basis for the design of lagoons for the dewatering of aluminum hydroxide sludge by natural freezing. Temperature considerations and convective losses are considered in the freezing experiments. The freezing rate of aluminum hydroxide sludge parallels the freezing rate of water. Field testing at Ely, Minnesota showed that a snow cover could reduce the freezing efficiency of the sludge, but careful management could minimize this problem by freezing the sludge in thin layers and removing snow from frozen layers. With complete freezing, the dewaterability and solids content of the sludge can be significantly increased. Freezing in a mild climate as Cincinnati, Ohio would be successful in 1 inch layers. Layered freezing in partial freeze-thaw tests was not as a complete freezing. The ratio of phosphorus to aluminum in the sulfate form is shown to barely affect the filterability and solids content of aluminum hydroxide sludges. (Nardozzi-AWWA)

THE USE OF FILTER PRESSES FOR THE DEWATERING OF SLUDGES,
Johnson-Progress Ltd., Stoke-on-Trent (England).
C. M. Thomas.
Journal Water Pollution Control Federation, Vol 43, No 1, p 93-101, Jan 1971. 4 fig, 1 tab, 5 ref.

Descriptors: *Dewatering, Waste water treatment, Sludge disposal, Filtration.
Identifiers: *Filter presses, *Chemical conditioning, Water plant sludge.

The utility of a filter press to successfully dewater various waste water treatment sludges is presented. The advantages of a filter press operation are cited for a specific range of application over alternative methods as centrifugation, thickeners, vacuum filters, and pressure filters. The enumerated benefits include efficient filtration even with feed characteristic variations, minimized maintenance, improved filtrate quality, facility in cake handling, and competitive capital costs. Design consideration should be based on theory and pilot testing. Additional requirements for filter pressing may include sludge storage tanks and mixers, chemical conditioning plants, feed pumps, filter cloths, interconnecting pipework and pressure vessels, and filtrate collection trays. Conditioning, filtration cycle, feed and cake characterization, and cake thickness data are presented for water plant sludge. (Nardozzi-AWWA)

CHEMICAL COAGULATION OF KRAFT MILL WASTE WATER,
California Univ., Berkeley. Engineering Research Lab.; and Mississippi State Univ., State College; and International Paper Co. Mobile, Ala.
E. Joe Middlebrooks, W. E. Phillips, Jr., and Frank J. Coogan.
Water and Sewage Works, Vol 116, No 3, p IW7-IW9, Mar 1969. 4 fig, 1 tab, 4 ref.

Descriptors: *Coagulation, *Chemical oxygen demand, Biochemical oxygen demand, Color, Waste water treatment, Pulp wastes, Pulp and paper industry, Industrial wastes.
Identifiers: *Organic polymers, *Aluminum sulfate, *Kraft mill waste water, Colloidal suspensions, Suspended solids.

Colloidal suspensions which contain significant proportions of color, suspended solids, and chemical oxygen demand material in paper mill waste water can be removed by chemical coagulation with organic polymers. Analytical grade aluminum sulfate and 6 organic polyelectrolytes were tested on kraft mill waste water. Previous work with synthetic polymers and ferric sulfate is referenced. The coagulants were tested on grab samples and composite samples from the raw waste stream. The jar test procedure and parameter analysis techniques are explained. The organic polymers were equally effective in reducing chemical oxygen demand material, color and suspended solids. The aluminum sulfate was effective but tripled the sludge volume produced by the organic polymers. The coagulation efficiency changed with variations in the solution pH. None of the coagulants utilized could significantly reduce the biochemical oxygen demand of the waste. (Nardozzi-AWWA)

WATER TREATMENT PLANT WASTES DISPOSAL,
Orange County Sewer Districts, Orlando, Fla.
Robert McColgan.
Report to AWWA Research Foundation, Nov 11, 1970. 7 p, 2 ref.

Descriptors: *Injection wells, Sludge disposal, Sludge treatment, Lagoons, Neutralization, Dewatering, Filtration, *Water treatment, Wastes, Florida.
Identifiers: Alum coagulation, Aluminum hydroxide sludge, Activated carbon sludge, Pipeline disposal, Gamma ray sludge destruction, Nalco671,

Lake Washington, Florida Aquifer, Melbourne (Florida).

The project goal was to determine effective treatment or disposal of activated carbon and aluminum hydroxide sludges and the neutralization of the supernatant before discharge to a lake. Sludge disposal techniques included injection wells and pipeline disposal to roadbase pits. Sludge treatment methods included gamma ray sludge destruction, dewatering, and filtration. Sludge injection caused clogging of the aquifer and elimination of the groundwater as a potential supply. Pipeline disposal created a dewatering problem in the roadbase pits. A 0.1mg/l Nalco 671 polymer addition generated less sludge than radiation treatment and was as effective. Vacuum filtration, sand bed drying, centrifugation, and filter pressing concentrated sludge solids up to 20%. Basic research is recommended for sludge lagoons. Lagoon design considerations are a 2 1/2 foot maximum depth, a 10 foot clearance for dump trucks, and a buffer zone between lagoons and residential communities. (Nardozzi-AWWA)

RESEARCH ON WATER TREATMENT PLANT WASTE DISPOSAL,
American Water Works Association Research Foundation, New York.
Harry A. Faber.
Water and Sewage Works, Vol 117, No 11, p 379-383, Nov 1970. 4 ref.

Descriptors: *Freezing, *Dewatering, *Centrifugation, Phosphates, Lagoons, Water reuse, Water treatment, *Sludge disposal, Coagulation, Treatment facilities.
Identifiers: *Aluminum hydroxide sludge, *Lime recovery, *Ferric hydroxide sludge, Precoat vacuum filtration, Thickening, Sludge conditioning, Polyelectrolyte, Filter pressing, Primary coagulant.

A survey highlighting active research, demonstration, and in-plant studies of sludge and and filter washwater disposal. The problem of economical waste disposal techniques for purification and softening plant sludges is being investigated in various areas. The disposal of aluminum and ferric hydroxide sludges and the recalcination of lime sludge are enumerated for several dewatering processes. The survey cites references to freezing, centrifugation, precoat vacuum filtration, thickening, filter pressing, and lagooning procedures. Water reuse and phosphate removal systems are also listed. Projects examining sludge conditioning through chemical addition, and operations substituting polyelectrolytes as primary coagulants to treat filter washwater or raw water are discussed. A systematic program for the organization, coordination, and dissemination of research and demonstration projects is stressed. A central information resource program would promote pollution control technology beneficial to the water utility industry. (Nardozzi-AWWA)

DISPOSAL OF WASTE WATER FROM WATER FILTRATION PLANTS,
Metcalf and Eddy, New York.
G. P. Fulton.
Journal American Water Works Association, Vol 61, No 7, p 322-326, July 1969. 1 fig, 2 ref.

Descriptors: *Pollution abatement, Settling basins, Coagulation, Filtration, Sludge treatment, Sludge disposal, Waste water treatment, New York.
Identifiers: *Concentration, *Sludge freezing, *Alum recovery, Clarifier underflow, Filter backwash water, Monroe County Shoremont Plant (New York).

Processes for the successful treatment and disposal of potential pollutants from settling basin underflows and filter backwash water were examined to identify pollution abatement techniques. Limited physical and chemical characteristics of waste water were qualitatively and quantitatively reviewed to evaluate sludge freezing, alum recovery, vacuum filtration operations, and consideration was given to the disposal of water plant wastes to local sewage systems. Treatment goals of concentrating wastes and making these wastes suitable for disposal are discussed. Treatment cost is reportedly minimized by simplifying operations for personnel and limiting land area unit requirements. A settling rate of 250 gpd/ft sq was found acceptable for settling alum sludge, in its semifluid state, by using mechanical thickeners. The advantages and disadvantages of the treatment schemes are presented. Sludge freezing and alum recovery processes are referenced to plant scale operations. (Nardozzi-AWWA)

ALTERNATIVES FOR PHOSPHATE REMOVAL,
Neptune Microfloc, Inc., Corvallis, Oreg.
Stewart Davis.
Water and Sewage Works, Vol 117, No 10, p 336-338, Oct 1970. 2 fig, 1 tab, 2 ref.

Descriptors: *Water quality control, Tertiary treatment, Chemical precipitation, Lime, Flocculation, Phosphates, Waste water treatment.
Identifiers: *Tube settlers, *Mixed-media filter, Micro Floc, Shagawa Lake Project, Detention time, Alum.

Micro FLOC has developed a tertiary treatment process that can effectively remove orthophosphates and polyphosphates by chemical precipitation. Domestic waste water phosphous has been reduced to .5mg/l P using lime dosages of 200 to 500 mg/l CaO or alum dosages of 90 to 200 mg/l. The process combines flocculation, modular tube settlers, and mixed media filtration. Units range in size from 20 gpm to 200 gpm. Four 200 gpm units, requiring less detention time than conventional treatment systems, are being planned for Ocean Pines, Maryland. A Micro FLOC installation at Shagawa Lake has reduced effluent from 5.6 mg/l to 0.05 mg/l (PO_4 as P) using 145 mg/l alum. Similar advanced treatment processes as Battelle Northwest's 100,000 gpd trailer mounted system and a 280,000 gpd at Tualatin, Oregon are mentioned. A reference is also made to Lake Tahoe's lime coagulation system and recalcination operation. (Nardozzi-AWWA)
W71-07479

WASTE ALUM AND ACTIVATED CARBON SLUDGE SOLIDS REDUCTIONS METHODS,
Orange County Sewer Districts, Orlando, Fla.
Robert McColgan.
Report to AWWA Research Foundation, Nov 1970. 7 p, 6 fig, 2 ref.

Descriptors: *Waste storage, *Landfills, Sludge treatment, Sludge disposal, Florida, *Water treatment, Wastes, *Lagoons.
Identifiers: Alum sludge, Activated carbon sludge, Sludge transfer, Sludge thickening, Carryover, Melbourne (Florida).

A technique is described to limit alum and activated carbon sludge carryover from a waste storage lagoon of a water treatment plant. Initially, buckets were dragged through the settling lagoon to remove the sludge. This technique re-suspended settled material and produced a carryover in the effluent. A new lagoon of 2 1/2 to 3 feet deep with a 2 to 1 slope was constructed. Pumping enabled a sludge transfer from the original, primary lagoon to the new thickening lagooning. Sludge thickening was accomplished at the influent end of the lagoon, and the supernatant was recycled to the primary lagoon. The solids content of the thickened sludge was 6 to 10%. After additional drying, the sludge was used as a landfill. (Nardozzi-AWWA)
W71-07480

PLANNING OF MUNICIPAL WASTE WATER RENOVATION PROJECTS,
J. W. Porter.
J Am Water Works Assoc, Vol 62, No 9, p 543-548, Sep 1970. 3 fig, 2 tab, 6 ref.

Descriptors: *Water reuse, *Economics, *Cost comparisons, *Project planning, Water pollution control.

Increasing interest in water renovation and reuse rather than simply waste treatment and discharge is due to the severity of pollution control laws and localized shortages of water resources. Economic considerations concern cost comparisons between the water pollution control/water supply function of a water renovation facility, and the same functions in separate facilities. Technical considerations in planning a water renovation project are largely a function of the planned use of the product water. Several technical aspects are discussed including: process selection and water quality criteria, renovation system reliability, public health considerations, and pilot - demonstration work. The functions of water pollution control and water supply should be recognized institutionally, which involves cooperation between parties concerned. Five guidelines are included as suggestions in planning for public acceptance of water renovation.
W71-07515

TERTIARY TREATMENT OF SEWERAGE WATER,
Shozo Miyahara, and Tokiya Ando.
Sangyo Kogai, Vol 6, No 8, p 454-461, Aug 25, 1970. 46 ref.

Descriptors: *Tertiary treatment, *Water purification, *Water resources, *Feasibility.
Identifiers: *Sewerage water, *Japan.

Because of the increasing water need, the feasibility of sewerage water reuse is being investigated both technically and chemically. This new advanced method of utilization; tertiary treatment, is aimed at higher level purification of sewerage water beyond the secondary treatment stage. Due to projected water demand sewerage water has great potential as a new water resource if advanced technology is employed. Some problems involved in sewerage water reuse are associated with water quality including: generation of corrosion, slime, scale and ABC foaming, higher seasonal temperatures, and chloride ion concentration. Sewerage water reuse is presently limited in its application to cooling and washing uses. Discussed herein are several types of tertiary treatment for sewerage water primarily involving removal of suspended solids, nitric or phosphoric compounds, organic substances, and chlorine contained in sewerage water after secondary treatment.

INDUSTRIAL RE-USE OF COMBINED SEWAGE-TREATMENT PLANT EFFLUENT,
E. R. Hamilton, and C. F. Gurnham.
In: International Conference on Water for Peace, Vol 4, 1968. 12 p.

Descriptors: *Storm runoff, *Bypasses, *Water pollution sources, *Treatment facilities, Overflow, Sewage disposal, Water reuse, Illinois.
Identifiers: *Storm sewage, *Chicago (Ill), *Treatment method.

After reviewing the increasing water demands in the United States and the problems of future water shortage, the authors describe the steps taken in East Chicago, Illinois, to overcome problems of pollution and water shortage. Excess storm sewage which bypasses the sewage works enters Grand Calumet river and thence the southern part of Lake Michigan, causing serious restriction on the use of water for recreational purposes, particularly swimming. It is financially impossible to replace the combined sewerage system by a separate system

o, storm runoff is highly polluting. A scheme was erefore developed which will receive effluent m the existing sewage works and overflows of rm sewage from about one-third of the city, oviding treatment by equalization, sedimenta-n, oxidation, and biological processes. In dry ather there will be a detention period of at least days; and at peak storm periods there will be a nimal detention period of 24 hours. Discharge m the detention basins will be chlorinated and d in the overflow channel for the customary dis-ection period of 15 minutes before entering the and Calumet river. It is proposed that flows up to mgd will pass from the detention basin to a new tiary treatment plant, on which pilot-scale stu-s are being made. The quality of the effluent will only meet the anticipated standards for charge to the Grand Calumet river, but will ap-oach requirements for potable use and will be ac-otable for use as cooling water and often as in-strial process water. The plant will be flexible in eration, and water of almost any desired quality uld be tapped off at various points for sale to in-stry.

NE-MESH MECHANICAL SCREEN CONCEN-ATES PEAK WASTE LOADS.
ration Eng, Vol 1, No 10, p 8-10, Jun 1970. 2

Descriptors: *Waste water treatment, *Pollution abatement, *Overflow, *Sewers, Storm runoff, Equipment.
Identifiers: *Waste water concentrator.

A new product known as the waste water concentrator uses a mechanical screening principle to reduce pollution caused by the overflow from combined storm and sanitary sewage systems during periods of heavy rainfall. In storm overflow service, the concentrator can augment a treatment process via high-rate, fine mesh centrifugal screening which relieves the existing system of its hydraulic overload. It was demonstrated that the concentrator is capable of removing 99 percent of the floatable and settleable solids, 34 percent of the suspended solids, and 27 percent of the COD from sanitary waste. A description of the operation, apparatus, and maintenance involved in the concentrator's performance is given.
W71-07534

PRIMARY WATER TREATMENT AIDED BY COMPACT SEPARATOR.
Sweco, Inc., Los Angeles, Calif.

Chemical Engineering, Vol 77, No 15, p 48, 50, Jul 13, 1970. 1 fig.

Descriptors: *Sewage treatment, *Waste water treatment, *Sewage, *Storm runoff, Pollution abatement.
Identifiers: *Waste water concentrator.

A new kind of primary waste water treatment has been introduced to help pollution abatement specialists solve two of their most recurrent headaches: inadequate acreage for large enough settling basins, and excessive waste water loads resulting from heavy rainfalls. The waste water concentrator, as this unit is called, was designed primarily for municipal sewage treatment.

A GROWING MARKET FOR WATER AND WASTE WATER TREATMENT EQUIPMENT,
K. L. Kollar, and William G. Youngwirth.
Water Sewage Works, Vol 117, No 9, p 319-325, Sept 1970. 7 tab, 2 chart, 8 ref.

Descriptors: *Treatment facilities, Equipment, Evaluation, *Construction equipment, *Surveys, Waste water treatment, Costs.

This report summarizes and compares two studies (1965 and 1968) which are based on the response of manufacturers to a questionnaire on manufacturing plant production capacity and value of shipments of equipment used only in water and waste water treatment plants. Both surveys accounted for about 95% and 70% of equipment sales to municipal water and waste water treatment utilities and industrial water and waste water treatment respectively. In 1968, $248.4 million was spent for water and waste water treatment equipment by municipalities and industry with a 64..% increase in pollution control equipment. Tabled information includes: total expenditures, equipment shipments, structures, production capacities, and GNP comparisons. A list of equipment definitions is given.

THE MICROBIOLOGY OF BUILT UP POULTRY LITTER,
Edinburgh Univ. (Scotland). Dept. of Bacteriology.
Henrietta Schefferle.
Journal Applied Bacteriology, Vol 28, No 3, p 403-411, 1965. 5 tab, 7 ref.

Descriptors: *Microbiology, *Bacteria, Farm wastes, Poultry, Odor, Fungi, Aerobic conditions, Laboratory tests, Alkalinity, Enteric bacteria, Lactobacillus, Hydrogen ion concentration, Temperature, Moisture content.
Identifiers: Litter, Coryneform bacteria, Enterococci.

The numbers of viable bacteria in built up poultry litter were found to be 10 to the 10th power - 10 to the 11th power/g fresh weight and appeared to be little affected by factors such as age, temperature, moisture content and pH. Counts for unused litter and poultry droppings were lower. In built up litter of high alkalinity coryneform bacteria were predominant; micrococci occurred sporadically and small numbers of nocardias, streptomycetes, aerobic spore formers and streptococci were encountered. A variety of Gram negative bacteria also occurred, the numbers of which appeared to be controlled by alkalinity; they were less abundant in litters where the pH and buffering capacity were high. Strongly alkaline conditions also tended to lower the fungal counts but had no effect on the count of enterococci. (Christenbury-Iowa State)

INVESTIGATIONS ON FLY CONTROL BY COMPOSTING POULTRY MANURES,
Orange County Health Department, Santa Ana, Calif.
Roy E. Eastwood, Jimmy M. Kade, Robert B. Schoenburg, and Harold W. Brydon.
Journal of Economic Entomology, Vol 60, No 1, p 88-98, Feb 1967. 7 fig, 7 tab, 5 ref.

Descriptors: *Farm wastes, *Poultry, Aerobic conditions, Temperature, Degradation, Decomposing organic matter, Aeration, Mixing, Larvae, Bulk density, Volume, Moisture content, Nitrogen.
Identifiers: *Composting, Fly problems, Fly pupae, Windrows.

Windrow composting of poultry manure was investigated during several months of the year. Results obtained indicated that manure does not have to be ground prior to composting. Bulking and drying materials are not required in composting poultry manure. Fly larvae were reduced in numbers during the composting process so that they would not create a fly problem. Poultry manure once composted is not suitable as an oviposition site for adult flies and the subsequent development of larvae. A twice-weekly turning schedule with a manure spreader is desirable to help prevent fly larvae from pupating and emerging by bringing them into contact with the hot interior of the pile. (White-Iowa State)

DAIRY SET-UP FOR 200 COWS,
Guy Faulkner.
Power Farming, p 38-39, Jan 1970. 6 fig.

Descriptors: *Farm wastes, Lagoons, Slurries, Cattle, Hogs, Silage, Cereal crops, Costs, Waste water treatment, *Oxidation lagoons.
Identifiers: *Dairy cattle, *Evaporative lagoon, Free stall housing, Milking parlor, Farrowing houses, Collecting yard.

The article describes the layout and features of a newly developed dairy operation for 200 cows. Features include three 120 feet long steel framed loafing barns and a 100,000 cu. ft. capacity evaporative lagoon. The solidified contents of the lagoon will be dug out by a contractor in summer. A 200 sow pig unit has also been established on this 500 acre Sussex farm. (White-Iowa State)

FARM WASTE DISPOSAL SYSTEMS,
Purdue Univ., Lafayette, Ind. Dept. of Agricultural Engineering.
A. C. Dale.
Cooperative Extension Service, Purdue University, AE-80, Feb 1971. 10 p, 1 tab, 5 fig, 34 ref.

Descriptors: *Farm wastes, *Waste disposal, *Lagoons, *Oxidation lagoons, Aerobic conditions, Anaerobic conditions, Algae, Organic matter, Volume, Drying, Odor, Nitrogen, Aeration, Hogs, Cattle, Poultry, Research and development, Soil, Soil contamination.

Identifiers: *Disposal systems, *Land disposal, Oxidation ditches, Aerated lagoons, Composting, Refeeding, Anhydrous ammonia, Waste characterization.

In this publication the present available alternatives for animal waste disposal and criteria for selection of these methods are presented. A brief literature review tells of research being done in all areas and aspects of animal waste disposal. Land disposal still remains the most suitable and most widely used disposal method. Research indicates that approximately 250 pounds of nitrogen can be added to each acre of soil without unduly polluting it. Other methods of disposal discussed are aerobic, anaerobic, and mechanically aerated lagoons, as well as oxidation ditches, composting, and drying. Recommendations are made for the chemical treatment of animal wastes to reduce odors while spreading. (White-Iowa State)

AGRICULTURAL WASTE IN AN URBAN ENVIRONMENT.
New Jersey Animal Waste Disposal Task Force.

Proceedings of the Conference, 'Agricultural Waste in an Urban Environment,' Atlantic City, New Jersey, Sept 14-17, 1970. New Jersey Animal Waste Disposal Task Force. 256 p.

Descriptors: *Farm wastes, *Water pollution control, *Environment, Waste disposal, Cities, Grants, Research and development, Legislation, Communication, Poultry, Cattle, Odor, Lagoons, Aeration, Nitrogen, Moisture content, Aeration, Costs, Sewage, Agriculture, *Waste water treatment, Waste treatment.
Identifiers: *Urban environment, Land-Grant Colleges, Funding, Public relations, Refeeding, Land disposal, Research needs, Biological systems, Waste handling, Research funds, Recycling.

The groundwork for the conference 'Agricultural Waste in an Urban Environment,' was laid several years ago when the New Jersey Animal Waste Disposal Task Force was formed. Since its formation the Task Force has moved in four directions in an effort to find a solution to the agricultural waste problem. These have consisted of studying current laws, making maximum use of available methods of disposal, utilization and odor control, encouraging research, and informing the public of the issues. The conference was based on these four approaches. Various resources available to deal with the problem were brought together and, consequently the attitude of people of all levels of the economy, both rural and urban, was determined; additional resources were discovered; new interests were created; better communications were established; the latest technology was reviewed; and a plan of action was developed. A resolution passed by the delegates calls for a national conference on this matter by appropriate Federal officials. The main purpose of the conference was to find a way for rural and urban communities to develop their economies and reach their full potentials without becoming a nuisance to each other. WASTE DISPOSAL AND POLLUTION, POULTRY PROCESSING,
Ralston Purina Co., St. Louis, Mo. Engineering Waste Disposal Plant.
Rowland Retrum.
Proceedings of the Conference, 'Agricultural Waste in an Urban Environment,' New Jersey Animal Waste Disposal Task Force, p 64-75, Sept 14-17, 1970. 13 tab, 5 fig.

Descriptors: *Farm waste, *Poultry, Water pollution, *Waste water disposal, Sewage, Odor, Biochemical oxygen demand, Organic matter, Annual costs, Aeration, Aerobic treatment, Anacrobic digestion, Lagoons, Dissolved oxygen, Condensers, Incineration, Drying.
Identifiers: *Poultry processing, Solids, Rendering plants, Odor control, Chemical scrubbing, By-products.

It is the author's intention to attempt to define the problem of waste disposal and pollution with respect to poultry processing, to describe efforts now being made toward solution, to review cost effects, and to indicate promixing directions for accelerated investigation. The problems considered as the major pollution problems are feather litter, water pollution, sewage treatment odors, and rendering odors. Costs and other data are computed for an 80,000 bird per day broiler processing plant with a small associated rendering plant. Suggestions are made for decreasing the total waste load while increasing income. Systems for reducing the odor from both sewage treatment and rendering plants are explained. The odor problem is complex and there are no pat solutions. Any solution will be expensive. (See also W71-07552) (White-Iowa State)

FUNDING FOR AGRICULTURAL WASTE RESEARCH,
Cornell Univ., Ithaca, N.Y.
N. C. Brady.
Proceedings of the Conference, 'Agricultural Waste in an Urban Environment,' New Jersey Animal Waste Disposal Task Force, p 89-98, Sept 14-17, 1970.

Descriptors: *Farm wastes, Research and development, Environment, Agriculture, Water pollution, Foods, Domestic wastes, Industrial wastes, Properties, Waste disposal, Grants, Population, Legislation, Education, *Costs.
Identifiers: *Research funds, Agricultural waste problem, Environmental quality, Intensive animal agriculture.

Three basic assumptions are made on which to establish a common ground. First the agricultural waste problem is serious. Secondly, agricultural waste problems are not extensions of those waste problems facing municipalities and industry. Thirdly, the solutions to the agricultural waste problem require knowledge that we do not now have. These assumptions lead to the fact that research and adequate funding are badly needed. The following are avenues that could be developed for solving agricultural waste problems in an urban environment: (1) Agriculture and its related industries must see environmental pollution as a major threat to themselves; (2) Agriculture should work closely with state and Federal legislators to obtain funding for direct application to State Experiment Stations and USDA research agencies; (3) Greater coordination between agencies is needed so that a larger proportion of the Federal Water Quality Administration's research funds can be used for animal waste studies; (4) We must not ignore the possibilities of reorienting research funds already available, and; (5) The training and education of professionals in agricultural waste management is needed. DISPOSAL OF SOLID AGRICULTURAL WASTES - CONCEPTS AND PRINCIPLES,
Cornell Univ., Ithaca, N.Y. Dept. of Civil and Agricultural Engineering.
Raymond C. Loehr.
Proceedings of the Conference, 'Agricultural Waste in an Urban Environment,' New Jersey Animal Waste Disposal Task Force, p 126-134, Sept 14-17, 1970. 12 ref.

Descriptors: *Farm wastes, *Research and development, Waste disposal, Drying, Dehydration, Incineration, Beneficial use, Environment, Water pollution, Temperature, Moisture content, Odor, Feeds.
Identifiers: *Research needs, *Land disposal, Composting, Refeeding, Pyrolysis, Utilization, Waste management.

The state of development regarding suitable disposal methods for agricultural solid wastes is in an embryonic stage. A variety of techniques are possible but little information exists on the broad applicability of the techniques or on the detailed design and use parameter for the techniques with these wastes. Because of technical or economic difficulties, composting, drying and dehydration, incineration, and pyrolysis have not found wide application for animal solid wastes. Refeeding and land disposal offer the greatest opportunities for satisfactory disposal of animal wastes in the near future. The important research needs in the area of animal waste disposal include: (1) more thorough investigation of promising techniques, (2) utilization of non-traditional concepts, (3) evaluation of feasible disposal methods as part of animal production operations, (4) more and detailed cost information, and (5) broad interdisciplinary approaches and studies. RECYCLING AND UTILIZATION OF BIODEGRADABLE WASTES IN THE SOIL,
Rutgers-The State Univ., New Brunswick, N.J. Dept. of Agricultural Engineering.
Charles H. Reed.
Proceedings of the Conference, 'Agricultural Waste in an Urban Environment,' New Jersey Animal Waste Disposal Task Force, p 135-139, Sept 14-17, 1970. 2 fig.

Descriptors: *Farm wastes, *Biodegradation, Waste disposal, Water pollution, Nitrogen, Nitrogen compounds, Nitrogen cycle, Research and development, Conservation, Soil, Environment, Agriculture.
Identifiers: *Recycling, Utilization, Biological systems, Materials balance.

The survival of man depends upon the intelligent use of agriculture with its inumerable physical, chemical and biological systems and cycles. The author emphasizes that all biodegradable organic wastes could and should be recycled and utilized by natural biological systems on specialized sites on farms. The ability of soils to filter and degrade organic wastes and immobilize potential pollutants is widely recognized. Plants are among the best known converters of nitrogenous compounds to non-pollutional materials. A figure depicts the nitrogen cycle and how organic wastes are recycled by the soil. A chart is presented showing a program for recycling biodegradable wastes. To achieve this objective an interdisciplinary approach must be taken, which will necessitate much research requiring many tax dollars. (See also W71-07552) (White-Iowa State)

AGRICULTURAL WASTE RESEARCH NEEDS,
Rutgers-The State Univ., New Brunswick, N.J. Dept. of Agricultural Economics.
George W. Luke.
Proceedings of the Conference, 'Agricultural Waste in an Urban Environment,' New Jersey Animal Waste Disposal Task Force, p 140-141, Sept 14-17, 1970.

Descriptors: *Farm wastes, *Environment, Water pollution, Grants, Population, Surveys, Waste disposal, Volume, Odor, Livestock, New Jersey.
Identifiers: *Waste handling, Masking agents, Environmental quality, Residential areas.

Aided by a grant from the State Department of Health, the Department of Agricultural Economics conducted a survey of livestock enterprises in four agricultural counties in New Jersey to determine the volume of waste, the methods of handling waste, the cost of waste disposal, the attitude of farmers toward the problem of animal waste, and the location of farms relative to residential areas. The results of this survey are given and evaluated. Between 600,000 and 1 million tons of waste are produced and disposed of in the four counties an

ally. The typical method of disposal is on the d. Because the farms are small and confine only all numbers of animals, the threat to environntal quality is minimal. The closer to residential as the more meticulous the farmers are in hanng waste. Public agencies seeking to maintain vironmental quality should consider educational grams emphasizing the most acceptable pracs for the average size livestock farm. 5E. Ultimate Disposal of Wastes

GROUNDWATER POLLUTION FROM SANITARY LANDFILLS AND REFUSE DUMP GROUNDS, A CRITICAL REVIEW,
Marquette Univ., Milwaukee, Wis. Dept. of Civil Engineering.
A. E. Zanoni.
Wisconsin Department of Natural Resources, Research Report 69, 1971. 43 p, 8 tab, 62 ref.

Descriptors: *Landfills, *Water pollution, *Waste dumps, *Solid wastes, *Leaching, *Groundwater, Hydrogeology, Water pollution sources, Groundwater movement, Percolation, Water management, Impaired water quality, Waste disposal, Garbage dumps.
Identifiers: *Groundwater pollution, Landfill pollution effects.

A critical review is presented of the important literature covering the area of the groundwater pollution potential from sanitary landfills and dump grounds. This is followed by a review of the practices in twenty-one states in the U.S. related to this same topic. Based on the information derived from these two sources, a series of recommendations are suggested to regulatory agencies concerned with the task of approving and licensing solid waste disposal sites. It is emphasized that a regulatory agency should have available a geologist, ideally one trained in hydrogeology, to assist in sanitary landfill site selection processes. He should accumulate geological data and broadly outline areas considered as either good or poor potential landfill sites. Extreme caution should be exercised before approving ground disposal of industrial wastes. Monitoring wells should be used in cases where doubt exists as to the future effects of a particular landfill on groundwater supplies. The regulatory agency should follow a policy of slowing down the refuse degradation process by minimizing water percolation through refuse masses to provide for leachate attenuation. The regulatory agency should encourage regional or district approaches to solid wastes collection and disposal. As a rule, it should prohibit the use of abandoned rock, gravel or sand quarries as sites for refuse disposal. Regulatory agencies should support research in the area of ground water pollution. DISPOSAL WELL PROBLEMS IN CHICAGO AND BAKERSFIELD AREAS,
Consoer, Townsend and Associates, Chicago, Ill.
Ralph G. Berk.
ASCE National Water Resources Engineering Meeting, Phoenix, Arizona, Jan 11-15, 1971. Meeting Preprint 1302. American Society of Civil Engineers, Jan 1971. 28 p, 3 fig, 5 ref. Price $0.50.

Descriptors: *Industrial wastes, *Water pollution control, *Waste disposal, *Injection wells, *Wells, *Liquid wastes, *Hydrogeology, Chemical wastes, Well casings, Drilling, Drilling equipment, Phenols, Brine disposal, Geological engineering, Geologic control, Geologic investigations, Groundwater, Aquifers.
Identifiers: *Waste disposal wells, Well drilling problems.

Methods used and problems encountered are described in drilling two deep injection wells intended for the disposal of industrial liquid wastes. One well was drilled to a depth of 2,629 feet in the Chicago, Illinois area for disposal of 1,200 barrels per day of highly alkaline brines and phenols having a specific gravity of 1.15. The other well was drilled in the vicinity of Bakersfield, California for the disposal of cannery waste liquid from the San Joaquin Valley canneries. This well was to be capable of accepting 18,000 barrels per day of caustics, chlorides, and relatively small amounts of hydrochloric acid and vegetable oils--along with 100 ppm of suspended solids, 4,000 to 10,000 ppm total dissolved solids, 300 to 13,000 ppm BOD and 100 to 48,000 ppm COD, with a pH of 10.0 plus. Use of a combination well casing and injection tubing in the form of Saran-lined steel pipe, although of greater initial cost than the standard design of steel oil-well casing and plastic injection tube, has off-setting physical and economic advantages. With the vugate fractured Devonian disposal zones in the Chicago disposal well, the vacuum produced in injecting the liquid waste would have collapsed the smaller diameter injection tube. (Poertner)

NEW SEWAGE DISPOSAL SYSTEM AT TAHOE CITY.

Water and Sewage Works, Vol 118, No 1, p 6-8, Jan 1971.

Descriptors: *Sewage disposal, *Pumping plant, Water pollution, *Sewage effluent, Septic tanks, Pipelines, Sewage treatment, Springs, Percolation, California, Waste water treatment.
Identifiers: Tahoe City (Calif).

The 1968 California's law requiring the exportation of all sewage from the Lake Tahoe basin by January 1, 1972 inspired Tahoe City to come up with this imaginative disposal system. It utilizes three high speed pumps to lift the effluent 1400 ft. to the 'Cinder Cone' disposal area. This effluent is the outcome of a primary treatment plant which chlorinates and clarifies the sewage. The sludge cake is trucked 20 miles away and buried. The effluent flows to well compacted holding ponds and is then lifted to the 'sponge like', trench laced disposal area. Various studies were carried out and are still being conducted on the area and the draining springs. So far an increase of volume was detected with no adverse effects. (Rayyan-Texas)

HOW WE SOLVED OUR LIME SLUDGE DISPOSAL PROBLEM,
Water Department, Sioux Fall, S.D.
Paul V. Sanders.
Public Works, Vol 100, No 2, p 88-89, Feb 1969. 3 fig.

Descriptors: *Softening plant, Calcium carbonate, Lagoons, Sludge disposal, South Dakota, Water softening, Water treatment, Sludge treatment, Water works.
Identifiers: *Solids disposal method, Sioux Falls Water Department (SD).

The City of Sioux Falls required additional sludge drying bed capacity to handle 29 tons (dry weight) per day of calcium carbonate sludge. Since the expansion of existing facilities near to the softening plant was impossible, plans were made to pump the sludge 4550 ft to an elevation of 50 ft and provide gravity flow 1900 ft at a 5% grade. The waste generated during the construction of the lagoons that will provide 20 year storage is being disposed of in a nearby drainage ditch. Farmers and fertilizer companies are removing this material as needed. The sludge is pumped by a 4-inch Model D L Wemco pump in a 6-inch pressure line to low elevation areas at present. The line to the new facilities will be kept free by periodic flushing with a clean water service. The Water Department is working on new disposal applications for the sludge including uses as soil stabilizers, crop and pasture fertilizers, and soil sweeteners. (Nardozzi-AWWA)

ANN ARBOR'S RECALCINING PROCESS AND PROBLEMS,
Ann Arbor Utilities Department, Mich.
James C. Scott.
Journal American Water Works Association, Vol 61, No 6, p 285-288, June 1969. 3 fig.

Descriptors: Construction costs, Maintenance costs, Operating costs, *Sludge disposal, *Water treatment, *Wastes, Michigan, Water works, Water softening.
Identifiers: *Lime recalcining facility, Lime sludge, Ann Arbor (Mich).

Although a comprehensive report on Ann Arbor's water needs showed that the lagooning of lime sludge is an adequate disposal technique, the development of a lime recalcining facility was undertaken. The cost of the 24 ton per day lime reclamation facility is estimated at $1,200,000.00 including handling and treatment of the sludge from the clarifier to the finished lime storage tanks. The basic format is outlined of the process methodology from the lime sludge withdrawal to a lime product. The problems associated with this installation are those arising from personnel requirements, type of operation characteristics of sludge collected, winter equipment maintenance, and other equipment needs. The cost estimate is shown to be highly variable and a study of the proposed site and surroundings among other factors must be carefully evaluated. The problems are related to construction, maintenance, and operating costs. (Nardozzi-AWWA)

LAGOONING AND FREEZING FOR DISPOSAL OF WATER PLANT SLUDGE,
Metcalf and Eddy, Inc., Boston, Mass.
Stephen L. Bishop, and George P. Fulton.
Public Works, Vol 99, No 6, p 94-96, June 1968. 2 fig.

Descriptors: *Lagoons, *Freezing, Coagulation, *Water treatment, *Water works, Municipal water, New York, Sludge disposal, Sludge treatment, Wastes.
Identifiers: *Waste sludge storage, Gelatinous hydroxide sludge, Filter washwater, Shoremont Water Treatment Plant (NY).

The treatment of gelatinous hydroxide sludge and filter washwater from water filtration plants is a recognizable problem in pollution abatement. Alum recovery, vacuum filtration, and discharge of these wastes to sewerage systems are among some available treatment schemes. The advantages and disadvantages of these processes are discussed. Lagoons are shown to effectively settle and thicken sludges from the coagulation phase of the clarification process. Design parameters and sludge characteristics are given for the Shoremont Water Treatment Plant. In addition to providing waste sludge storage, the utility of lagoons for freezing the sludge as a treatment is discussed. The freezing process releases the water of hydration from hydroxide sludges and concentrates the sludge significantly upon thawing. This process is economical in climates where natural freezing could be used. At the Shoremont plant, the sludge concentration increased from 3.5 to 17.5% and the volume decreased considerably after freezing. Design considerations and operating procedures for lagoon-freezing operations are presented. (Nardozzi-AWWA)
W71-07461

ALUM RECOVERY FOR FILTRATION PLANT WASTE TREATMENT,
Metcalf and Eddy, New York.
George P. Fulton.
Water and Wastes Engineering, Vol 7, No 6, p 78-81, June 1970. 2 fig, 3 ref.

Descriptors: *Hydrogen ion concentration, *Filtration, Coagulation, Settling basins, *Water treatment, Water works, Wastes, Sludge treatment.
Identifiers: *Alum recovery, *Aluminum hydroxide sludge, *Acidulation, Thickener, Suspended solids.

Process considerations to be evaluated for alum recovery from an aluminum hydroxide sludge are described. The suspended solids content and other impurities contributing to the nature of the waste are examined with reference made to specific operating conditions and raw water quality. The advantages of a preliminary thickener before the acidulation step are explained. A settling basin overflow rate of 250 gpd/ft sq and a pH of 2.0 is considered to enhance sludge settling in final solid separation. A 10-minute minimum detention time is suggested for the acidulation step. An alum solution between 1 and 2 % should be obtained for an efficient operation. Filtration plants in the 200 to 500 mgd range with raw water suspended solids at 20 mg/l indicate recovery costs to be $3 to $5 per million gallons water produced. The utility of alum recovery is cited. (Nardozzi-AWWA)

POLYELECTROLYTE CONDITIONING OF ALUM SLUDGES,
Quible and Associates, Chase City, Va.; and Virginia Polytechnic Inst., Blacksburg, Va.
Henry M. Bugg, Paul H. King, and Clifford W. Randall.
Journal American Water Works Association, Vol 62, No 12, p 792-795, Dec 1970. 6 fig, 1 tab, 6 ref.
OWRR Project A-030-VA (1).

Descriptors: *Zeta potential, Dewatering, Water treatment, Wastes, Sludge treatment, Filtration, Metals.
Identifiers: *Polymer conditioning, *Specific resistance, Biological activity, Alum sludge, Jar test, Nalco, Polyelectrolytes.

Data show that alum sludge is more amenable to dewatering by gravity drainage or vacuum filtration with polymer conditioning. Water plant wastes are potential pollutants containing metallic ions and organic material that deplete the oxygen resources of a watercourse while inhibiting natural biologic activity. The polymers investigated were 2 cationic, 2 nonionic, and 3 anionic polyelectrolytes manufactured by Nalco. Jar tests showed that sludge-polmer mixing beyond 2 minutes caused a break up in the agglomerated floc. The cationic polymers were effective over a low pH band and the other polyelectrolytes were efficient in the pH 6.0 to 10 range. Anionic polymers performed best at the 2% sludge concentration and unadjusted pH of 6. Data are presented for the parameters of specific resistance and zeta potential for conditioned and unconditioned sludge. Bench-scale sand-bed drainage studies on a 4.2% alum sludge showed that conditioned material with 100mg/l of anionic polymer dewatered in one-fifth the time of unconditioned material. (Nardozzi-AWWA)

REVIEW OF SLUDGE DISPOSAL PRACTICES
Corps of Engineers, Washington, D.C., Washington Aqueduct Div.
John W. Krasauskas.
Journal American Water Works Association, Vol 61, No 5, p 225-230, May 1969. 1 tab, 15 ref.

Descriptors: *Sludge disposal, Settling basin, Lagoons, Centrifugation, Sludge treatment, *Water treatment, Wastes, District of Columbia, Filtration, Water quality act, Legislation, Water works, Municipal water.
Identifiers: *Filter washwater, *Basin sludge, Sludge freezing, Filter press, Barging.

This review indicates that additional legislation will implement the Water Quality Act of 1965 and control the discharge of water treatment plant wastes to natural watercourses. The Washington Aqueduct Division conducted a survey of United States water treatment plants that showed that filter washwater and basin sludge were discharg

urface waters in the majority of plants. A list of earch centers and treatment facilities studying tment processes is provided. The study shows the sludge composition of water plant wastes highly dependent upon the source water and chemicals utilized for treatment. Reference is le to several sludge disposal methods. These hods include discharge to streams, storm ers and sanitary sewers, settling in lagoons, ge freezing, centrifugation, vacuum filtration, r pressing, wedge wire filtration, sand drying s, and barging. Some design parameters, equip- t operating characteristics and cost data are n for actual installations. (Nardozzi-AWWA)

Water and Sewage Works, Vol 117, No 6, p 189-190, June 1970.

Descriptors: *Settling basins, *Lagoons, Pollution abatement, Sludge, Filtration, *Water treatment, Separation techniques.
Identifiers: *Washwater recovery, *Polyelectrolyte, Backwash cycle, Zeta Floc WA, Floc, Recovery basin.

In addition to the disposal of sludge from settling basins, the disposal of filter washwater is an important problem in water treatment plant pollution abatement. A polyelectrolyte, Zeta Floc WA, is stated to produce a dense floc when added to filter washwater during the backwash cycle. The coagulating chemical is fed dry to the waste water stream and is capable of producing an 80 to 85% washwater recovery when the waste is settled in lagoons or a recovery basin. Data for a typical backwash of 6 to 8 minutes with 60,000 gallons of water showed that 8 to 10 pounds of polyelectrolyte were required at a cost of $0.11 per pound. The sludge produced can be dewatered, recycled to the primary settling tanks, or utilized as a sewage sludge condition. (Nardozzi-AWWA)

THE NEW LANGFORD TREATMENT WORKS OF THE SOUTHEND WATERWORKS COMPANY.
Southend Waterworks Co.

Water and Water Engineering, Vol 74, No 894, p 319-327, Aug 1970. 12 fig, 1 tab.

Descriptors: *Construction, *Hydraulic design, Contracts, Chlorination, Hydrogen ion concentration, Filtration, *Water softening, Water works, Municipal water.
Identifiers: *Lime-soda softening, *Recycling, Prechlorination, Dechlorination.

The site, layout, foundation, administration, and plant specifications are described for a 12 million gallon per day lime/soda softening facility. In addition to the softening process, construction and hydraulic design considerations are outlined for the prechlorination, hydrogen ion concentration adjustment, gravity filtration, chlorination, and dechlorination processes. The lime/soda sludge is concentrated to 7000 gal/h and pumped at a rate of 3 1/2 feet per second through 4 inch PVC piping to a gravel pit. The sludge settles and the supernatant effluent from the pit is recycled to the plant intake line. Details are provided on the treated water pumping station and the architectural features of the utility. A history of the operating record of the Southend Waterworks Company is presented. A diagram of the water treatment processes and the site layout is included. (Nardozzi-AWWA)

THE NATIONAL ESTUARINE POLLUTION STUDY.
Secretary of the Interior, Washington, D.C.

Report of the Secretary of the Interior, Congress, S Doc No 91-58, 91st Cong, 2d Sess (1970). 633 p, 66 fig, 8 photo, 102 tab, 54 ref, 3 append.

Descriptors: *Estuaries, *Water pollution, *Water resources development, *Estuarine development, Gulfs, Oceans, Coasts, Bays, Rivers, Saline water-fresh water interfaces, Environmental effects, Environment, Federal government, Governments, Legislation, Social aspects, Legal aspects, Pollution

abatement, Water quality, Water pollution sources, Water pollution effects, Administrative agencies, Long-term planning, Estuarine fisheries, Federal-state water rights conflicts.

Pursuant to the Clean Water Restoration Act of 1966, the Secretary of the Interior herein presents a technical analysis of the estuarine zone, identification of scientific knowledge gaps, and an inventory of the available knowledge, all of which form the basis for the recommended comprehensive management program for the nation's estuarine resources. Included in the report are: (1) summary and conclusions of information leading to the recommended national program; (2) recommendations for a comprehensive program of estuarine development and management, including new legislation and suggested roles for government; (3) discussions with respect to technical management problems of the interaction between the biophysical and socioeconomic environment of the estuarine zone; (4) an evaluation of the institutional environment as it presently exists and recommendations for changes; (5) the development of data on the estuarine zone to provide the basis for sound technical management through rational institutional management; and (6) a description in general terms of the mass of reference materials from which the information in this report was derived. The active implementation of these recommendations will permit maximum use of the entire estuarine zone while preserving it for the benefit of future generations. (Smiljanich-Florida)

SECOND SESSION OF THE CONFERENCE ON THE MATTER OF POLLUTION OF LAKE MICHIGAN AND ITS TRIBUTARY BASIN.
Federal Water Pollution Control Administration, Washington, D.C.

Proceedings of the Second session, Conference on Pollution of Lake Michigan and its tributary basin, Illinois, Indiana, Michigan, and Wisconsin, held Feb 25, 1969 at Chicago, Illinois. Vol 1: 364 p, 13 fig, 8 tab, 12 append; Vol 2: p 365-968, 1969. 20 fig, 14 tab.

Descriptors: *Conference, *Lake Michigan, *Water pollution sources, *Phosphorus, *Water pollution control, Tributaries, Municipal wastes, Industrial wastes, Waste treatment, Nuclear wastes, Thermal pollution, Ships, Chlorination, Dredging, Sediments, Soil erosion, Oil, Phenols, Electric powerplants, Insecticides, Agriculture, Flood plain zoning, Regulation, Monitoring, Harbors, Beaches, Watersheds (Basins), Pathogenic bacteria.
Identifiers: Watercraft wastes, Alewife, Oil spills.

The Second Session of the 1969 Conference on the Pollution of Lake Michigan heard representatives from the Corps of Engineers, Michigan, Indiana, Illinois, Wisconsin, Department of Agriculture, FWPCA, the 5th Army, and Navy on problems and solutions to water pollution, treatment, and elimination, including dredgings, disinfection, chlorine residues, municipal and industrial waste water treatment, soil erosion, flood plain control, economics, storm and waste water sewerage, diversion, interstate transportation of industrial wastes, federal-state concurrent jurisdiction, sampling, monitoring, watercraft and shipping wastes; pollution of marinas and beaches, law formulation and enforcement, shore disposal facilities, insecticides, interstate standards, programs for reducing sediment pollution and erosion damage. Also outlined were waste control and treatment in federal installations and shipboard disposal systems, uniform regulations on watercraft wastes, nuclear plant wastes, and thermal pollution standards, state water quality standards, utilization of thermal water, and alewife die-off. It was concluded that an average 80% reduction of phosphorus loadings into Lake Michigan can be achieved by 1972. (Auen-Wisconsin)

GENERAL MOTORS APPROACH TO WATER POLLUTION CONTROL,
General Motors Corp., Detroit, Mich.
G. N. Tiberio.
Proceedings, Industrial Waste Conference, 21st, Purdue University, Vol L, No 2, p 440-446, Mar 1966. 3 fig.

Descriptors: *Water pollution control, *Waste water treatment, *Cost analysis, *Industrial wastes, Oily wastes, Toxicity, Incineration, Vacuum drying, Dewatering, Coagulation, Flotation, Hydrogen ion concentration.
Identifiers: Management attitudes, Plating wastes, General Motors Corporation.

The full scope of water pollution control at the 15 General Motors facilities is discussed, with particular attention to the past history of pollution control practices in the GM administrations. At present, no plants are discharging any effluents which violate pollution control statutes. However, future plans have already been made for further developments. These include: (1) design, construction and maintenance of treatment facilities will be presented to plant managements as being of equal importance with manufacturing facilities; (2) pollution control should become an integral part of the total unit production cost; (3) water re-use and chemical recovery processes should be much more extensively explored to determine which process can be utilized; and (4) better methods for control and treatment of plating and oil waste sludges are imperative. At the present time, vacuum filtration, flotation, coagulation, and final clarification are used for oily wastes, while treatment of plating wastes involves many of the same processes in a different arrangement. (Lowry-Texas)

Available from Edison Electric Institute, 750 Third Avenue, New York, NY 10017 as EEI Pub No 70-902, Price $2.00. Cooling Water Studies for Edison Electric Institute, Research Project RP-49, Report No 6, Aug, 1970, Johns Hopkins University, Baltimore, Maryland.

Descriptors: *Thermal powerplants, Economics, Cooling water, Benefits, Costs, Area redevelopment, Input-output analysis, Project planning, Mathematical models, Temperature, Thermal pollution, *Optimization, Statistical models, Mathematical studies, *Optimum development plan, Sites, Temperature control, *Model studies.

Three models are presented for the optimal siting of thermal-electric generating stations. The models may be used as aids in making location decisions, particularly by showing the sensitivity of the models' optimal solution to changes in input parameters, and also by permitting the evaluation of costs associated with different siting policies and different temperature standards. The models presented are a zero-one integer programming model, a mixed integer programming model and a model with probabilistic temperature constraints. A working solution, type and format of input information, and a sample problem are presented. A general discussion of the economic aspects of an integrated power generating system and of questions relating to efficient utilization and growth of such a system is also presented. OLING TOWER FOG: CONTROL AND ATEMENT,
ernational Nickel Co. of Canada Ltd., Sudbury ntario).
nnie Veldhuizen, and Joe Ledbetter.
rnal of the Air Pollution Control Association, 21, No 1, p 21-24, Jan 1971. 1 fig, 2 tab, 21 ref.

scriptors: *Cooling towers, *Fog, Costs, Hu-lity, Water pollution control, *Pollution abate-nt, *Thermal pollution, Texas.
ntifiers: Control methods, Superheating, mes, Air cleaning, Houston (Tex).

gs from cooling towers are causing an increasing nber of visibility problems in addition to icing of ds, sidewalks, powerlines, etc. during freezing ather. This paper summarizes a study made to ertain the best method of fog control or abate-nt at a refinery in Houston, Texas. The induced ft, counterflow cooling towers of concern have ign capacities of 750 million and 225 million /hr under local climatic conditions. Wherever sible, preliminary capital, installation, and rating costs for all the alternatives were ob-ed and summarized in a table. The most nomical solution for this particular problem is nload the cooling tower for the estimated 150 rs a year either by disposing of or storing the water. Complete control by altering the heat hange mechanism is possible but the costs are rbitant. Dry towers which are being considered prevent fogging, are very expensive. For new ling towers, its location is recommended as a important factor. (Upadhyaya-Vanderbilt)

scriptors: *Nuclear powerplants, *Thermal pol-on, Cooling water, Cooling towers, Environ-ntal effects, Water pollution control.
ntifiers: Heat dissipation, Heat utilization.

ummary is presented of the operational parame-of some 34 nuclear power plants in the United es and some 16 nuclear power plants overseas. oling parameters are determined with indication the thermal effects study will be undertaken in out of 34 cases in the United States. To limit the sibility of adverse effect on the environment, eral utilities will have cooling towers or ponds; ers will employ a variety of techniques for dly dispersing the heated effluent in the water-rse. Two ways to achieve good mixing are used: erforated condenser discharge pipe extending into a watercourse-like that at TVA's Brown ry-and a system of weirs to rapidly dilute warm uent. While utilities find ways to dissipate heat, ctor vendors are looking into methods for using eneficially to: (1) provide hot water for urban ting and absorption air conditioning systems (2) to increase rate and effectiveness of sewage tment processes. PROTECTING OUR ENVIRONMENT AND NATURAL RESOURCES IN THE 1970's,
Allen V. Kneese.
Resources for the Future, Inc, Washington, DC, Reprint No 88, August 1970. 8 p, 1 ref.

Descriptors: *Water pollution control, *Environmental sanitation, *Economic efficiency, *Federal project policy, Federal government, Effluents, Economic feasibility, Economic justification, Economics, Natural resources, Environmental engineering, Grants, Taxes, Water quality control, Water pollution treatment, Administration, Regional analysis, Legal aspects, Cost allocation, Coordination, Political constraints, Legislation, Interstate commissions, Interstate compacts, Non-structural alternatives.
Identifiers: *Effluent charges, Federal Water Pollution Control Act.

This reprint of a statement before the House Subcommittee of the Committee on Government Operations examines environmental pollution problems from an economic perspective, and outlines a proposed water pollution control strategy. The inadequacy of governmental subsidies and technological fixes increases the importance of managing the environment in terms of 'common property resources'. The author rejects existing federal water pollution control strategy based on municipal waste treatment grants under the Water Pollution Control Act of 1956 and state water quality standards, imposed by the Water Pollution Control Act of 1965. The inadequacy of this strategy stems from: (1) lagging appropriations, (2) ineffective enforcement, and (3) poor coordination. Industrial tax incentives are also rejected as economically ineffective. An effluent charges system, coupled with regional management, is economically superior to other plans because: (1) effluent charges require payment for resource use, (2) subsidies provide no inherent incentives, (3) subsidies bias technique selection, and (4) effluent charges produce revenue. A national effluent charge would avoid local political pressures. Federal leadership establishing interstate management appears more practical than direct federal administration as a means of obtaining regional management efficiency. (Earl-Florida)

FINAL REPORT OF THE TECHNICAL COMMITTEE ON STORM OVERFLOWS AND THE DISPOSAL OF STORM SEWAGE,
J. T. Calvert.
Inst Civil Engrs (London), Vol 47, p 305-308, Oct 1970.

Descriptors: *Sewage disposal, Costs, Water pollution sources, Sewers.
Identifiers: *Storm overflows, Great Britain.

An informal discussion on the Committee's findings shows that: (1) the abolition of all storm overflows was not recommended because the enormous cost could not be justified and pollution from surface water sewers could still occur; and (2) a new formula, in which the amount of sewage to be contained in the system downstream of the overflow would vary only slightly with water consumption and the formula would broadly ensure the polluting matter from each person was diluted by a fixed amount of rainwater before spill commenced, were recommended.

COMBINED SEWER REGULATOR OVERFLOW FACILITIES.
American Public Works Association, Chicago, Ill.

FWQA Contract No 14-12-456, Program No 11022DMU, Jul 1970. 139 p, 38 tab, 4 append.

Descriptors: *Overflow, *Regulation, Design, Operations, Maintenance, Control systems.
Identifiers: *Combined sewers, Tide gates, Overflow quantity, Overflow quality.

Current design, operation, and maintenance practices used by local jurisdications in the United States and Canada were determined by personal interviews and compiled in this report. Particular attention was given to the performance of various types of regulators, the use of tide gates, new designs, European practices, and the systems concept of combined sewer regulation. Thirty-seven drawings and photographs of regulators are included. 17 recommendations are made, the adoption of which would upgrade regulator facilities and tend to reduce receiving water pollution from combined sewer overflows.
W71-07520

METROPOLITAN BOSTON'S WASTE WATER QUALITY CONTROL PROGRAM.

Water Sewage Works, Vol 117, No 9, p 300-304, Sep 1970.

Descriptors: *Water pollution sources, *Overflow, *Legislation, *Treatment facilities, Pollution abatement, Water quality control, Massachusetts.
Identifiers: *Storm overflows, *Boston (Mass).

This paper traces the historical factors contributing to the sewage problems in Boston, Massachusetts and accredits the general causes for the pollution conditions to: (1) the raw sewage discharge into Boston Harbor, and (2) mixed sewage and storm water overflow into tributary rivers, streams, and basins. Pertinent sections of legislation authorizing pollution control construction as well as associated legislative acts are mentioned. A description of existing sewage treatment plants and important features of the improvement programs is given. A new anti-pollution installation on the Charles River, expected to be undergoing acceptance and evaluation tests in late 1970, will accumulate, detain, and chlorinate overflow from combined sewage and surface drainage occurring during heavy storms.
W71-07521

THE CARDIFF EASTERN DISTRICT DRAINAGE SCHEME,
S. R. Salt.
Inst Munic Engrs, London, Vol 97, No 9, p 246-254, Sept 1970. 8 fig, 2 ref.

Descriptors: *Sewerage, *Sewers, *Planning, *Drainage systems, Treatment facilities.
Identifiers: *Great Britain.

The area around Cardiff, Wales is serviced by three sewerage systems which have continued in use from the latter half of the 19th century until recently, with only one major change, despite expansion of the city. It was clear that a major renewal was required if further development on the east side of the city was not curtailed. The new plans would: (1) eliminate three storm overflows, (2) ensure far off-shore discharge, (3) provide for the screening of the total flow, and (4) maintain existing sewers. Thus the scheme, which is detailed herein, would include two runs of duplication sewers, a new pumping station, and a new sea outfall.
W71-07526

EFFECT OF RAIN COLLECTING BASINS ON THE YEARLY INFLUX OF POLLUTANTS INTO A SEWER MAIN: FUNDAMENTALS OF DIMENSIONING COLLECTING BASINS,
Walter Munz.
Gas-Wasserfach, Vol 109, No 30, p 823-827, July 26, 1968. 4 fig, 1 tab, 8 ref.

Descriptors: *Sewers, *Infiltration, *Water pollution sources, Mathematical studies.
Identifiers: *Collecting basins.

The International Water Protection Commission for Lake Constance was faced with the question of the magnitude of the effect of an individual measure on the yearly influx of pollutants into the sewer main. To provide an answer, the author worked out a procedure for computations of material flows for different combinations of measures of differing effectiveness under given conditions. Such computations were carried out at the Zurich Technical University and the Baden-Wurttemberg Hydrological Administration. The results of the computations relating to the elimination of BOD by various combinations of pertinent measures are presented in graphs and briefly discussed. The author also presents a systematic classification of all possible kinds of rain collecting basins according to basin type and the relative altitude of the basin outlet with respect to its inlet.

STORM-WATER RETENTION CAN WORK...AND PREVENT THE HEAVILY POLLUTED 'FIRST FLUSH' FROM OVERFLOWING TO DAMAGE THE RECEIVING RIVER,
Gerald Remus.
Am City, Vol 85, No 10, p 68-69, Oct 1970. 2 fig.

Descriptors: *Storm runoff, *Sewers, *Monitoring, *Control systems, Sewerage, Data collections, Michigan, Waste water treatment, Water pollution control.
Identifiers: *Detroit (Mich), *Overflow abatement.

An intense thunderstorm over Detroit, Michigan dropped about one billion gallons of water with about 450 million gallons entering the sewer system that processed 365 million gallons in excess of average flow during the following 30 hours. The system retained so much storm water that the overflow outfalls, which normally discharge into the Detroit and Route Rivers, had very little to do. The sewer monitoring and remote control system, briefly discussed, efficiently compiled rainfall and sewer-level data every five minutes.

Identifiers: *Water supply systems, *Sewerage systems, *USSR.

The construction of sewers and water supply tunnels made of large dimensional and relatively thin-walled reinforced concrete components has been experimented with by the Soviets. The methods of construction of reinforced concrete waterproof wall panels for rectangular and round vessels are discussed.
W71-07537

PHOTOGRAPHY AND OTHER REMOTE SENSING OF WATER POLLUTION,
R. K. Lane.
Water Pollution Control, Vol 108, No 9, p 20-21, Sept 1970.

Descriptors: *Photography, *Data collections, *Remote sensing, Effluents, Pollutants.
Identifiers: Water pollution studies.

Photography has long been used as a remote sensing tool for environmental data collection from aircraft. In water pollution studies most interest is centered around the need for observing the behavior of effluents which introduce pollutants to rivers or lakes. Qualitative examinations of effluents through photography can be useful to locate effluents, to determine how their behavior is affected by local characteristics, ambient flow rates, and meteorological conditions, and to determine relative intensities of discharges. Techniques for quantitative assessments of polluted discharges are not yet operationally effective.

ANIMAL WASTE REUSE--NUTRITIVE VALUE AND POTENTIAL PROBLEMS FROM FEED ADDITIVES--A REVIEW.
Agricultural Research Service, Beltsville, Md. Animal Science Research.

ARS 44-244, Feb 1971. 56 p, 3 tab, 184 ref.

Descriptors: *Farm wastes, *Additives, *Feeds, Ruminants, Poultry, Cattle, Diets, Hazards, Hogs, Biodegradation, Pathogenic bacteria, Larvicides, Pest control, Organophosphorus, Nutrients.
Identifiers: *Literature review, *Residues, Swine, Hormones, Antibiotics, Disease control, Growth adjuvants, Excretion data, Registration, Non-nutritive.

This is a report of literature on the nutritional value of animal wastes and the potential problems that may occur when compounds other than nutrients are added to animal feed. The non-nutritive feed additives discussed are as follows: Pellet binders, flavoring agents, enzymes; Antibiotics, arsenicals, nitrofurans, (low level feeding); Antifungals, lar
cides; Broad-spectrum, absorbable antibiot
(high level therapeutic use); Chemicals used
potentiate curative properties of antibiotics; Co
cidiostats, worming drugs, antioxidants; Caro
noid sources, hormones; Reserpine, aspirin, a
tranquilizing drugs. (See also W71-07543 th

**RIVER BASIN AUTHORITIES: A NATIONAL
SOLUTION TO WATER POLLUTION,**
Harvard Univ., Cambridge, Mass.
Marc J. Roberts.
Harvard Law Review, Vol 83, p 1527-1556, May 1970.

Descriptors: *Water pollution control, River basin commission, Pollution abatement, Waste treatment facility, Economic efficiency, Resource allocation, Streamflow, Investment credit.
Identifiers: *Effluent charge, Subsidy, Equity, Social cost, Tax incentive.

Some reforms suggested for water pollution control are analyzed and a new approach to water pollution abatement is proposed. The most prevalent suggestion to stimulate private pollution control investment has been the use of tax incentives usually through accelerated depreciation or some form of investment credit. The author finds that proposed tax incentives are too small to generate much business response and moreover tend to shift funds away from least-social-cost approaches such as chemical treatment or land-intensive procedures. Finally, industrial incentives or subsidized municipal treatment of industrial wastes shifts the cost of pollution to the government with resulting economic misallocations. The author suggests the formation of strategically located federal river basin authorities to control and conduct all pollution abatement activity. With federal funding for treatment of domestic wastes and efficient service charges for treating industrial effluent, the basin authority is an equitable and efficient method of meeting water quality standards. WATER QUALITY CONTROL PRACTICES ON THE GREAT LAKES,
Ontario Water Resources Commission, Toronto.
J. R. Barr, and A. C. Priatz, Jr.
In: Great Lakes Water Resources Conference, Toronto, The Hydro-Electric Power Commission of Ontario, p 393-417, 1968.

Descriptors: *Great Lakes, *Water quality, *Pollution, *Water resource development, Waste treatment, Water management, River basins, Sewage, Watersheds, Lakes, Government, Capital costs, Financing, Planning, Sewers, Pesticides.
Identifiers: *Education, *Water Quality standards, Bond financing.

Water quality control practices on the Great Lakes are considered in two sections, namely the Canadian and United States practices. The Canadian section indicates that historical water quality control practices point to a need for new objectives to insure the long-term water quality of the Great Lakes. However, it is then indicated that such new actions, particularly pollution control, call for mass education of municipalities, industry and the public for financial program support of activities which do not yield an immediate self-benefit. The American section, on the other hand, indicates that water quality control practices are constantly undergoing improvement in response to concern on the part of the public in favor of a preventive approach to pollution. The author also cites improved co-ordination between responsible branches of government as another recent trend in water quality control, particularly as seen in the uniform laws of the Water Quality Standards Programme and State-wide treatment of waste and water management. Such current trends are presented as indications that water resources will be optimally preserved for future use. (See also W71-07565) (Murphy-Rutgers)

SOURCE CONTROL OF URBAN WATER POLLUTION,
Florida Univ., Gainesville. Dept of Engineering and American Public Works Association, Chicago, Ill. Technical Services.
James P. Heaney, and Richard H. Sullivan.
Journal Water Pollution Control Federation, Vol 43, No 4, p 571-579, Apr 1971. 9 p, 1 fig, 9 tab, 14 ref.

Descriptors: *Water pollution sources, *Cities, *Urbanization, *Storm runoff, *Water pollution control, Water pollution effects, Pollutant identification, Illinois, Runoff, Storm drains, Sewage, Sewers, Water quality, Water management (Applied).
Identifiers: *Urban runoff, *Urban hydrology.

An exploratory study was undertaken to obtain a 'solids budget' of urban runoff within a 10-acre area in Chicago, Ill. The sources investigated included air pollution, sanitary wastes, garbage, and miscellaneous solids. The source controls examined were catch basin cleaning, sewer cleaning, and street sweeping. Unit costs of street sweeping indicate that catch basins and their cleaning, along with subsequent sewer cleaning, make them undesirable. Garbage grinders are also a likely possibility for reduced use or outlawing. (Knapp-USGS)

POLLUTION CONTROL AT A MAJOR OIL SPILL,
Union Oil Co. of California, Los Angeles.
T. H. Gaines.
Journal Water Pollution Control Federation, Vol 43, No 4, p 651-667, Apr 1971. 17 p, 1 fig, 1 tab, 1 ref, 4 append.

Descriptors: *Water pollution control, *Oily water, *Oil fields, *California, *Water pollution treatment, Reviews, Water pollution effects, Cleaning.
Identifiers: *Oil spills, *Santa Barbara (Calif).

The paper is a comprehensive report on the efforts made to limit the pollution effects of the Santa Barbara oil spill of January 28, 1969. The use of polyelectrolytes and dispersants is reviewed. Application techniques and their effectiveness are discussed. The role of the Federal Water Quality Administration in the occurrence is included. Containment of the oil side with a boom was unsuccessful. An attempt was made to use booms to protect the shoreline, but heavy seas prevented their use. After the beaches were inundated with oil, cleanup efforts were started with a peak labor force of 1,000 men. Over 30,000 tons (27,000 metric tons) of storm debris were cleaned up. A system of containment for undersea seepage is described. A complete equipment list and progress report is included in the paper. (Knapp-USGS)

COOLING TOWERS,
Black and Veatch, Kansas City, Mo.
Riley D. Woodson.

Scientific American, Vol 224, No 5, p 70-78, May 1971. 9 p, 8 fig, 1 tab.

Descriptors: *Cooling towers, *Cooling water, *Industrial water, *Engineering structures, *Heated water, Thermal pollution, Structures, Structural design, Construction, Reviews, Cooling, Heat transfer, Recirculated water, Methodology.

Hot water carrying waste heat from a large industrial installation such as a powerplant is often best handled by a tower that breaks the water up, cools it in a cross draft of air and then recirculates it. Four types of towers are depicted schematically. 1. The atmospheric tower, which was one of the earliest types of cooling tower, relied on natural winds and the aspirating effect of the spray nozzles to provide cooling air. 2. The mechanical-draft crossflow tower, which is the kind in widest use at present, has a fan at the top to draw air in through the louvers, across the path of the falling water and out of the stack. 'Fill' is the material that breaks up water into fine droplets; the drift eliminators retard the movement of water out of the stack with the departing air. 3. The mechanical-draft counterflow tower is similar except that the air moves vertically upward through the falling water. 4. The hyperbolic natural-draft tower has no fan; the draft results both from the height of the structure and the difference in density between the warm, moist air inside the tower and the colder, denser air outside. Discharge is far above ground. (Woodard-USGS)

IMPROVED METHODS FOR PLANNING OF THERMAL DISCHARGES BEFORE SITE ACQUISITION,
Battelle Memorial Inst., Richland, Wash. Pacific Northwest Lab.
R. T. Jaske.
Atomic Energy Commission Research and Development Report, BNWL-SA-2737 17 p, Dec 1969. 6 fig, 9 ref.

Descriptors: *Thermal pollution, *Water temperature, *Powerplants, Model studies, Water quality, Standards, Optimization, *Sites, Water pollution control.
Identifiers: *COLHEAT simulation model, Thermal discharge.

The most significant factors for site selection of a powerplant are thermal effluent considerations, existing transmission system, plant size, environmental impact, and consumer requirements. To relate steam temperature modification with optimum public utilization Battelle Northwest developed COLHEAT, a deterministic one-dimensional temperature prediction system. This system describes the thermal regimen of a river or estuary and permits advance estimates of thermal effects of impoundments, single thermal plants or an extended series of thermal and hydro installations with overlapping effects on a single or regionally combined watershed. This paper reviews the basic algorithm employed and the rationale behind this approach. It is concluded that simulation modelling is fully capable of handling most of the potential siting problems which involve joint public and private use of thermal cooling resources. (Upadhyaya-Vanderbilt)

Vsesoyuznyi Nauchno-Issledovatelskii Institut Selskokhozyaistvennoi Mikrobiologii, Leningrad.
Yu V. Kruglov, and L. N. Paromenskaya.
Trans from Mikrobiologiya, Vol 39, No 1, Jan-Feb 1970. Microbiology, Vol 39, No 1, p 139-142, 1970. 1 fig, 2 tab, 10 ref.

Descriptors: *Herbicides, *Pesticides, *Algae, *Toxicity, Soils, Triagine pesticides, Resistance, Cultures, Metabolism.
Identifiers: *Simazine, *Detoxication, Chlorosarcina, Ankistrodesmus braunii, Chlorella vulgaris.

Inoculation of simazine-treated soils with a culture of Chlorosarcina sp suggested a decrease in toxicity of the herbicide, the process being partly influenced by direct solar radiation. The chemical absorbed by Chlorosarcina and Ankistrodesmus braunii was partly metabolized by cells and formed some physiocochemical bond with protein. As shown by C-14 analyses, the strength and nature of this bond vary with the species of algae. Cells of Chlorosarcina, resistant to simazine, retained considerably greater amount of the chemical than did the cells of Ankistrodesmus, sensitive to the herbicide. (Wilde-Wisconsin)

THE SANITARY HISTORY OF CHICAGO,
Henry W. Thurston.
Chicago, Circa 1899-1903. 50 p.

Descriptors: *Water pollution effects, *Diseases, *Epidemics, *Mortality, *Water quality, *Municipal wastes, *Municipal water, *History, *Public health, *Environmental sanitation, *Sewers, *Inspection.
Identifiers: *Chicago, *Sanitary history of Chicago, *Chicago Board of Health.

The author discusses the health problems and diseases prevalent in the City of Chicago from the 1830's to 1900 and relates these to public ignorance of, and unconcern for, sanitation. The average life-span of a Chicagoan in 1872 was 15 years, 2 mos., 10 days. Of 1,826 Chicagoans who died in 1859, 1,070, almost 57%, were under five years old. The high death rates of certain years were associated with epidemics of cholera, smallpox, diptheria, typhoid, erysipelas, scarlet fever, dysentery, and others. A Board of Health, consisting of three members, was provided for by the charter when Chicago became a city in 1837. The erratic operation and existence of the Board is discussed. The total expenditures of the Board in 1851 were $2,131.52, including salaries. The development of a sewer system and a water system together with filling low-lying areas to raise the ground elevation to facilitate gravity flow of sewers, is discussed. Discharge of sewage flows into the Chicago River and Lake Michigan and the use of Lake Michigan and shallow wells as sources of drinking water is described. The actions of city officials in instituting municipal sanitation measures are discussed. Included are sewers, water system, garbage collection, vaccination, burials in regulated cemeteries, stockyards regulations, and inspection of meat, milk, housing and smoke. The most detailed discussions of the article concern sewers. (Poertner-Chicago)

PROCEEDINGS, CONFERENCE ON POLLUTION OF THE INTERSTATE WATERS OF LAKE CHAMPLAIN AND ITS TRIBUTARY BASIN - NEW YORK - VERMONT.

US Dept of Interior, Federal Water Pollution Control Admin, Conference on Pollution of Interstate Waters of Lake Champlain and Its Tribuary Basin New York - Vermont, 1969. 378 p.

Descriptors: *Water pollution control, *Conferences, *Lakes, *Governments, Federal government, New York, Vermont, Lake basins, Lakebeds, Water pollution, Water pollution sources, Water pollution effects, Pollution abatement, Industrial wastes, Statistics, New England, Water pollution treatment, Lake soils, Economics, Law, fisheries, Standards, Impaired water quality, Recreation, Dissolved oxygen, Fishing, Eutrophication.
Identifiers: *Federal Water Pollution Control Act, Water quality criteria.

The Conference was convened pursuant to paragraph 10 of the Federal Water Pollution Control Act to deal with the problem of pollution of Lake Champlain. Federal, New York, and Vermont agencies were represented. The geography and characteristics of the lake basin were discussed in detail. The major area of pollution is toward the southern end of the lake, especially around a large paper factory at Ticonderoga. Specific problems such as sludge deposits, decreased oxygen supply, effect on fishing and recreation, and thermal pollution were discussed. Detailed statistical evidence of the extent of the water pollution was presented and reports were made on the water quality criteria of New York and Vermont. Findings and conclusions were reached on the nature and extent of the pollution problem and remedial measures to be taken. Emphasis was placed on standardizing efforts by New York and Vermont in dealing with with water pollution. (Caldwell-Florida)

entifiers: *Capacity expansion.

part of a sequence of studies utilizing optimiza- and simulation techniques to analyze a variety metropolitan water resource problems, this dy was concerned with the long term effects of sently used and alternatively proposed water cing policies. A discrete deterministic dynamic gramming model was structured and solved to termine the optimal water supply capacity ex- sion paths for a hypothetical and actual tropolitan community. Demand curves, popula- sizes and growth rates for various economic tors of the community were specified, as well as rt run production and capital construction ts. The objective of dynamic programming del was the maximization of future discounted sumers' surpluses plus producer's revenues net the long run cost of supply. State variables were MGD of system capacity and state variables re the years that the feasible capacity increases. e model was structured so that social ferences or weights could be attached to the efit or loss functions of any economic sector, to ck their effect on overall results. Several poli-, including flat rates, constant rate, decreasing increasing block rates and summer differential es were tested. The sensitivity of varying count rates, growth rates and patterns, capacity rement size and timing, and planning horizons examined. It was concluded that price plays a jor role in the long run planning and conserva- of water supplies. (See also W71-07060) iss-Cornell)

APPROACH TO RESERVOIR TEMPERA-RE ANALYSIS,
ps of Engineers, Sacramento, Calif.
. Beard, and R. G. Willey.
ter Resources Research, Vol 6, No 5, p 1335-5, Oct 1970. 11 p, 7 fig, 2 tab, 4 ref.

scriptors: *Water temperature, Reservoir opera-, Solar radiation, *Reservoirs, *Water quality, Stratification, Hydrology, Outflows, Energy transfer, Air temperature, Models, Reservoir evaporation, Inflow, Water resources development, Quality control, Thermocline, Computer programs, *Computer models, Hydrologic data, Reservoir stroage.
Identifiers: Temperature studies.

Several mathematical models for analyzing reservoir temperature stratification involving examination of hourly temperature changes have been developed. Use in practical applications is limited because of large amounts of observational data required. There is an increasing use of reservoir storage for bridging drought periods that requires examination of many combinations of reservoir storage levels and seasonal inflow patterns. Selecting a few representative years for analysis is not possible because 30 or more years of data are required. This approach is practical only if a long computation interval, such as one month, may be used. Observational data needed in existing models are ordinarily not available. A practical model must use generalized data such as average air temperature and average radiation. A generalized model must be capable of making releases through specific outlets or automatically selecting the outlets that will maintain outflow temperatures within a desired range as long as possible and leave the temperature of the remaining stored water at an optimum value. A computer program has been developed that conforms to these requirements and automatically calibrates the model. (USBR)

OPTIMAL PLANS FOR CAPACITY EXPANSION OF WATER-SUPPLYING FACILITIES,
Illinois Univ., Urbana. Water Resources Center.
Hirohide Hinomoto.
Available from the National Technical Information Service as PB-198 521, $3.00 in paper copy, $0.95 in microfiche. Illinois Water Resources Center, Urbana, Research Report No 39, Jan 1971. 59 p, 5 fig, 7 tab, 33 ref, append. OWRR Project S-014-ILL (1).

Descriptors: *Economic feasibility, *Optimum development plans, Facilities, Linear programming, Markov processes, *Water supply, Water treatment, Optimization, distribution systems, Model studies, *Planning, *Costs, Operating costs, Estimated costs, *Storage capacity.

A rapid increase in population accompanied by sustained improvement in living standards has necessitated the consideration of expanding the water treatment and or distribution systems in many areas. To aid in these considerations an economic decision model for selecting optimal expansion plans has been developed. The model formulated is composed of an objective function minimizing the total cost of investment and operation and set of constraints on the treatment and storage capabilities satisfying the annual requirements on the expected maximum daily demand. Equalization during the daily peak period and fire fighting scale effects in the capital and operating costs were represented in the model by exponential functions. Demand was assumed to continuously increase over a finite period beyond which it stays at a maximum level. The original nonlinear formulation was linearized and then applied to the Champaign-Urbana area for demonstration purposes. It was concluded that the usefulness of the model depends much on the availability of reliable information on future demands and the capital and operating costs of the proposed facilities. Furthermore there is a need to more clearly identify the relationship between designing under capacity and the penalty that this decision imposes on the water supplying agency.
W71-07134

STREAM QUALITY MODELING BY QUASILINEARIZATION,
Kansas State Univ., Manhattan. Dept. of Industrial Engineering.
E. Stanley Lee, and Irving Hwang.
Journal Water Pollution Control Federation, Vol 43, No 2, p 306-317, Feb 1971. 12 p, 2 fig, 8 tab, 6 ref. OWRR Project B-015 KAN (5).

Descriptors: *Mathematical models, *Water quality, *Biochemical oxygen demand, *Dissolved oxygen, Water pollution, Path of pollutants, Water pollution effects, Linear programming, Model studies, Numerical analysis.
Identifiers: *Water quality models.

The quasilinearization technique, also known as the generalized Newton-Raphson method, can be used to identify or estimate the parameters in river or stream pollution. The parameters can be estimated directly from the differential equations representing the pollution model and from measured data such as biochemical oxygen demand and dissolved oxygen. Because of the rapid convergence property of this approach, it is a powerful technique for the dynamic modeling of water pollution problems. Several examples are solved to illustrate the technique. With very approximate initial guesses for the unknown parameters, only three to five interations are needed to obtain a four- to five-digit accuracy. (Knapp-USGS)

PRIORITY AND PLANNING ELEMENTS FOR DEVELOPING ILLINOIS WATER RESOURCES.
Illinois State Dept. of Business and Economic Development, Springfield.

Available from the National Technical Information Service as PB-196 814, $3.00 in paper copy, $0.95 in microfiche. May 1970. 53 p, 22 fig, 13 tab. HUD Project No Ill P-260.

Descriptors: *Planning, *Water resources development, *Long-term planning, *Illinois, *Financing, *Administration, *Investment priorities, Analytical techniques, Evaluation, Coordination, Administrative agencies, Water demand, Water quality control, Recreation, Flood damage.
Identifiers: *Guidelines, Implementation techniques.

This is a resume of an in-depth study of the overall planning and administrative considerations relating to water resource developments in Illinois involving possible state financial participation. The report summarizes basic state needs, guidelines and priorities. The priorities guide Illinois investment in major water resource activities involving State programs or developmental responsibilities. State guidelines for administrative evaluation and for expediting specific proposals are clearly defined. These administrative tools are designed to speed accurate evaluation and processing of both state and federal development activities. Coordinated guidelines and a system of priorities are presented to facilitate the administration of federal or state financial assistance to local communities for each of the water resource related programs. Major emphasis is placed on the self-help financial need values. Adoption of the planning, evaluation, and selection procedures by the Illinois Natural Resource Development Board in May 1970 initiates the active use of the proposed implementation techniques by the participating agencies. The comprehensive compilation of technical resource data in the separate technical appendix further serves as a reference bank and inventory base for future water resource activity. (See also W71-07198) (Poertner)

PRIORITY AND PLANNING ELEMENTS FOR DEVELOPING ILLINOIS WATER RESOURCES, TECHNICAL APPENDIX.
Illinois State Dept. of Business and Economic Development, Springfield.

Available from the National Technical Information Service as PB-196 815, $3.00 in paper copy, $0.95 in microfiche. May 1970. 137 p, 32 fig, 43 tab, 48 ref. HUD Project No Ill P-260.

Descriptors: *Planning, *Water resources, *Illinois, *Statistics, *Water supply, *Water demand, *Census, Water utilization, Flood damage, Water quality control, Recreation, Administration, Economics, Investment, Evaluation.
Identifiers: *Water resources statistics, *Water facilities, Data summaries, Water data tabulations.

This Appendix presents the water supply condition for the 1,300 incorporated Illinois communities. Eight regions corresponding roughly, on a county basis, to the river basins are mapped and the summarized data are listed in a table. Tables are also included listing communities where well-capacity or the surface water source could soon become deficient, where filtration plants or pumping capacity can no longer meet increasing demands, and where there are no public water supplies. The report raises many questions which will require further investigation. For instance, actual gallons per capita consumption has been on the increase. How much of this is due possibly to increased leakage as the water system ages can be determined only where all the water is metered. Increased use of wash water in filter systems is tied closely to population increases as is the increased municipal government use of water, most of which is unmetered. Discussions of the data presented in the tables and predictions of future water conditions and requirements are included. (See also W71-07197) (Poertner)

BIBLIOGRAPHY, SELECTED REGIONAL, STATE, AND OTHER GOVERNMENTAL AGENCY WATER RESOURCES PLANNING DOCUMENTS,
Connecticut Office of State Planning, Hartford. Dept. of Finance and Control.
Richard N. Symonds, Jr., and Sidney C. Albertsen.
Available from the National Technical Information Service, as PB-196 623, $3.00 in paper copy, $0.95 in microfiche. Apr 21, 1970. 24 p. HUD Project No P-102.

Descriptors: *Bibliographies, *Publications, *Information retrieval, *Planning, *Water resources development, *Connecticut, Long-term planning, Short-term planning, Sewerage, Water supply, Drainage programs, Flood control, Recreation.
Identifiers: *Planning documents, Regional planning.

This bibliography includes reports and documents relating to water resources planning in Connecticut and is presented in two parts. Part I is a listing of the publications by 'authorizing-agency' categories and 'subject' classifications. Part II is a listing by 'subject' categories and 'authoring-agency' classifications. The bibliography was prepared to fulfill one of the objectives of the Connecticut Water Resources Planning Project which was authorized by Public Act 477 of the 1967 Connecticut General Assembly. The bibliography includes an inventory of selected regional planning agency reports, river basin study reports, and a variety of miscellaneous federal, interstate, and State agency documents. It was prepared to serve as a working document for the staff of the Water Resources Planning Project, but it is being made available to other agencies for information purposes. Reports and publications contained herein are on file with the Connecticut Water Resources Planning Project staff in the Office of State Planning, and can be examined in the office. The listing contained in the bibliography does not necessarily indicate general availability of documents. Some documents are out of print and are not available for distribution while others are available upon request. A total of 103 publications are listed. (Poertner)

Connecticut Office of State Planning, Hartford. Dept. of Finance and Control.

Available from the National Technical Information Service, as PB-196 621, $3.00 in paper copy, $0.95 in microfiche. Apr 21, 1970. 5 p, 1 fig, 1 tab. HUD Project No P-102.

Descriptors: *Planning, *Long-term planning, *Short-term planning, *Water resources development, *Connecticut, Sewerage, Water supply, Project planning.
Identifiers: *Regional planning agencies.

Progress made in developing a statewide long range plan for the management of water resources in Connecticut and in preparing regional sewer and water facilities plans is summarized. Public Act 477 of the 1967 General Assembly, together with amendments to the Act passed in 1969, authorized this work and provided $1,500,00 of bond issue funds. The Act designates that the plans be prepared jointly by the Water Resources Commission, the State Health Department, the State Board of Fisheries and Game and the Connecticut Development Commission. An Interagency Water Resources Planning Board was created to carry out the requirements of the Act. The Office of State Planning is the contracting and administrative agency for the Board. The following has been accomplished: inventoried recreational, water supply, sewerage and flood control facilities along with uses and needs relating to Connecticut water resources; prepared work maps, charts and graphs; inventoried files and listings of planning materials and documents on Connecticut water resources; evaluated the water supply and sewer requirements of the four alternative planning concepts for future land use prepared by the Connecticut Interregional Planning Program; and evaluated Regional Planning Agency recommendations to determine interregional and statewide implications. Major work remaining includes: immediate and long range water resources plans; specific recommendations and proposals; and a statewide long range plan for the management of the States' water resources. DOWNTOWN: AN ECONOMIC-ENVIRONMENTAL SIMULATION GAME,
Pennsylvania State Univ., University Park.
Wesley H. Long.
Reprint Series No 17 from: Proceedings of the Second Annual Environmental Design Research Association Conference, Pittsburgh, Pennsylvania, Oct 1970. 8 p, 5 tab, 1 fig.

Descriptors: *Urbanization, Environment, Economics, City planning.
Identifiers: *Economic-Environmental simulation game, Town council, Metropolitan Areas, Urban environment.

This game is designed to bring out interactions among economic and environmental decisions. Teams have economic interests focused by their roles in the game and environmental interests focused by their habitation locations in a town. They vie individually through exchange and collectively through an elected Town Council to achieve economic gain and an improved environment. Conflicts encountered between teams and Town Council when they attempt to realize both the goals simultaneously replicate in miniature and in a collapsed time frame the strains and tensions experienced by a real community. (Wray-Chicago)

ON THE EXTENSION OF INPUT-OUTPUT ANALYSIS TO ACCOUNT FOR ENVIRONMENTAL EXTERNALITIES,
Dartmouth Coll., Hanover, N.H.
A. O. Converse.
American Economic Review, Vol LXI, No 1, 197-198, Mar 1971.

Descriptors: *Input-output analysis, *Economi analysis, *Environment, *Pollution, Wastes, Taxe Government, Capital, Investment, Conservatio Waste treatment, Social aspects.
Identifiers: *Ayres-Kneese model, Consumptio activities, Residuals, Pollution tax.

The Ayres-Kneese model of input-output analysis extended. The model had been originally extende to include the flow of wastes to the environme and the recycle flow of wastes to the productio sectors by adding two sectors of consumption a environment. The author further extends th model after showing that, as presented above, it d not correctly account for the individual was residues from the various production secto Changes are proposed to alter this situation, inclu ing a change which permits accounting for the va ous types of waste residue from both productio and consumption activities. This last change bei necessitated by specific residue activities. It pointed out that such treatment while changing t composition of the waste residues increases t total amount of them, rendering pollution analy of total residue useless for pollution control pu poses. For this reason, this article is especially u ful for efficient pollution analysis, and therefo optimal pollution control measures of environme tal factors. (Murphy-Rutgers)

A BARGAINING MODEL OF THE PU THEORY OF PUBLIC EXPENDITURE,
York Univ. (England).
Shibata Hirofumi.
Journal of Political Economy, Vol 79, No 1, p 1-2 Jan-Feb 1971.

Descriptors: *Government, Optimization, Incon Social aspects, Budgets, Model studies, Tax Cost, Marginal costs, Government supports, W fare economics.
Identifiers: *Public goods, *Public expenditure, lateral monopoly, Behavioral assumptions, Pare optimality, Isoguants, Externalities.

This article presents a geometric analysis of pu goods similar to that of bilateral monopoly after dicating the essential identity of the two theorie the typical bargaining between a few self-interes parties contracting in the absence of external pu sure. The article first demonstrates that the pu theory of public expenditure formalized in terms a collective-consumption (or public) good can shown diagramatically similar to a case of bilate monopoly. The author then relates the diagra matic exposition of the determination of public penditure to earlier studies in the area to show t their different implicit behavioral assumptions to blame for the disagreements. Finally the pa limits the range of possible equilibrium solution terms of public and private product mix and the bill distribution for certain cases, including relative marginal costs of public expenditure. T step is necessary to avoid the result of multi solutions unless other nonconomic variables introduced. This article is relevant to water stu because of its theoretical insights into public go and expenditures issues. (Murphy-Rutgers)

PARETO, PUBLIC GOODS AND POLITICS,
McMaster Univ., Hamilton (Ontario).
David M. Winch.
Canadian Journal of Economics, Vol 2, No 4 492-508, Nov 1969.

Descriptors: *Resource allocation, Wel economics, Taxes, Decision-making.

entifiers: *Pareto optimum, Equity, Income distribution, Public good, Benefit taxation.

is article examines the consequences of a Pare- n value judgment on a model encompassing both ivate and public goods. Distribution must be de- ded first and be imposed by government, while al- cation between private and public goods depends the nature of the utility function. The author ex- ores the possibility of determining the optimum lue of public goods through the democratic litical process or majority rule. Majority rule aches an equilibrium allocation but the sub- quent allocation is not optimal. Political system olving pressure groups, propaganda, vote trad- and bribery can lead to a Pareto optimum ult. These conclusions are interpreted as point- out the dangers of confusing equitable income tribution and optimal resource allocation. This per is relevant to water research concerned with theoretical aspects of the role of equity criteria decision making. (Siegenthaler-Rutgers)

INT GOODS,
ns Hopkins Univ., Baltimore, Md.
lliam H. Oakland.
onomica, Vol XXXVI, No 143, p 253-268, Aug 69.

scriptors: *Resource allocation, *Welfare nomics, Taxes.
ntifiers: *Externality, Subsidy, Joint good, reto optimality, Public good, Social cost, Social efit.

is paper considers a generalization and extension Samuelson's public goods analysis to goods for ich jointness in consumption is not complete. nt goods share some of the features of both vate and public goods and the analysis of joint ods is most suitable for the problem of externali- in consumption. The conditions for Pareto op- ality for joint goods differ from the public goods e and involve restrictions upon the pattern of ect consumption by individuals. Since the mar- economy does not generate a Pareto optimal ution for joint goods, the author suggests the vernment use a pricing scheme based on taxes subsidies to satisfied Pareto conditions. This cing policy is based upon information concern- the marginal rate of substitution between direct indirect consumption. Finally, the provisions of t goods within a federal system is analyzed ng with optimal policy for grants-in-aid to the es. This paper is relevant to water research con- ned with the theory of public expenditure and ation. (Siegenthaler-Rutgers)

OTE ON THE DYNAMIC PLANNING OF IN- STMENT PROJECTS,
chnion - Israel Inst. of Tech., Haifa; and Mon- l Univ. (Quebec).
rdechai Shechter, and Peter L. Hammer.
ropean Economic Review, Vol 2, No 1, p 111- , Fall 1970.

scriptors: *Decision making, Non-linear pro- mming, Budget constraint, Economic evalua- , Cost, Discount rate.
ntifiers: *Dynamic planning, Capital budgeting, ective function, Present value, Boolean nique.

s paper considers the problems of optimally cting investment projects with a finite planning izon using a non-linear programming model. s formulation allows the author to consider plex problems without restricting the analysis nodels involving only linear constraints and ob- ive functions. The author first considers a one od capital budgeting model which is formulated naximizing the net present value of the benefits ject to budget constraints. The more general e of time dependent capital budgeting is then ussed with constraint equations composed of technological and budget dependencies. An outline of the solution method to this model is given using Boolean techniques. The author uses as an example the case of three independent projects and then illustrates how the non-linear programming method generates an optimal solution. This article is relevant to water research concerned with capital budgeting analysis. (Siegenthaler-Rutgers)

QUASILINEARIZATION AND THE IDENTIFICATION OF AQUIFER PARAMETERS,
California Univ., Los Angeles. Dept. of Engineering Systems.
William W-G. Yeh, and George W. Tauxe.
Calif Univ Water Resources Center Project W290. Water Resources Research, Vol 7, No 2, p 375-381, Apr 1971. 7 p, 2 fig, 3 tab, 10 ref.

Descriptors: *Parametric hydrology, *Linear programming, *Mathematical models, *Aquifer characteristics, Simulation analysis, Computer programs, Storage coefficient, Transmissivity, Confined water, Systems analysis, Data processing.
Identifiers: Quasilinearization.

A new computational procedure based on observations at observation wells is presented to solve the problem of identifying aquifer parameters. This new procedure (quasilinearization), is an effective way to convert the observations directly to aquifer parameters. The procedure is advantageous because it involves neither curve plotting nor graphical matching. It makes full use of the ability of the modern high speed digital computer to integrate a system of ordinary differential equations with given initial conditions. The parameters to be identified are the storage coefficient and transmissivity in a confined aquifer system. (Knapp-USGS)

A COURSE OF LECTURES ON PARAMETRIC OR ANALYTICAL HYDROLOGY,
University Coll., Galway (Ireland).
J. E. Nash.
Great Lakes Institute, University of Toronto, P R 38, 1968-1969. 177 p, 64 fig, 3 tab, 5 append, 30 ref.

Descriptors: *Hydrology, *Analytical techniques, *Parametric hydrology, *Systems analysis, *Optimization, *Unit hydrographs, *Frequency analysis, Runoff.
Identifiers: *Linear hydrologic system, Conceptual models.

This paper presented the 15 lectures given by the author on Parametric or Analytical Hydrology at the Universities of Ontario. Included in the subjects of these lectures were: applied hydrology; systems and the operation method; lumped time-invariant linear system, in respect to convolution, and continuity, stability, damping; hydrologic systems; discrete expression of convolution; and unit hydrograph computation. A general linear hydrologic system was described in detail. The relationship between the unit hydrograph and the catchment was investigated and many different approaches were cited. An explanation of the use of conceptual models of the runoff process was given and such operations as optimization and sampling variance were noted. The last of the lectures dealt with hydrologic frequency prediction, specifically prediction from samples, indirect prediction and use of inference methods. The appendices provide some additional operational techniques. (Kriss-Cornell)

SOCIO-ECONOMIC SIMULATION FOR WATER RESOURCE SYSTEM PLANNING,
Department of Energy, Mines and Resources, Ottawa (Ontario). Policy and Planning Research Branch.
Peter J. Reynolds, and Asit K. Biswas.
Report, Resources Research Centre, Policy and Planning Branch, Dep of Energy, Mines and Resources, Ottawa, Canada, 1969. 8 p, 23 ref.

Descriptors: *Simulation analysis, *Water resources, *Planning, *Forecasting, *Decision making, Economics, Resource allocation, Government supports, Evaluation.
Identifiers: Regional models, Economic behavior, Socio-economic models.

The current status of socio-economic simulation in water resource planning was examined. Two broad subsystems in water resource planning were distinguished: the physical-technologic subsystem and the socio-economic subsystem. By selecting the significant variables in a given economy, and analyzing the interaction between them, it was possible to develop economic models which would be of great value in interpreting, if not predicting, economic behavior of the real world. Regional economic models provided a better structural understanding of the complex processes of economic and behavioral interactions within a system, as well as making possible regional forecasts. These in turn, provided guidelines for better policy planning and decision making. Three problem-oriented models were discussed: the Lehigh, Ohio, and Susquehanna basins. Efficient allocation of limited national resources among competing government programs was achieved by the measurement of their relative cost effectiveness. This could be done by the evaluation of social, political and economic effects on human beings, using national and regional socio-economic models. (Thiuri-Cornell)

CONSIDERED LAKE ERIE-LAKE ONTARIO WATERWAY; HYDRAULIC MODEL INVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
T. E. Murphy.
Sponsored by US Army Engineer District, Buffalo. US Army Engineer Waterways Experiment Station, Vicksburg, Mississippi, Technical Report H-70-3, Apr 1970. 14 p, 8 tab, 8 photo, 10 pl.

Descriptors: *Inland waterways, *Hydraulic models, Navigation conditions, Locks.
Identifiers: *Lake Erie-Lake Ontario Waterway.

Investigation was conducted to assist in determination of the economic justification of a water route connecting Lake Erie and Lake Ontario. Specifically, the studies involved determination of the most functional and economical location for a lock in the vicinity of Buffalo, N.Y., and evaluation of navigation conditions at the entrance to an overland canal joining the American channel of the Niagara River northwest of North Tonawanda, N.Y. An existing model of the Niagara River with a horizontal scale of 1:360 and a vertical scale of 1:60 and a new undistorted model of the canal entrance with a 1:120 scale were used in the investigation. Tests demonstrated the desirability of placing the new lock in the vicinity of Buffalo as far downstream as is feasible without rendering the existing Black Rock Lock and Canal inoperable during the construction period. Navigation problems at the canal entrance were not as severe as had been contemplated and a small amount of overexcavation resulted in satisfactory conditions. (Murphy-WES)

THE UNIVERSITY'S ROLE IN NATIONAL WATER POLICY.

Flack, J. Ernest, Editor. Proceedings of Universities Council on Water Resources Conference, July 27-28, 1970, Blacksburg, Virginia, 1970. 128 p, 3 append.

Descriptors: *Conferences, *Water resources development, *Universities, Water resources research act, Training, Research and development, Planning, Economics, Social aspects, Social impact, Education, Management, Water management (Applied), Water demand.
Identifiers: *Universities Council on Water Resources.

The Universities Council on Water Resources is an organization of universities that are active in both graduate education and research in water resources. The aim of the Council is to encourage education and research in these areas and to provide a clearing house for information as well as a forum for discussion of questions of mutual interest. This conference proceedings is the record of one of a series of meetings that have been held annually since 1965. The topics discussed include national water policy, planning, education, research, sociology, land-water relations, hydrology, water quality, and water resources engineering. (Knapp-USGS)

INFORMATION FOR THE FUTURE: THE WEST SIDE SAN JOAQUIN VALLEY PROJECT.
California Univ., Los Angeles. Water Resources Center.

Partially supported by Water Resources Center, Univ of Calif and by Dept of Housing and Urban Development. West Side San Joaquin Valley Coordinating Council, California University Water Resources Center Report No 20, Sept 1970. 22 p, 1 fig, 2 map, 2 photo, 1 tab. Project W-187.

Descriptors: *Environmental engineering, *California, *Water resources development, Land development, Economics, Valleys, Agriculture, Recreation, Population, Education, Projects, Planning, Reviews.
Identifiers: *San Joaquin Valley (Calif).

Long-term plans among California's institutions of higher education, the state and local governments, and public, private, and voluntary organizations for developing the San Joaquin Valley are summarized. Issues such as the following are among those to be examined in the proposed study: Potential impacts of new water and transportation links that are being built now through the West Side of the Valley and their possible effects on the Valley's ecology, public service systems, industries, and social environment. Location, magnitude, characteristics, and effects of possible new population growth in the Valley; and Public and private policy alternatives that might assure Valley residents that their future will not be overcrowded, polluted, or conflict ridden in the manner that already has blighted some other developing areas of the United States. CRISIS IN WATER SUPPLY,
David Clutterbuck.
New Scientist and Science Journal, Vol 49, No 743, p 624-627, Mar 18, 1971. 4 p, 2 fig, 2 photo.

Descriptors: *Water supply, *Water shortage, *Water resources development, Surface waters, Groundwater, Water storage, Reservoirs, Water demand, Water consumption, Aquifers, Injection wells, Recharge wells.
Identifiers: *England.

Large areas of Britain are on the verge of acute water shortage, resulting from the disruption of supply programs, and there are no short term remedies. Britain is not a wet country. In Europe, only Malta has a lower mean annual rainfall. Reservoirs are responsible for only a minute fraction of the agricultural land appropriated for other uses each year, but they are vulnerable to public criticism because the land they use is concentrated into a few large plots. Until recently most undertakings were able to draw on their surpluses, but these have been gradually eroded by increasing demand, and shortages in some areas are beginning to assume crisis proportions. Too great a lowering of the water table increases the risk of infiltration by seawater--which, in this case, has already begun. The Water Resources Board, which at present has only an advisory status, wants the power to organize national water supplies on a mandatory basis. (Woodard-USGS)

WATER FOR THE FUTURE OF LONG ISLAND NEW YORK,
Geological Survey, Albany, N. Y.
Philip Cohen, O. L. Franke, and B. L. Foxworthy.
New York Water Resources Bulletin 62A, 1970. 3 p, 14 plate.

Descriptors: *Water management (Applied *Water resources development, *New Yor Water resources, Groundwater, Surface water Aquifers, Saline water intrusion, Artificia recharge, Safe yield, Water wells.
Identifiers: *Long Island (NY).

This booklet summarizes the water resources Long Island, N. Y., and emphasizes some of the di ferent approaches that might be taken in managin the water resources of Long Island. Water-manag ment objectives, ranging from very general to ve specific, should be clearly and precisely define All the alternative methods of achieving these ob jectives should be recognized. Many alternati methods of development are, to some extent, sel defeating. For example, the construction of sewe to prevent pollution from cesspools and dispos basins could substantially decrease artifici recharge and, therefore, might accelerate pollutio by encroaching salt water. Likewise, artifici recharge using reclaimed sewage water may he alleviate the problem of salt-water intrusion, but also ultimately could cause an undesirable increa in the dissolved-solids content of the groundwate Other alternatives, ranging from desalination of s water (or of salty groundwater from the zone of di fusion) using atomic energy, to a recent propos for converting Long Island Sound into a huge fres water reservoir, must be carefully considered. A NEW LOOK AT NATIONAL WATER POLICY,
National Water Commission, Arlington, Va.
Theodore M. Schad.
In: Implementation of Regional Research in Water-Related Problems, Report of a seminar, University of Wisconsin, p 61-70, 1970. 5 ref.

Descriptors: *Federal government, *Planning, Water resource development, Regions, Interstate, *Water policy.
Identifiers: *National Water Commission, Colorado River Basin.

The National Water Commission's tasks and progress during its first year of activation are described. Established in September 1968, the National Water Commission is charged with the task of 'preparing a report on the nation's water needs and making recommendations simultaneously to the President and the United States Congress as to how these needs can best be met.' By holding conferences throughout the country, the Commission has attempted to identify the problems that are most important to the public. In addition, the Commission has attempted to tap the minds of as many of the leading water authorities as possible and has initiated new studies on several important aspects of water resources problems. The Commission will submit its report in 1973. (Holmes-Rutgers)
